YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

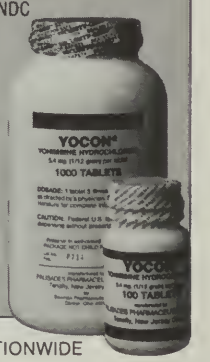
Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.



Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

HIV infection in Maryland public psychiatric facilities: Results of an informal survey

Constantine G. Lyketsos, M.D.; Daniel D. Storch, M.D.; Helen D. Lann, M.D.; Rolfe Finn, M.D.; Richard Haber, M.D.; and Ralph Meng, M.D.

Dr. Lyketsos is assistant director of the AIDS Psychiatry Service, and senior fellow in psychiatry and mental hygiene, Johns Hopkins University. Dr. Storch is assistant professor of psychiatry, Walter P. Carter Center, University of Maryland. Dr. Lann is assistant professor of psychiatry, University of Maryland, and director, Howard County Community Health. Dr. Finn is assistant professor of psychiatry, and acting clinical director, Walter P. Carter Center, University of Maryland. Dr. Haber is a staff psychiatrist, Baltimore County Medical Health Services. Dr. Meng is a psychiatrist at the Upper Shore Community Mental Health Center in Chestertown.

ABSTRACT: *The Maryland Psychiatric Society (MPS) Public Psychiatry Committee, concerned with the preparedness of Baltimore mental health facilities to deal with the accelerating human immunodeficiency virus (HIV) epidemic, surveyed public sector mental health facilities. The survey results indicated that the number of HIV-infected patients is greatly underestimated. Care providers acknowledged awareness of the problem and wanted more education.*

The human immunodeficency virus (HIV) epidemic continues to spread rapidly. The Centers for Disease Control and Prevention (CDC) estimates that over 1% of the US population—more than 2 million persons—have been infected with the virus.[1] Over 200,000 acquired immunodeficiency virus (AIDS) cases have been reported nationwide since the beginning of the epidemic, half in the last two years.[2] Mortality from AIDS is approaching 100%.[1] In Maryland, over 4,000 AIDS cases have been reported, and it is estimated that another 16,000 Marylanders are infected.[3]

While homosexual men, intravenous drug users, and hemophiliacs still account for the majority of cases, the rate of contraction through heterosexual intercourse is increasing and now accounts for almost one-third of newly diagnosed HIV infections in Baltimore sexually transmitted disease clinics.[4]

The chronically mentally ill comprise a high-risk population for contracting HIV.[5–12] Factors making them especially vulnerable include impulsiveness, impaired judgment, self-destructive behavior, hypersexuality, cognitive impairment, poor reality testing, affective instability, intravenous drug use, vulnerability to victimization, and consequences of low socioeconomic lifestyle and environment. HIV risk behaviors in the chronically mentally ill population are alarmingly high.[5–7,10,11] Coupled with these

vulnerabilities is a disturbingly low level of patient knowledge about risk factors.[5,7,8] A recent survey reported that 43% of patients provided an incorrect response to the following true-false statement: "Women can't get AIDS if they have sex only with men."; 38% incorrectly responded to "Men can't get AIDS if they have sex only with women"; and 45% incorrectly responded to "People who give you the AIDS virus always look sick."[5] Education can help.[7-9]

The HIV prevalence rate among the chronically mentally ill is being studied. Blood sample studies in some New York City hospitals report that 5% to 8% of patients are HIV positive.[6,13] Studies also suggest clinicians were unaware of most cases, even though most HIV-positive individuals acknowledged high-risk factors.[6,10,11]

The Maryland Psychiatric Society (MPS) Public Psychiatry Committee became interested in the preparedness of Baltimore area mental health facilities to recognize and deal with HIV and its psychiatric sequelae. The committee surveyed medical directors of public-sector mental-health facilities to open a dialogue on HIV matters with local members of the profession.

Method

An eight-question, one-page survey was mailed with a stamped return envelope to medical directors of 24 inpatient and outpatient public sector mental health facilities in the Baltimore metropolitan area. Veterans Affairs facilities were inadvertently omitted. Surveys were also distributed on the Eastern Shore for comparison purposes. Committee members phoned medical directors who did not return the form within two to four weeks.

Results

Eighteen of 24 surveys (75%) were returned. Summary answers to questions are presented in **Table 1**. The estimated hospital prevalence of HIV-positive patients ranged from 0% to 2.6%; the overall rate was 2%. One of the largest state hospitals reported no HIV-positive patients.

As expected, rates from county clinics were lower than inpatient and city clinics. The vast majority of facilities appropriately recommended HIV testing to high-risk patients. While inpatient facilities reported a great deal of preparedness, outpatient facilities gave mixed responses.

Surveys were received from three county health departments and one inpatient facility on the Eastern Shore. Reportedly, no HIV-positive patients are currently being seen, and only one HIV-positive patient was hospitalized in the past. The majority of facilities and psychiatrists do not think they are adequately prepared, and all want educational programs.

At approximately the same time, another study was conducted at a small state facility in Baltimore City by Dr. David Stewart and Joan Ingle, University of Maryland Department of Family Medicine, and Samuel Groseclose and Claudia Zuckerman, Baltimore City Health Department. In that study, HIV testing on discarded blood samples of 534 patients showed an HIV-positive rate of 5.8%. Excluding children, adolescents, and outpatients, the percentage of adult inpatients with HIV was 6.8%. In our survey, the medical director of this facility

Table 1. Responses to individual questions by facility directors in metropolitan Baltimore.

	Inpatient (N=4)	Outpatient City (N=5)	Outpatient Counties (N=9)
❑ How many patients currently at your facility are known to be HIV-positive or suffer from AIDS?	27/1,477 2%	98/5,600 2%	29/6,327 0.5%
❑ Do caregivers in your facility routinely recommend HIV testing for patients who are at high risk for infection?	3 Yes 1 No	4 Yes 1 No	9 Yes 0 No
❑ Do you have special programs directed mainly at patients with HIV/AIDS?	4 Yes 0 No	2 Yes 3 No	3 Yes 5 No
❑ Do you feel that your faciltiy is adequately prepared to diagnose and treat the mental health needs of HIV patients?	4 Yes 0 No	2 Yes 3 No	5 Yes 4 No
❑ Do the psychiatrists at your facility feel adequately educated about HIV and prepared to care for HIV/AIDS patients?	4 Yes 0 No	2 Yes 3 No	5 Yes 4 No
❑ Do you feel your facility would benefit from educational programs about the HIV epidemic and the psychiatric care of infected patients?	4 Yes 0 No	5 Yes 0 No	8 Yes 1 Maybe

estimated 2.6%. Even though this was the highest estimate of prevalence by any medical director, it is still less than half (38% to 44%) the figure found by blood tests.

Discussion

Directors of state and county public-sector mental-health facilities in metropolitan Baltimore greatly underestimate the number of HIV-infected patients at their facilities. Since the infection rate is high and increasing, and since aggressive education and prevention campaigns and early treatment can make a difference, psychiatrists may be unwittingly contributing to the problem by minimizing and denying the extent of the epidemic. This is natural considering the enormity and overwhelming nature of the situation, and the personal fears it raises.

Our survey did, however, show that there was some awareness of the problem. Half of respondents reported their clinics were inadequately prepared. Half also reported that psychiatrists do not think they are adequately educated or prepared to care for HIV and AIDS patients. All respondents indicated their facilities would benefit from education programs.

Regularly updated education that teaches practical medical and psychiatric care of HIV-infected patients should be offered to public-sector psychiatrists. The AIDS services at the University of Maryland, Johns Hopkins Hospital, and the Maryland Department of Health and Mental Hygiene (DHMH) AIDS Administration are sources for education programs.

Another education option is a curriculum being developed under the direction of Carol Svoboda, through the American Psychiatric Association AIDS Education Project, which is funded by the National Institute of Mental Health (NIMH). MPS is also discussing hosting a conference in the Baltimore area.

MPS also plans support of a joint grant proposal by the University of Maryland Department of Psychiatry and the Maryland AIDS Professional Educational Center, in close collaboration with the Johns Hopkins Hospital AIDS Services, to provide training to students and practitioners at University of Maryland professional schools, DHMH facilities, and others desirous of HIV training.

Our survey addressed knowledge and awareness at public facilities. Similar issues need to be addressed at private psychiatric facilities, where confidentiality and secrecy may be greater and where the medical aspects of AIDS may, at times, be left unattended. The AIDS epidemic affects us all.

Two Reasons Why You Should Refer Your Patients To Accessible MRI:

1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.

We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

Intravenous immunoglobulin in Henoch-Schönlein purpura: A case study

Fred J. Heldrich, M.D.; Sanford Minkin, M.D.; and Cristeta L. Gatdula, M.D.

From the Johns Hopkins University School of Medicine where Dr. Heldrich is associate professor of pediatrics, and from St. Agnes Hospital where Dr. Minkin is chief of diagnostic ultrasound and Dr. Gatdula is an attending pediatrician.

ABSTRACT: *A five-year-old girl with severe abdominal pain secondary to Henoch-Schönlein purpura (HSP) was given steroid therapy. Symptoms continued to recur. Intravenous immunoglobulin (IVGG) use was followed by cessation of symptoms. Further studies with IVGG in HSP are warranted.*

A five-year-old white female with the diagnosis of Henoch-Schönlein purpura (HSP) was admitted four times over a period of one month because of severe, recurrent abdominal pain. On the initial admission, symptoms were arthralgia with periarticular swelling involving knees and ankles, a limping gait, and purpuric lesions over the lower extremities and buttocks. Therapy was symptomatic. The three subsequent admissions were because of colicky abdominal pain, melena, and recurrence of the purpuric rash. Hematocrits, red blood cell indices, white cell count, and sedimentation rate were normal. Serum immunoglobulin G (IgG), immunoglobulin M (IgM), and immunoglobulin A (IgA), complement, electrolytes, blood urea nitrogen, and creatinine were normal. There was no hematuria. Cultures of throat and urine were negative. Occult blood in the stool and a persistent thrombocytosis as high as 824,000 was consistent with the clinical diagnosis of HSP with involvement of the gastrointestinal tract.[1]

On the second and third admissions, barium enemas and upper gastrointestinal series excluded intussusception. On the second admission, steroids were started (2 mg/kg/24 hrs); symptoms subsided after seven days, and the steroid dose was reduced to 1 mg/kg/24 hrs. Six days later, the patient experienced a recurrence of symptoms. She was readmitted, and full-dose steroid therapy reinstated. Again, symptoms abated and the steroid dose was reduced. Twenty-seven days after her illness began, there was a fourth admission for exacerbation of symptoms including colicky abdominal pain, melena, and recrudescence of purpuric skin lesions. Twenty-four hours after this admission, immunoglobulin was given intravenously (400 mg/kg/day) for four days. Symptoms subsided with no further recurrence during a year

of follow-up (**Figure 1**). Sonography prior to initiating immunoglobulin therapy revealed bowel wall thickening (**Figure 2**). A sonogram obtained the day after completion of the immunoglobulin therapy showed resolution of bowel wall edema (**Figure 3**).

Discussion

Henoch-Schönlein disease is a vasculitis of undetermined etiology, usually involving small blood vessels in various organ systems. The typical clinical presentation includes nonthrombocytic purpura, arthralgia, gastrointestinal pain with or without melena, and renal involvement.[2]

One complication of gastrointestinal involvement is intussusception. An attempt to prevent this potential complication has led to the use of steroids in HSP patients who develop intermittent, colicky abdominal pain with melena. No controlled studies demonstrate the efficacy of steroids in HSP; only favorable anecdotal experiences contribute to continued steroid use.[3] In our patient, the failure of steroids to prevent severe recurrent abdominal pain and melena led to a consideration of other therapeutic possibilities.

Intravenous immune globulin has been used in an ever-growing number of clinical diseases.[4] Notable success has been reported in Kawasaki's disease, an entity that also has vasculitis as the dominant pathologic lesion.[5,6] Although the mechanism of action for intravenous immunoglobulin therapy is unknown in patients with vasculitis as the primary pathologic entity, possible mechanisms include suppression of antibody synthesis, blockage of antiendothelial factors, modulation of inflammation, or neutralization of an unidentified infectious agent.[7] Because of this, we elected to use intravenous gamma globulin in our patient.

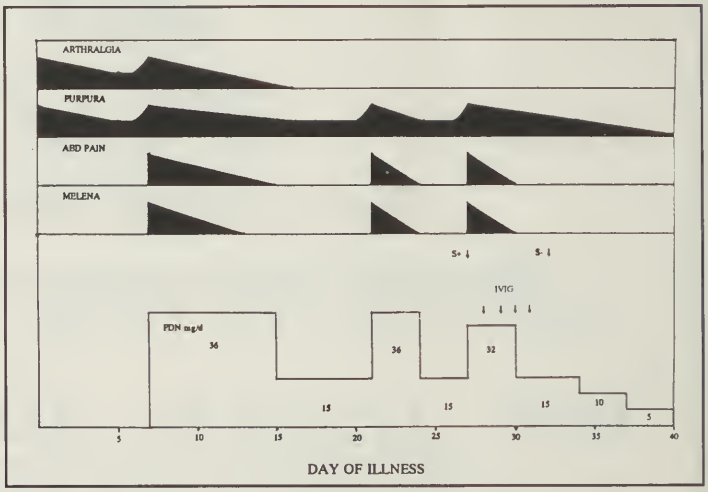

Figure 1. Clinical course showing response to prednisone and intravenous gamma globulin. Purpura, abdominal pain, and melena recurred when the prednisone (PDN) dose was tapered. The sonogram (S) was positive prior to giving intravenous immunoglobulin (IVIG), but negative 24 hours after the fourth dose. No new purpuric lesions appeared, and abdominal pain and melena did not recur.

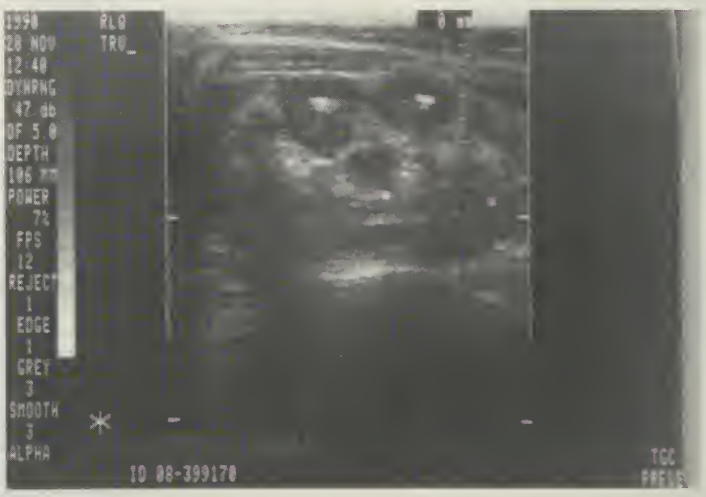

Figure 2. Transverse sonogram of the right lower quadrant on November 28, 1990, prior to the initiation of immunoglobulin therapy, with three circular lucent areas demonstrating abnormal bowel wall thickening. The abdomen was tender when pressure was applied over this area.

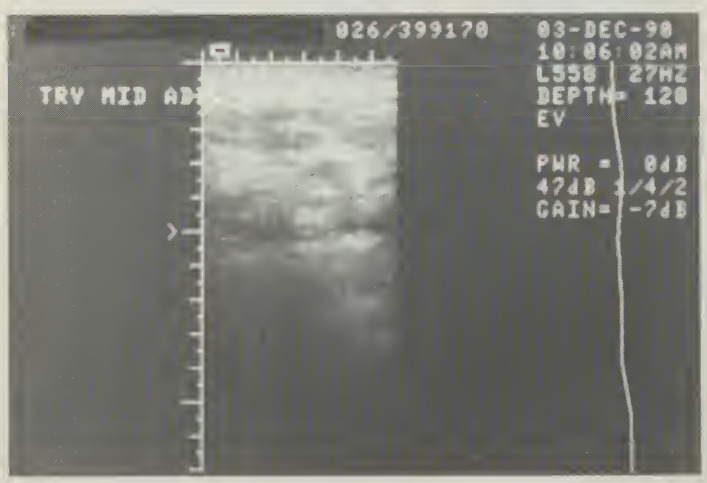

Figure 3. Follow-up sonogram of the same area as shown on December 3, 1990, the day following cessation of the immunoglobulin therapy. Normal-appearing bowel is evident.

While our experience is limited to only one patient, the objective findings of resolution of bowel wall edema on ultrasound, plus resolution of the patient's symptoms, lead us to believe that further clinical trials of intravenous immune globulin in patients with HSP are warranted.

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

Vignette of medical history: Queen Victoria and hemophilia

Joseph M. Miller, M.D. and K. Scott Miller, M.D.

Dr. J. M. Miller is a retired surgeon from Timonium, Maryland. Dr. K.S. Miller is an internist and clinical associate professor in Charleston, South Carolina.

Saxe-Coburg, comprising the Gotha and Coburg provinces, was a small dukedom of the first German Reich with an area of only 763 square miles on the south side of the Thuringia forest. The natives exported many of their manufactured goods, among which were meerschaum pipes and cigar holders.

The duchy sent abroad more than fabricated goods, however, as members of the ruling family made a definite effort to marry above themselves. The family was discriminatory and pursued the marriage brokerage business relentlessly. Occasionally, misfortune occurred as when, in 1816, Leopold of Coburg married Charlotte, the only daughter of George IV; she died the following year. Leopold became king of the Belgians in 1831, however, and subsequently, one of his daughters became the empress of Mexico, and a nephew married the queen of Portugal.

One of the family's great triumphs was the marriage of Queen Victoria to Prince Albert of Saxe-Coburg. Indeed, Victoria's mother, who also was a member of Coburg royalty and who carried the hemophilia trait, married the duke of Kent, the fourth son of George III, after losing her first husband. Queen Victoria was the only child of this marriage. By 1850, the impoverished House of Coburg had extended its grasp over a wide area of Europe. The duchy's ruling family reached its zenith of power in 1901 when it had provided nine contemporaneous sovereigns in Europe. Unfortunately, the family also passed on the recessive hemophilia gene with these marriages.

The genetics of hemophilia, a rare hereditary bleeding disorder caused by an abnormal X chromosome, are now well understood. In practically all instances, males express the disease, while females are the carriers. Goodman reports a prevalence of between 1.9 and 10 per 1,000 males.[1] The carrier rate is unknown.

Hemophilia is an ancient disease. Talmudic literature mentions its existence 2,000 years ago on the grazing lands between the Euphrates and the Tigris rivers.[2] Although the aged Hebrews did not leave medical texts, they did bequeath therapeutic knowledge embalmed in sacred, historical, and legal literature; the Babylonian Talmud is an encyclopedic

corpus and monument of Jewish cultural history. It was not, however, until the publication of the well-known text by Preuss, who was a well-educated doctor and brilliant Biblical scholar, that the reference to hemophilia was thoroughly documented.

In those early times, the greatest caution was exerted if a bleeding problem was expected. Rabbinical advice was that if two sons died as a result of circumcision, the operation should not be performed on a third or fourth son. The same concept applied in the case of four sisters; if one son of each of three sisters died due to circumcision, then the fourth sister's son need not be circumcised. These Jewish guidelines agreed with existing medical knowledge that such bleeding nearly always occurred in males, but was transmitted through females.

Metterlink, Victoria, and Bismark were the geographical architects and influence peddlers in Europe during the 19th century. Victoria entered the game with gusto and, because royalty could only marry royalty as morganatic marriages were frowned upon (see *Word Rounds*, page 597), this powerful individual became the grandmother of Europe. In arranged marriages, love was overshadowed by parental and governmental demand and persuasion. Victoria thereby passed her "bad" gene to many of her descendants **(Figure 1).**

Interestingly, Victoria arrived at the throne in a circuitous fashion. George IV did not have heirs, nor did his two brothers who were next in line for the throne. This brought the duke of Kent (William IV, brother of George IV) and his daughter, Victoria, to the fore. In 1825, Parliament recognized her as the successor to William IV.

Victoria and Albert had nine children between 1840 and 1857, five daughters and four sons.[3] Two daughters were known to be carriers, and one son had hemophilia from which he died. At the time of Victoria's death, 31 of her 40 grandchildren and 37 great-grandchildren were alive. As soon as any of Victoria's grandchildren became of marriageable age, she became interested in the quest for a suitable partner. Royal lines were established with Germany, Norway, Sweden, Spain, Greece, and Romania. Individuals in Great Britain, Germany, Russia, and Spain had either the trait or the disease as a result of the arranged marriages.

Hemophilia was introduced into the Romanov family by the marriage of Alice (nicknamed Alix), a granddaughter of Victoria, to Nicholas, who became the tsar of Russia.[4] Five children were born to the couple, with the first four being daughters and the last, a son with hemophilia. In March 1917, Nicholas was asked to abdicate and name Alexis, his severely ill son, as his successor under the regency of an uncle, Grand Duke Michael. At this juncture, Nicholas refused, and the Romanov dynasty was ended.

When another granddaughter, Victoria Eugenie, married Alfonso XIII, the king of Spain, the union produced seven children: five sons and two daughters.[5] Three of the sons had hemophilia, but the carrier state of the daughters is unknown.

Great changes have occurred in the diagnosis and treatment of hemophilia since the time of Queen Victoria.[6] The untoward events resulting from these marriages could have been ameliorated or perhaps even averted. Life expectancy in patients with hemophilia in the Victorian era ranged to 30 years. Today, the availability of clotting factor preparations has increased the expected life span almost to normal.[7]

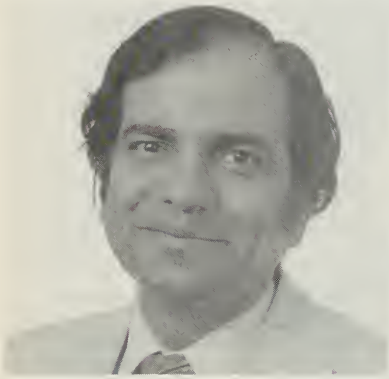
1993 Component Society Presidents

The Med Chi component societies are the backbone of the Maryland family of medicine. This section of the Maryland Medical Journal *is dedicated to the leaders of the components and features biographical information on the presidents of the component medical societies.*

Baltimore City

Thomas E. Hunt, Jr., M.D.

THOMAS E. HUNT, JR., M.D., took office in December as president of the Baltimore City Medical Society for 1993. A native of Pittsburgh, Pennsylvania, Dr. Hunt received his undergraduate degree from West Virginia University in 1950 and his medical degree from the University of Maryland in 1954, where he also served as an intern and assistant resident in general surgery. In 1959, after completing a residency at Johns Hopkins Hospital, Dr. Hunt began his private practice in Baltimore. As an active member of Med Chi, Dr. Hunt has served on the Physician/Patient Relations Committee, as an alternate to the Board of Councilors, and as a delegate to the House of Delegates. Dr. Hunt is also a member of the American Medical Association, the American Academy of Orthopaedic Surgeons, the Maryland Orthopaedic Society, in which he has served as president and secretary-treasurer, the Eastern Orthopaedic Society, the Lister Society, the Johns Hopkins Medical and Surgical Association, and the Schmeisser Society of Johns Hopkins University. He consults for Stella Maris Hospice, the Division for Crippled Children's Services of the Department of Health and Mental Hygiene, and the Johns Hopkins Hospital Limb Prosthesis Clinic. His hospital affiliations include Johns Hopkins, Mercy Medical Center, and the Children's Hospital and Center for Reconstructive Surgery. He holds the rank of assistant professor emeritus at the Johns Hopkins School of Medicine. ▼



Baltimore County

Marianne Benkert, M.D.

MARIANNE BENKERT, M.D., became president of the Baltimore County Medical Association in January 1993. A native of California, she obtained her medical degree from the St. Louis University School of Medicine in 1965. She completed a rotating internship and a one-year general surgery residency at Los Angeles County General Hospital, and a psychiatric residency at the Seton Psychiatric Institute in Baltimore. Since 1970, Dr. Benkert has had a private practice in psychiatry in Baltimore. She holds privileges at Sheppard Pratt Hospital and at St. Joseph Hospital, where she has served on the Medical Education Committee, the Utilization Review Committee, and as education program director for the Department of Psychiatry. In Med Chi, she serves as a member of Council, of the House of Delegates, and of the Committee on Women in Medicine. In the Maryland Psychiatric Association, Dr. Benkert has been a member of the Executive Council, the Legislative Committee, and the Peer Review Committee, and chairperson of the Committee on Women. Prior to becoming president of the Baltimore County Medical Association, she served on the Board of Governors, the Board of Directors, and the Membership Committee; she also held the offices of treasurer, secretary, and vice president, and served as chairperson of the Peer Review Committee and of the Budget, Finance, and Personnel Committee. Dr. Benkert is a member of the American Medical Association, the American Psychiatric Society, and the Maryland Society for Adolescent Psychiatry. She is also an instructor in psychiatry at Johns Hopkins. ▼

Calvert County

Anwar Ali T. Munshi, M.D.

ANWAR ALI T. MUNSHI, M.D., assumed the office of president of the Calvert County Medical Society in January 1993. Dr. Munshi holds degrees from Jaihind College, the University of Bombay, and Grant Medical College in Bombay, India. After completing his internship and residency at J.J. Group of Hospitals and St. George's Hospital, Grant Medical College, Dr. Munshi became house physician and registrar in internal medicine at the same institution. In 1972, he continued his training in the United States, completing an internship and residency at Mount Vernon Hospital, Mount Vernon, New York, and two additional residencies at the Hospital for Joint Diseases and Medical Center in New York. As an attending physician at Calvert Memorial Hospital, Dr. Munshi has filled the posts of chief and secretary-treasurer of the medical staff, chairperson of the Department of Medicine, and member of the Medical Executive Committee. He is also attending physician at Charlotte Hall Veterans Home, consulting physician at St. Mary's Hospital, and medical director at Calvert County Nursing Center and Solomons Nursing Center. Dr. Munshi is board certified by the American Board of Internal Medicine, and board certified in geriatric medicine. He is a member of the American College of Physicians. ▼

Caroline County

Christian E. Jensen, M.D., M.P.H.

CHRISTIAN E. JENSEN, M.D., M.P.H., has been president of the Caroline County Medical Society since 1979. Dr. Jensen graduated from Duke University Medical School and earned master's degrees from Rutgers University and the Medical College of Wisconsin. He completed an internship at the Naval Hospital in Portsmouth, Virginia, and a residency in occupational medicine at the University of Cincinnati College of Medicine. He is board certified in family practice and occupational medicine. A Naval Reserve captain, Dr. Jensen is a Desert Storm veteran. In addition to his private practice, he has been medical director of the Delmarva Foundation since 1990. As a member of Med Chi, he serves on the Occupational Medicine Committee. Dr. Jensen is also a member of the American Medical Association, the Delaware State Medical Society, and the Naval Reserve Association. He is a fellow of the American Academy of Family Practice and holds master status in the American College of Occupational Medicine. Dr. Jensen farms 500 acres in Caroline County. ▼

Cecil County

Henry Farkas, M.D., M.P.H.

HENRY FARKAS, M.D., M.P.H., began his eighth term as president of the Cecil County Medical Society in January 1993. A native of New York City, Dr. Farkas attended Loyola College and Johns Hopkins University, where he received his medical degree in 1970 and his master's degree in public health in 1971. After completing his internship at Lancaster General Hospital in Lancaster, Pennsylvania, Dr. Farkas served as general medical officer on a Navajo reservation in Chinle, Arizona. Returning to Maryland in 1973, he worked as an emergency physician at Harford Memorial Hospital and as medical director for the Cecil County Detention Center. Currently, Dr. Farkas practices emergency medicine at Union Hospital of Cecil County, where he has held the posts of president of the medical staff, chairperson of the Emergency Department, and medical director of occupational health. He also serves as medical director of the Northern Chesapeake Hospice and the Medical Adult Day Care Center of Union Hospital of Cecil County. An active member of Med Chi, Dr. Farkas serves on the Peer Review Committee. He is a member and sits on the Board of Directors of the Maryland Chapter of the American College of Emergency Physicians. ▼

Charles County

Maria Luisa Tan Gatue del Rosario, M.D.

MARIA LUISA TAN GATUE DEL ROSARIO, M.D., became president of the Charles County Medical Society on January 1, 1993. A native of Manila, where she obtained her medical degree, Dr. del Rosario came to the United States in 1964. She completed an internship at Lutheran Medical Center, Brooklyn, New York, and residencies at Francis Scott Key Medical Center, Johns Hopkins Hospital, and Lawrence Memorial Hospital in New London, Connecticut. After four years of private practice in obstetrics/gynecology in the Philippines, Dr. del Rosario returned to this country, where she became research fellow at Lincoln Memorial Hosptial, Bronx, New York, and a house physician at Holy Cross Hospital in Silver Spring, also spending one year in the United States Public Health Service in Washington, DC. Since 1971, Dr. del Rosario has had a private practice in obstetrics/gynecology in Charles County. She holds privileges at Southern Maryland Hospital Center and Physicians Memorial Hospital, where she has served as department chairperson of obstetrics/gynecology for six years. In addition to Med Chi and the American Medical Association, Dr. del Rosario holds membership in numerous professional and civic organizations, including the American Medical Women's Association, the Association of Women Surgeons, the Obstetrical and Gynecological Society of Maryland, the Southern Maryland Medical Society, the Prince George's County Women's Medical Association, the Association of Philippine Physicians in Maryland, the Philippine American Association of Metropolitan DC, the Charles County Business and Professional Women's Club, Zonta International Club of Charles County, the Charles County Chamber of Commerce, the American Cancer Society, the American Heart Association, the Charles County Association for Handicapped and Retarded Citizens, and the Charles County Children's Aid Society, Inc. Dr. del Rosario's name appears in *Who's Who of American Women*, which lists those who have by their outstanding achievement contributed to the betterment of contemporary society. ▼

Dorchester County

Joseph A. Zitarelli, M.D., F.A.C.S.

JOSEPH A. ZITARELLI, M.D., F.A.C.S., recently took office as president of the Dorchester County Medical Society. Dr. Zitarelli earned his undergraduate degree at Pennsylvania State University and his medical degree at Hahnemann University School of Medicine in Philadelphia. He completed his internship and residency at Mercy Catholic Medical Center in Darby, Pennsylvania, before entering private practice in general surgery in Secane, Pennsylvania, for one year. He began his private practice in Cambridge, Maryland, in 1989. Dr. Zitarelli has held the post of chief of surgery at Dorchester General Hospital; he currently serves on the board of directors. He is also assistant director of emergency services for Dorchester County. In addition to his membership in Med Chi, he is a member of the Southern Medical Association and a fellow of the American College of Surgeons. He is a diplomate of the American Board of Surgery. ▼

Frederick County

Henry P. Laughlin, M.D., Sc.D., Sc.S.D.

HENRY P. LAUGHLIN, M.D., SC.D., SC.S.D., began his third term as president of the Frederick County Medical Society on January 1, 1993, and is the first physician to have held the office of president in both Frederick and Montgomery counties. A native of Hagerstown, Dr. Laughlin attended Ursinus College, Johns Hopkins University, and Temple University School of Medicine, where he earned his medical degree in 1941. For the next seven years, Dr. Laughlin served as a naval physician in many parts of the world. Following World War II, he maintained a private practice in psychiatry for over 40 years in the Chevy Chase, Bethesda, and Frederick areas. As an active member of Med Chi, Dr. Laughlin is associate editor of the *Maryland Medical Journal* and editor of the *Physician's Practice Digest.* He was a faculty member at the George Washington University for 35 years, the last six with the rank of clinical professor. From 1974 to 1989, Dr. Laughlin served as distinguished visiting professor at the University of Louisville School of Medicine. The recipient of numerous awards, he has an honorary Sc.D. degree from Ursinus College and an Sc.S.D. degree from the University of Louisville. Dr. Laughlin is an emeritus staff member of Suburban Hospital in Bethesda and of Frederick Memorial Hospital. ▼

Garrett County

Margaret A. Kaiser, M.D.

MARGARET A. KAISER, M.D., became president of the Garrett County Medical Society in January 1993. A native of Oregon, she graduated with honors from Santa Clara University and obtained her medical degree from the University of Oregon Health Sciences Center in 1979. She completed an internship and residency in internal medicine and primary care at the University of Maryland Hospital and Loch Raven Veterans Hospital. From 1982 to 1985, Dr. Kaiser worked as an emergency room physician, and since 1985 has had a private practice in Oakland, Maryland. In addition to her membership in Med Chi, Dr. Kaiser holds memberships in the American College of Physicians, the Wilderness Medical Society, and the American Geriatrics Society. A former member of the Board of Directors of Garrett County Memorial Hospital, she currently serves as the chief of medicine and chief of staff at that hospital and as medical director of Hospice of Garrett County and of the Cortland Acres Nursing Home in Thomas, West Virginia. Since 1979, she has served as a volunteer physician for the Sierra Club/National Forest Service Trail Crew. She is an assistant professor in the General Medicine Division of the University of Maryland School of Medicine, where she has taught since 1986. Dr. Kaiser is a diplomate of the National Board of Medical Examiners, and is board certified in internal medicine and geriatric medicine. ▼

Harford County

Brad Matthew Cogan, M.D.

BRAD MATTHEW COGAN, M.D., assumed office as president of the Harford County Medical Society on January 1, 1993. Dr. Cogan holds degrees from Colgate University and the Boston University School of Medicine. After completing his internship and residency at the Medical University of South Carolina, Dr. Cogan became an associate professor in the Department of Radiology at the University of South Alabama in 1979. He served as assistant professor of diagnostic radiology at the University of Texas System Cancer Center from 1981 to 1984, and as chief of radiology at Harford Memorial Hospital from 1984 to 1991. Currently, he is medical director and managing partner of a private radiology group practice in Bel Air, Maryland. A diplomate of the National Board of Medical Examiners, Dr. Cogan holds memberships in the American Medical Association, the American College of Radiology, the Radiological Society of North America, and the Association of University Radiologists. He is a native of New York. ▼

Howard County

Frederick G. Bergmann, M.D.

FREDERICK G. BERGMANN, M.D., assumed the office of president of the Howard County Medical Society for the second time in January 1993, having served his first term in the mid 1980s. Dr. Bergmann holds degrees from Cornell University and the Temple University School of Medicine. After completing an internship and residency at DC General Hospital, George Washington University Service, Dr. Bergmann served in the army, receiving an honorable discharge as a major in 1973. He completed a residency in urology at the University of Maryland before entering private practice in 1976. Dr. Bergmann has privileges at the University of Maryland Hospital and Howard County General Hospital, where he is chief of urology. Dr. Bergmann holds memberships in the American Medical Association, the American Urological Society, the Maryland Urological Society, and the Southern Medical Association. He is board certified by the American Board of Urology and is a fellow of the American College of Surgeons. Dr. Bergmann is a native of New Jersey.▼

Kent County

Helen Andrews Noble, M.D.

HELEN ANDREWS NOBLE, M.D., became president of the Kent County Medical Society in January 1993. A Maryland native, Dr. Noble graduated with honors from Dartmouth College in 1978 and from the Medical College of Wisconsin in 1987. She completed her internship and residency at Washington Hospital Center in Washington, DC. In addition to her membership in Med Chi, Dr. Noble is a member of the American College of Physicians, the American Society for Internal Medicine, and the American Geriatric Society. Dr. Noble holds appointments as an active staff member, chairperson of the section of internal medicine, chairperson of the Pharmacy and Therapeutics Committee, and member of the Strategic Planning Committee at Kent and Queen Anne's Hospital, and as a member of the Advisory Board of the Kent County Home Health Association. She is a diplomate of the American Board of Internal Medicine and the National Board of Medical Examiners. Her honors include the Alpha Omega Alpha Honors Society, 1987, and the American Medical Women's Association Scholarship Achievement Citation, 1987. Dr. Noble currently has a private practice in general internal medicine.▼

Montgomery County

Donald S. Stepita, M.D.

DONALD S. STEPITA, M.D., recently became president of the Montgomery County Medical Society. A native of Gary, Indiana, he obtained his undergraduate and medical degrees at Indiana University, where he also completed an internship and residency in general surgery. After completing additional residencies at the Oschner Clinic and Baylor College of Medicine, Dr. Stepita became the assistant chief of the Plastic Surgery Service at Walter Reed Army Medical Center. In addition to his active membership in Med Chi, in which he has served on the Peer Review Management Committee, the Ad Hoc Committee on Physician Licensure, and Council, Dr. Stepita holds membership in numerous other professional organizations. These include the American Medical Association; the American Society of Plastic and Reconstructive Surgery, in which he served on the Public Education Committee, Government Relations Committee, and at the 1989 and 1991 Leadership Conferences; the National Capital Society of Plastic Surgeons, in which he has held the offices of secretary-treasurer and president, and has served on the board of directors; the Columbia Clinical Society; the Alton-Oschner Surgical Society; and the Baron Hardy Plastic Surgical Society. Prior to assuming the Montgomery County Medical Society presidency, Dr. Stepita's roles included chairperson of the Board of Professional Relations, member of the Peer Review Committee and the Inter-Professional Committee, and the vice presidency. In addition to academic appointments at Walter Reed Army Medical Center and the Uniformed Services University of the Health Sciences, Dr. Stepita has made numerous professional presentations on plastic surgery. ▼

Prince George's County

Benjamin Maldonado, M.D., Jr., F.A.C.S., F.I.C.S

BENJAMIN MALDONADO, M.D., JR., F.A.C.S., F.I.C.S, became president of Prince George's County Medical Society on January 1, 1993. He obtained his medical degree from San Simon Medical School, Cochabamba, Bolivia, in 1953. He completed internships at San Simon University Hospital and Prince George's General Hospital and residencies at Glendale Hospital in Glendale, Maryland, Prince George's General Hospital, and Children's Hospital in Washington, DC. For 25 years, Dr. Maldonado has had a private practice in general surgery in Maryland and Washington, DC. He holds privileges at Prince George's General Hospital; Prince George's Doctors' Hospital, where he has served as chief of surgery, chief of staff, and chief of general surgery; Children's Hospital; Washington Sanitarium; and Southern Maryland Hospital Center. He has held teaching posts at San Simon University Hospital and with the Southern Maryland Heart Association. Dr. Maldonado is a fellow of the International College of Surgeons, the American College of Surgeons, the International Academy of Proctology, the Southeastern Surgical Association, the Pan American Medical Association, and the American Academy of Abdominal Surgeons; he is an associate in the Pan Pacific Surgical Association. In addition to Med Chi, he holds memberships in the DC Medical Society and the Washington Academy of Surgeons. He has served on the Board of Claims Commission of Med Mutual and on the Malpractice Committee and Peer Review Committee (chairperson 1987–1990) of the Prince George's County Medical Society. ▼

Queen Anne's County

John R. Smith, M.D.

JOHN R. SMITH, M.D., began his sixth term as president of the Queen Anne's County Medical Society in January 1993. Dr. Smith graduated from the University of Maryland School of Medicine and completed an internship and one year of residency at Union Memorial Hospital in Baltimore, another year of residency at the Hospital for Women of Maryland, and a fellowship in internal medicine at Johns Hopkins Hospital. In 1951, Dr. Smith entered the United States Air Force; with the rank of captain, he served as chief of medicine at the Mitchell Air Force Base in Garden City, Long Island, New York. Dr. Smith maintained a private practice in New York City between 1954 and 1960. During that time, he was an instructor in medicine at Cornell Medical School and an attending physician at the New York Hospital for Cornell medical school. Since 1960, Dr. Smith has practiced internal medicine in Centreville, Maryland. ▼

Talbot County

David A. Stout, M.D.

DAVID A. STOUT, M.D., began his second term as president of the Talbot County Medical Society in July 1992. Dr. Stout graduated from Loma Linda University Medical School, Loma Linda, California. He completed his internship and residency in pathology at the Yale–New Haven Hospital in Hew Haven, Connecticut. After two years as a surgeon for the Public Health Service, Dr. Stout began a two-year residency in clinical pathology at the National Institutes for Health in Bethesda. He served as attending pathologist at Kent and Queen Anne's Hospital and at LeLand Memorial Hospital from 1970 to 1975. Currently, Dr. Stout is an attending pathologist at Memorial Hospital in Easton. ▼

Washington County

Edward W. Lampton, Jr., M.D.

EDWARD W. LAMPTON, JR., M.D., recently took office as president of the Washington County Medical Society. A native of West Virginia, Dr. Lampton graduated from West Virginia University and the University of Maryland School of Medicine, where he was a member of the Alpha Omega Alpha Honorary Fraternity. He completed his internship at the University of Pittsburgh Children's Hospital and his residency training at the University of Maryland Hospital in diagnostic radiology. Dr. Lampton is an active member of Med Chi, serving on the Legislative Committee; the American Medical Association; the American College of Radiology, in which he is a member of the Government Relations Committee of General and Pediatric Radiology; the Radiological Society of North America; the American Institute of Ultrasound in Medicine; the Society of Breast Imaging; the Society of Ultrasound in Medicine; and the board of the Maryland Radiological Society, of which he is legislative chairperson. Currently, Dr. Lampton, who is board certified in radiology, is a staff radiologist for Associated Radiologists, P.A., in Hagerstown. ▼

Wicomico County

Gabriel John Somori, M.D.

GABRIEL JOHN SOMORI, M.D., assumed office as president of the Wicomico County Medical Society on January 1, 1993. Dr. Somori holds degrees from George Washington University, Virginia Commonwealth University, and the Medical College of Virginia. After completing his internship and residency at the Medical College of Virginia, Dr. Somori became a staff anesthesiologist at Peninsula General Hospital Medical Center in Salisbury. He served as chief of the anesthesiology department from 1987 to 1989, and as director of operating room scheduling from 1989 to the present. He also served as president of a nine-physician group practice from 1990 to 1992. A diplomate of the American Board of Anesthesiology, Dr. Somori holds memberships in the American Society of Anesthesiologists and the Maryland-DC Society of Anesthesiologists, in which he serves on the Legislative Committee. The honors he has received include Phi Kappa Phi Academic Achievement, the H. Hertzberg Award, the Upjohn Pharmaceuticals Achievement Award, and the A.D. Williams Summer Research Fellowship. Dr. Somori was born in Budapest, Hungary, and became an American citizen in 1964. ▼

Worcester County

Steven F. Waters, M.D.

STEVEN F. WATERS, M.D., entered his fourth term as president of the Worcester County Medical Society in January 1993. Dr. Waters holds degrees from Catholic University with honors, and from the Georgetown University School of Medicine. After completing a family practice residency at Franklin Square Hospital in Baltimore in 1983, Dr. Waters began his private practice in family and ambulatory medicine in Ocean City. A diplomate of the National Board of Medical Examiners, Dr. Waters holds memberships in the American Medical Association, the American Academy of Family Practice, and the Maryland Academy of Family Practice. Dr. Waters is a native of Pennsylvania. ▼

Resident Component Society

Michael Armstrong, Jr., M.D.

MICHAEL ARMSTONG, JR., M.D., 1993 president of the Resident Component Society, grew up in Richmond, Virginia. He graduated with honors from Princeton University and received his medical degree from Duke University Medical School in 1989. He has since completed an internship in general surgery and is currently an otolaryngology—head and neck surgery resident at Johns Hopkins Hospital. In addition to memberships in Med Chi and the American Medical Association, Dr. Armstrong's professional memberships include the American Academy of Otolaryngology—Head and Neck Surgery, the American Academy of Facial Plastic and Reconstrutive Surgery, and Sigma Xi Scientific Research Society. His honors and awards include Alpha Omega Alpha, a Duke Eye Center Research Scholarship, an Edward H. Benenson Merit Scholarship, and Phi Beta Kappa. ▼

Med Chi would also like to recognize those component society presidents whose biographical information was not available at press time:

- Allegany County
  Clarence Vincent, M.D.
- Anne Arundel County
  Daniel McCabe, M.D.
- Carroll County
  James Forsberg, M.D.
- Somerset County
  James A. Sterling, M.D.
- Student Component Society
  Al Dhanji

Computerized information sources: A medical sampler

As part of the Med Chi Library's ongoing efforts to bring important medical information sources to Faculty members' attention, this month's "From the Med Chi Collections" discusses three examples of the depth and breadth of medical information sources available to physicians via the personal computer (IBM-compatible or Macintosh). Using Medline as a point of comparison, this discussion provides an introduction to

- Genetic databases that offer rich, practical (and free) resources for a wide variety of clinicians—*The Genome Data Base* and *Online Mendelian Inheritance in Man*;
- A consumer health database patients may access at home or the public library that provides valuable information not available through Medline—*Health Database Plus*; and
- A "super highway" for accessing databases throughout the world—*The Internet*.

Some preliminaries. If you have not yet bought a computer, prices are now so low that cost is an increasingly flimsy excuse. For $1,000 or less, you can purchase a computer, modem, and software that will allow access to the sources described in this discussion, and more.

Once you have the hardware, you will also need a telecommunications software program, which will probably come with the computer if you ask. Depending on the databases you want to access, you will need to join an information service such as CompuServe, unless you already have access to such a gateway through an institutional affiliation.

The Genome Data Base

Maintained at the Johns Hopkins University School of Medicine, the Genome Data Base (GDB), which is available free, apart from telephone charges, contains information on genetic loci, polymorphisms, probes, and contacts, as well as references to journals, books, theses, and personal communications. One hundred editors compile the information in GDB, which is updated continuously, from the literature, other databases, human genome mapping workshops, chromosome-specific workshops, national laboratories, GDB editors themselves, and, in the future, from direct author submission. Much of the information is unavailable in any other source. Extensive reference, training, and user information is available free of charge. To obtain a password and additional information about accessing this database, call the user support number, 410-955-7058.

Online Mendelian Inheritance in Man

The Online Mendelian Inheritance in Man (OMIM) database, which is also maintained at the Johns Hopkins School of Medicine, is the full-text online version of Dr. Victor A. McKusick's *Mendelian Inheritance in Man*. OMIM is a catalog of human genes and genetic disorders. Family practitioners, internists, pediatricians, obstetricians, gynecologists, and others will find this an invaluable source for up-to-the-minute clinical information on genetic disease and disorders. It can be searched by itself or in conjunction with GDB. This knowledge base is updated daily and is free accept for telephone charges. Reference, training, and user information, as well as password and accessing information are available through the user support number—410-955-7058.

Strengths

- Unlike Medline, health professionals can use OMIM to obtain clinical synopses of covered disorders.
- Also unlike Medline, signs and symptoms can be used as search terms to locate information.
- Again, unlike the limited journal article abstracts provided through Medline, large parts of retrieved entries are frequently extensive discussions of clinical characteristics, including bibliographies.

Limitations

- OMIM is limited to single gene, Mendelian disorders. In other words, searching for "Down's syndrome" would yield information only where the information was related to single gene disorders.
- To this searcher, the search engine (e.g., the software used to search the database) is clumsy. As with any software, however, familiarity breeds ease of use.

Summary

- Whether or not they are gifted geneticists, clinicians looking for an inexpensive, up-to-date source of information on genetic disorders will find this database useful.

Health Database Plus

Health Database Plus (HDB) is a product of the Information Access Company, which also produces Infotrac™ (you may have seen Infotrac workstations in public and college libraries) and the Health Reference

Center™ (the Wheaton Public Library Health Information Center and the Health Sciences Center Library at the University of Virginia use the Health Reference Center).

HDB indexes 80+ nonprofessional journals (e.g., *Alcoholism and Drug Abuse Week*, *Cancer News*, *Harvard Medical School Health Letter*) and 80 or so professional journals (e.g., *American Family Physician*, *CA: A Cancer Journal for Clinicians*, *JAMA*, *Lancet*, *New England Journal of Medicine*). In addition to the author's abstract, the citations for the latter group of journals include a synopsis for the lay reader. Health Database Plus also allows full-text retrieval of most cited articles.

Access to HDB is available through CompuServe, an information and communication service. Costs for CompuServe and HDB are low—CompuServe basic service is $8.95/month; bibliographies on HDB can be generated without charge; and full article citations cost only $1.50 per article and summarized articles cost $1.00.

Strengths

- HDB is inexpensive and easy to use. Lay persons expect health professionals to be aware of everything lay persons know, whether or not the information has any established clinical validity. About 10% of the searches I perform for physicians deal with consumer health issues (e.g., risks to pregnant women from electric blankets). HDB provides health professionals easy, quick, economical access to consumer health information.
- HDB provides access to information not in Medline. For example, a search in the current (1989–1993) Medline file for cryosurgery in prostatic neoplasms yielded the following three English-language citations:
  - Onik G. et al. Percutaneous transperineal prostate cryosurgery using transrectal ultrasound guidance: animal model. *Urology*. 37(3):277–81, 1991 Mar.
  - Pontes JE. Salvage prostatectomy. *Progress in Clinical & Biological Research*. 303:307–13, 1989.
  - Fontana G. et al. Immunological response to prostatic cancer cryotherapy: certainties, controversies, hypotheses. *Progress in Clinical & Biological Research*. 303:299–300, 1989.

  Searching cryosurgery in HDB, however, yielded the following citations not found in Medline—all of which are more recent than those in Medline. Moreover, the full text of the articles can be called up on the spot and read or printed off:
  - "Freezing" prostate could eliminate cancer surgery. (Rush-Presbyterian-St. Luke's Medical Center), *Cancer Weekly*, March 1, 1993. p7(2). Reference # A13468978. Text: Yes (897 chars). Abstract: No.
  - New method to treat prostate cancer shows promise. (percutaneous ultrasound-guided prostate cryosurgery) (Allegheny General Hospital, Pittsburgh, Pennsylvania), *Cancer Weekly*, Dec 14, 1992. p7(2). Reference # A13039513. Text: Yes (4724 chars). Abstract: No.
  - Chilling prostate cancer. (cryosurgery) (includes related article on free screening), *U.S. News & World Report*, Oct 12, 1992. v113. n14. p84(2). Reference # A12706827. Text: Yes (7208 chars). Abstract: Yes.
  - AccuProbe is used successfully in prostate surgery. (cryosurgery system by Cryomedical Sciences Inc.) (M.D. Anderson Medical Center), *Cancer Weekly*, August 24, 1992. p6(1). Reference # A12558693. Text: Yes (1859 chars). Abstract: No.
- Searching on HDB is easy and free (apart from CompuServe connect charges), until you start pulling up the full-text or abstracts of articles cited.

Limitations

- HDB only goes back to 1989, includes nonrefereed journals and news type publications, and has only limited controlled-language searching capabilities and documentation

Summary

- Health care professionals wishing lay-oriented sources of information can access HDB easily and inexpensively, while potentially finding sources of information not available through Medline. The moderately priced full-text capability is quite useful, although it only applies to journals indexed by HDB.

The Internet

The Internet is not a distinct database, but a network of computer networks throughout the world. Designed originally by the US Department of Defense as a way to provide researchers with access to supercomputers, the Internet eventually assumed a life of its own. Most health care professionals in academic institutions and large government agencies probably know of the Internet's existence. Access, however, is quickly filtering down to the individual level, while the costs of such access are falling as well.

The Internet offers three basic functions:

1. *Access to worldwide information*

in electronic form. For example, one can access college library catalogs throughout the world, along with commercial databases that academic institutions may provide local users; and government cosponsored databases, such as PENpages, which provides agricultural and nutritional information produced by Pennsylvania State University with support from the US Department of Agriculture.

2. *File Transfer.* Internet users with file transfer protocol (FTP) capabilities can transfer software programs, graphic images, and other non-ASCII text files directly to their computers. This capability allows the user to obtain copies of electronic journals, directories, catalogs, and bibliographies. Due to the way in which these files are transferred (that is, as chunks of information rather than line by line), speeds for such transfers are lightning fast, even when using a relatively slow modem.
3. *E-Mail.* Handy though the facsimile machine may be, it is noninteractive—recipients cannot update the information received online or add it online to the text of something being prepared for publication. Facsimile machines also lack the ability to serve as a meeting point for persons with common interests. E-mail and computer bulletin boards can serve this purpose. For example, after accessing the PENpages database, a user could send an E-mail message to the PENpages system manager asking specific questions regarding PENpages content, and then check for the existence of a nutrition bulletin board in order to share ideas or obtain information from other nutritionists. Although gateways such as CompuServe have offered these capabilities for a long time, the Internet is expanding the scope by many powers of ten.

Access. There are a large number of organizations offering access to the Internet as it is not run by a single entity. Consequently, users who have a university or government affiliation should ask if it is possible to obtain an account through the organization. A large number of associations and commercial organizations also have accounts with the Internet, and members or employees may be able to obtain access through them. If all else fails, a number of communication companies offer access on a wide variety of fee bases. References to books providing information about these sources are listed below.

Summary. Efforts have long been under way to allow global linkage and access to the huge information sources existing in electronic form. The Internet is making tremendous strides toward achieving this goal.

For further information

General online searching information

- A *Basic Guide to Online Information Systems for Health Care Professionals* by Ronald G. Albright, M.D., was published in 1988 by Information Resource Press of Arlington, Virginia. It is somewhat outdated, but still provides useful introductions to the main online information sources (e.g., The National Library of Medicine/Grateful Med, CompuServe, BRS, and DIALOG).
- "Turn Your Computer into a Medical Library" by Suzanne Duke, appeared in *Medical Economics* in March 22, 1993 (70(6):231–5). It is a brief summary of databases, information exchange forums, and bulletin boards for physicians, and of gateways such as CompuServe.
- *Information Searching in Health Care* by Renee M. William et al, published in 1992 by Slack Inc. of Thorofare, New Jersey, is an introductory text written for health care professionals, with specific reference to information applications in the clinical setting.

The Internet

- *Library Resources on the Internet: Strategies for Selection and Use*, edited by Laine Farley, was published in 1992 by the American Library Association. It is a brief introduction to the subject indicated by the title.
- *The Whole Internet: User's Guide and Catalog* written by Ed Kroll and published in 1992 by O'Reilly & Associates, Inc. of Sebastapol, California, is an excellent source of general information on the Internet that also contains instructions for using the Internet once a user is connected. The book also contains a section discussing ways in which access can be obtained.

The experience of a nationwide laboratory.

Wouldn't it be great if you could enjoy all the advantages of a nationally—accredited testing laboratory—right here in your own neighborhood? Well, now you can.

- The nation's largest full-service clinical laboratory network
- Over 25 years experience in laboratory toxicology
- Accredited by the College of American Pathologists (CAP)
- Licensed by the U.S. Department of Health and Human Services
- Local courier network works on your schedule around the clock
- 24-hour turnaround time on most routine tests
- Extensive internal quality control program ensures the accuracy you need to prescribe proper treatment for your patients
- A commitment to serve and serve well

WORD ROUNDS

Bart Gershen, M.D.

Booze, bloodshed, and bounty

In the Middle Ages, it was customary for a noble to present his wife with an extravagant gift on the morning after their wedding. In German this was known as a *morgangabe* 'a morning gift'. If the bride was a commoner or from royalty far below her husband's standing in the aristocratic community, it was understood that this gift was all she could expect from her husband. Neither she—nor any of their offspring—would ever be permitted to accede to his rank nor share in his royal legacy.

In Latin, the marriage was known as *matrimonium ad morganaticum* 'marriage based on the morning gift'. Today, it is more plainly known as a **morganatic** marriage (See "Vignette of medical history: Queen Victoria and hemophilia," page 581).

As if to emphasize the inequality between the couple, the groom offered his **left hand** to the bride during their marriage vows. Such unions were often contemptuously referred to as "left-handed marriages," which ultimately spawned the expression: "**a left-handed compliment**" (that is, an insult cloaked in thinly veiled flattery).

In the early years of the 20th century, such a morganatic marriage occurred between Archduke Francis Ferdinand—heir to the throne of Austria-Hungary—and Sophie Chotek, a mere countess. Their union would have been but a trivial footnote to European history, and of absolutely no consequence to the rest of the world, were it not for two minutes on the afternoon of June 28, 1914.

Over the preceding 18 months, the Balkan League, comprising Serbia, Bulgaria, Albania, and Greece, had defeated the Turkish Ottoman Empire. Following their success, however, the victors began to quarrel among themselves. Soon a bloody Balkan war began. Reports of atrocities between Bulgarians and Serbs were commonplace. The Russians, who had intimate connections to the Serbians, attempted, unsuccessfully, to mediate. The Austro-Hungarians were busily annexing unprotected Balkan territory.

Finally, Great Britain negotiated an armistice agreement, but it was an uneasy truce. It was at this fragile moment that the Archduke Ferdinand and his wife chose to make a state visit to Sarajevo.

Their parade route led them directly past a café called *Zeata Moruna*, the "Green Garland." Inside the café, sipping coffee, was a 19-year-old Serbian high-school student named Gavrilo Princip. A few weeks before, Princip and several of his friends had been led to a shadowy room, to a table on which was placed a skull, a gun, a bomb, and a vial of cyanide poison. There they took the oath of the Black Hand—a brutal terrorist organization led by Colonel Dragutin Dimitrijevic:

> By the sun which warms me, by the earth which feeds me, by God, by the blood of my ancestors, by my honor and by my life, I swear fidelity to the cause of Serbian nationalism, and to sacrifice my life for it.

The archduke and his wife were sitting in an open *Graf und Stift* automobile. Princip calmly approached the vehicle and fired seven shots at the occupants. The

archduke was hit in the neck and died almost instantly. Sophie, shot in the abdomen, died on the way to a hospital.

One month later, Austria-Hungary declared war on Serbia. Shortly thereafter, Russia invaded Germany, and Germany declared war on Russia and France. World War One had started.

Four years later 20 million people were dead.

Eighty years later—*deja vu*.

War, of course, is a state to which no one admits allegiance. On the other hand, it appears to be an essential human nutrient, since humankind seems incapable of existence without it.

Count the wars we list among our cherished memorabilia:

- ❑ The Assyrian War
- ❑ The Boer War
- ❑ The Babylonian War
- ❑ The Crimean War
- ❑ The Hittite War
- ❑ The Napoleonic Wars
- ❑ The Trojan War
- ❑ The War of the Roses
- ❑ The Messenian Wars
- ❑ The Spanish-American War
- ❑ The Ionian War
- ❑ The Mexican-American War
- ❑ The Peloponnesian War
- ❑ The French and Indian War
- ❑ The Alexandrian Wars
- ❑ The Russo-Japanese War
- ❑ The Punic Wars
- ❑ The Sino-Japanese War

The Arab-Israeli, Iran-Iraq, Italo-Ethiopian, Korean, Vietnam, and Persian Gulf conflicts, and World War I and II. And let's not forget the Seven Years', Thirty Years', and Hundred Years' wars. Nor should we slight the various civil wars such as the English, Chinese, Spanish, Mexican, Russian, French, Rhodesian, and American—and this is only a partial listing of the slaughter, bloodshed, and carnage for which all nations erect memorials.

I have not included the more trivial military campaigns that have inspired patriots and mesmerized throngs of faithful posterity. For example, there was the curious incident that occurred on board the British ship *Rebecca* in 1731.

Her captain was Robert Jenkins, and he had anchored for provisions in the harbor of Havana. Suddenly, the ship was boarded by the Spanish Coast Guard. There was a brief, furious fight, but the Spaniards were too many and too well armed. They captured the vessel and her crew and promptly expropriated the cargo.

Then Fandino, the Spanish captain, severed Robert Jenkins' right ear from his head—and handed it to him! Eight years later, with his desiccated ear wrapped securely in a leather pouch, Robert Jenkins stood before a hushed Parliament and told his story. England promptly declared war on Spain. The war was variously known as **King George's War** or **The War of Austrian Succession**. But most historians remember it as **The War of Jenkins' Ear**.

The first priority for England was to appoint a commander who could incisively direct strategic operations at this vast distance from London. England chose an irascible, ex-member of Parliament named **Admiral Edward Vernon**.

Vernon had an eccentric habit that prompted his famous nickname. While on deck—no matter what the weather—he always wore a long coat made of thick, coarse material that the French called *gros grain*—but the British called **grogram**.

He wore the coat in heavy gales, and in snowstorms, sleet, and hail. He also wore it at the height of the Caribbean summer. So the men, referring to the coat, nicknamed their captain **"Old Grog."**

Vernon had another idiosyncrasy, not quite as charming to the men under his command. In addition to his cantankerousness, he was downright stingy. This was evidenced by the parsimonious manner in which he distributed goods and services to the ranks. Nowhere was this more conspicuous than during the traditional happy hour, which was observed on Fridays aboard each vessel of his majesty's fleet. Rum was the customary beverage and was carefully stored along with the food, weapons, gunpowder, and other provisions.

Old Grog was not thrilled with the prospect of weekly drunken brawls on board his ship. Nor was he especially pleased at having to pay the price for rum—which came out of his budgetary allotment for supplies. So he ordered his quartermaster to cut the rum with water—a ratio of one part water to three parts rum. The men were infuriated, but could do nothing but grouse and grumble—and rename the liquid refreshment after its author.

They called it **grog**. The name has stuck to this day. In fact, after several pints of this libation one often became **groggy**—a testimony to the resilience and innovativeness of the English language. And a durable monument to an obscure despot and his coat.

But Old Grog is remembered for more than this lexical contribution. There was still the War of Jenkins' Ear to resolve. In 1739, Old Grog captured the Spanish town of Portobelo with but six ships and a small army. That achievement obliged Prime Minister Walpole to outfit an additional 100 ships and place them under Grog's authority. This fleet, transporting 27,000 men, sailed into the Spanish harbor of Cartagena in 1741. They

stormed the fort of San Felipe, but were driven back. Multiple assaults were executed during the ensuing two months. All failed.

Finally, Old Grog and his men retreated. In England, the brief glory following Portobelo diminished quickly, eclipsed by his later deplorable failure—and the crusty old curmudgeon faded into oblivion.

However, there was one interesting sidebar to this rather obscure and unimportant piece of history. During the battle at San Felipe, Old Grog formally decorated a colonial captain for exceptional heroism. His name was Lawrence Washington of Virginia, and he was half brother to nine-year-old George Washington.

Shortly after the war, Lawrence Washington left the colonial service and retired to his recently inherited plantation, which was known as Little Hunting Creek Estate. Immediately he changed the name. In honor of his former commander Old Grog, he called it **Mount Vernon**.

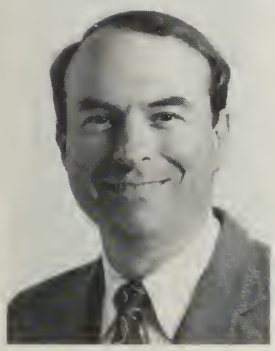
Edward Vernon had just moved from obscurity to perpetuity. ■

Med Chi Bicentennial Celebrations

Med Chi has already begun planning celebration activities for its bicentennial in 1999. If you have ideas or suggestions, please call Margaret Burri or Vivian Smith at 410-539-0872 or 1-800-492-1056.

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.



The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families. The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (410)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (410)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"

Members in the News

WILLIAM A. BAUMGARTNER, M.D., has been appointed chief of cardiac surgery at the Johns Hopkins Hospital. Director of the Hopkins Heart and Heart-Lung Transplant Program since 1983, Dr. Baumgartner is known internationally as a vital part of the team that performed the first "domino donor" and heart-lung transplants at Hopkins. A professor of surgery, he received his undergraduate degree from Xavier University, his medical degree from the University of Kentucky, and served his internship and several residencies at the Stanford University Medical Center. A prolific author, he is on the editorial board of the *Journal of Heart and Lung Transplantation* and the *Journal of Thoracic and Cardiovascular Surgery.* Dr. Baumgartner is past president of the American Heart Association—Maryland Affiliate, and is active in numerous other professional associations.

BAYANI B. ELMA, M.D., has been appointed by Governor William Donald Schaefer to the Maryland Commission on Asian Pacific American Affairs. He is currently a member of the Board of Directors of Maryland General Hospital, Inc. and was past vice-chief of staff. Dr. Elma received his bachelor's degree from the University of the Philippines and his medical degree from the University of the East College of Medicine in the Philippines. He completed a rotating internship at Nazareth Hospital in Philadelphia, Pennsylvania, and a residency in internal medicine at Maryland General Hospital in Baltimore. He is currently the president of the University of the East Medical Alumni Association of America, Inc. and is past editor-in-chief of the *Alumni Newsletter.* Dr. Elma has served as a member and officer of many professional associations, in addition to serving on numerous editorial boards; he is currently on the editorial board of the *Maryland Medical Journal.* He has written articles that have been published in several publications including the *Baltimore Sun.*

STEPHEN EPSTEIN, M.D., was elected chairperson of the National Advisory Board of the National Institute on Deafness and Other Communication Disorders (NIDCD). Dr. Epstein is an otologist who is certified by the American Board of Otolaryngology, and is a fellow of the American Academy of Otolaryngology—Head and Neck Surgery and of the American College of Surgeons. Director of the Ear Center in Wheaton, Maryland, he specializes in the diagnosis and management of ear and hearing disorders in children. Dr. Epstein is associate clinical professor of otolaryngology at George Washington University School of Medicine and clinical assistant professor of otolaryngology at Georgetown University School of Medicine. Chairperson of the NIDCD Advisory Board, he is also a member of the Advocacy Committee for Early Identification of Hearing Loss, the Joint Committee on Infant Hearing, and the Maryland Advisory Council for Hearing Impaired Infants, which administers the mandated newborn hearing screening program in Maryland.

PERRY HOOKMAN, M.D., was recently awarded the Lamplighter Award, the highest honor granted by the Lubavich Jewish Religious Movement, for his ecumenical and humanitarian activities. Dr. Hookman is currently in private practice in gastroenterology and is a consultant for the Delmarva Professional Review Organization (PRO) Utilization Review. He received his undergraduate degree from the New York University and his medical degree from the State University of New York (Downstate Medical Center). Dr. Hookman completed an internship in medicine at Kings County Hospital, New York, and an assistant residency in medicine at the Johns Hopkins Hospital, Baltimore. An avid writer, Dr. Hookman is an active member of Med Chi and the Prince George's County Medical Society, and is on the editorial board of *Montgomery Medicine,* the official journal of the Montgomery County Medical Society.

KATHY L. LAMPL, M.D., was recently recognized by the American Academy of Allergy and Immunology and the Training Program Director's Committee for five years of service as a volunteer clinical faculty member in the training of allergy/immunology fellows at Johns Hopkins and the Children's National Medical Center in Washington, DC. Associate director of the Asthma Institute, Dr. Lampl has a private practice in adult and pediatric allergy in Montgomery County. She is an instructor at the Johns Hopkins University School of Medicine and an active member of the Montgomery County Medical Society; she founded the Young Physicians Committee in 1989. She received her undergraduate degree from Brandeis University in Waltham, Massachusetts, and her medical degree from the University of Pennsylvania School of Medicine. She completed her residency in 1982 at St. Lukes Medical Center in Chicago, Illinois, and was a fellow in the Division of Clinical Immunology at Johns Hopkins from 1979–1982.

DANIEL T. MCCRONE, M.D., was promoted to corporate medical director of Blue Cross and Blue Shield of Maryland on May 1, 1993, following the retirement of Arthur T. Keefe, Jr., M.D. Since 1989, Dr. McCrone had served as president and chief operating officer of Maryland Medical Services, Inc., a division of Blue Cross and Blue Shield of Maryland that provides utilization review, professional relations, and medical policy services. A graduate of the University of Cincinnati, Dr. McCrone completed his medical degree at Ohio State University College. He is a member of the Baltimore County Medical Association and has served on the Med Chi Specialty Credentialing Committee. He resides with his family in Baldwin, Maryland.

JOHN A. SINGER, M.D., has been appointed Maryland chairperson of the American College of Surgeons' Cancer Liaison Program, a part of the Commission on Cancer of the American College of Surgeons. In this capacity, he will help select and guide area cancer liaison physicians in the implementation of local cancer programs designed to improve patient care. Dr. Singer is currently the director of surgical education at St. Agnes Hospital in Baltimore and an instructor in surgery at the Johns Hopkins School of Medicine. He received a bachelor's degree in psychology from Cornell University and his medical training from the State University of New York in Brooklyn. He completed an internship at Kings County Hospital in New York and residencies at Tufts New England Medical Center, Boston, Massachusetts, and the University of Maryland Hospital, Baltimore.

WAYNE SPIGGLE, M.D., was elected to the Alpha Omega Alpha Honor Medical Society, the aim of which is to promote scholarship and research in medical schools. Dr. Spiggle, a preceptor since 1977 in the Western Maryland Area Health Education Center (AHEC) program, was selected from among 100 health care professionals who serve as preceptors in western Maryland because of his encouragement of a high standard of character and conduct among medical students and graduates. Dr. Spiggle, an internist with the Braddock Medical Group, is a clinical assistant professor of medicine at the University of Maryland School of Medicine. Dr. Spiggle received the A.H. Robins Award for Community Service in 1990 and a citation from his local Rotary Club in May 1993 for raising the most funds over the last two years for Rotary Radio Day. He was instrumental in establishing Allegany Health Right, which provides medicine to people who cannot afford medication, and has been an eloquent spokesperson for responsible waste disposal.

RICHARD M. SUSEL, M.D., was elected chairperson of the federally mandated Drug Use Review Board for the State of Maryland. Dr. Susel is an instructor at the Johns Hopkins Hospital and clinical assistant professor of ophthalmology at the University of Maryland School of Medicine. He also serves as chairperson of the Quality Assurance Committee of St. Agnes Hospital in Baltimore. Dr. Susel received his bachelor's degree from the University of Maryland and his medical degree from the University of Maryland School of Medicine. He completed his internship and residency in ophthalmology at the U.S. Public Health Service Hospital in Baltimore. He is board certified in ophthalmology and a fellow of the American College of Surgeons.

STANLEY I. WOLF, M.D., has been recognized by the American Academy of Allergy and Immunology and the Training Program Director's Committee for 40 years of service as a volunteer clinical faculty member in the training of allergy/immunology fellows at Johns Hopkins and the Children's National Medical Center in Washington, DC. Winner of the 1964 Montgomery County Medical Society Physician of the Year Award, Dr. Wolf has a private practice in adult and pediatric allergy. He received his undergraduate degree from Georgetown University and his medical degree from the Georgetown medical school. Dr. Wolf completed his internship at the University of Pittsburgh Medical Center, and a residency in pediatrics and a fellowship in allergy and immunology at the Children's National Medical Center in Washington, DC. Founder of the National Children's Center, he is also past president of the Greater Washington Allergy Society and the Montgomery–Prince George's Pediatric Society.

Erratum: *In the April "Members in the News," the photographs of Dr. Keller and Dr. Garguilo were transposed. MMJ regrets the error.*

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/ Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

To volunteer or for more details, call Med Chi's Public Relations Department at 410-539-0872 1-800-492-1056.

Doctor/Lawyer/Teacher Partnership Against Drugs

In Memoriam

Melvin F. Polek, M.D.

MELVIN F. POLEK, M.D., a retired physician who had been on the staff of Mercy Hospital in Baltimore, died May 20, 1993, following a car accident near his home. Born in Baltimore, he was a graduate of Loyola College and the University of Maryland School of Medicine. Early in his career, he was a staff doctor at the House of Correction, and during World War II, he served in Europe in the Army Medical Corps. A member of the Baltimore City Medical Society, Dr. Polek had maintained a general practice for 35 years in northeast Baltimore.

William A. Rinn, M.D.

WILLIAM A. RINN, M.D., 79, died suddenly of heart failure on June 5, 1993. A native of Baltimore, Dr. Rinn was a graduate of the Catholic University of America and the Georgetown University School of Medicine. The 1984 recipient of Georgetown's John Carroll Award, Dr. Rinn was a life fellow of the American Psychiatric Association and a member of the Baltimore County Medical Association. He had been director of psychiatric services at Bon Secours Hospital from 1965 until 1979, and at Catholic Charities from 1952 until 1982. He appeared on a series of WBAL-TV programs on religion and psychiatry, and was a consultant to the Marriage Tribunal of the Archdiocese of Baltimore in the 1970s. He was a lecturer at the Catholic University of America nursing school and at the Seton Institute, where he served on the staff from 1964 to 1969. He was also a staff psychiatrist at the Baltimore County Detention Center. Dr. Rinn retired from private practice eight years ago.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA poised to respond to reform plan

The AMA is prepared to respond and communicate to the public, Congress and physicians once Clinton unveils his health system reform package.

AMA leaders will give Association members and patients immediate feedback and analysis of the proposal. The feedback will help them determine if the plan meets medicine's needs.

AMA strategy includes nationwide communications to physicians through an all-physician mailing that will reach the 718,000 physicians and medical students soon after the unveiling.

Also, a broad-based communications program will be executed to give the media and public AMA reaction and views on elements of the proposal. A grassroots strategy is planned for physicians and physician leaders to communicate with Congress.

American Medical Television (on CNBC) will outline the plan's impact on physicians and give physician response.

AMA publications will also compare its elements to those in the Association's own plan, Health Access America.

AMA triumphs, HCFA consultation policy reversed

Substantial AMA efforts helped reverse HCFA policies prohibiting primary care physicians from billing for pre- and postoperative consultations.

Effective June 28, the new policy eliminates distinctions between primary care physicians and specialists. It instructs carriers to use the current CPT definition of consultation in determining payments.

A letter from AMA EVP James S. Todd, MD, to HCFA said, "This policy is wrong and must be corrected."

"Current clinical practice includes numerous circumstances in which the surgeon's request to the patient's primary care physician for a pre-operative medical clearance or history and physical constitutes a request for a consultation," Dr. Todd wrote.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Physician income poll useless, AMA says

The AMA blasted a Families United to Save America poll on physician income.

"Polls like these are devoid of useful information. It's simply scapegoating," said Thomas R. Reardon, MD, AMA trustee.

The AMA provides these helpful points to raise when asked about physician income. According to AMA data:

- Society determines the relative values of an individual's — or a profession's — contribution.
- The average physician works 60 hours a week, one-half more time than the average American's 40-hour work week.
- Physicians undergo up to 12 or more years of intense medical education, and more often do not enter practice until their early or mid-30s.
- The average medical graduate starts practice $50,000 to $100,000 in debt for that education.

"Physicians are not the engines of health care costs. Lifestyle, technology, patient demand and professional liability are key factors driving up health care costs," said Dr. Reardon.

AMA criticizes Medicare cuts

Testifying before three different congressional committees, AMA Trustee Jerald R. Schenken, MD, criticized many of the President's proposals to cut federal spending on Medicare and Medicaid programs.

The AMA urged caution, saying, "These propoals will be part of a profound series of changes that will alter forever how health care is practiced in America."

AMA Board Trustee Jerald Schenken, MD, continued, "The AMA will continue to oppose proposals that will harm our patients and splinter the medical profession. Proposals such as the RAP-DRG roll-in, the establishment of Medicaid formularies, the evisceration of the RBRVS through arbitrary reductions in the practice component and modifications of the default formula, and setting a single fee for surgical services (regardless of the value provided by an assistant surgeon) are clear examples of where medicine is united."

As an alternative, Dr. Schenken noted that "a six-month delay in all Part B updates would provide significant 1994 savings and not disrupt the achievements of RBRVS physician payment reform. This may have potentially serious consequences for many rural and inner city physicians who are barely making a go of their practices."

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

WELCOME!

The Medical and Chirurgical Faculty of Maryland welcomes the new members listed below. They join an organization with a 194-year history of dedicated service to improving the health and welfare of the people of Maryland. With the help and expertise of longtime members and the participation and input of new members, Med Chi can continue its proud tradition of ensuring quality health care.

A GREAT WAY TO SERVE

Another Kind of Investment. It's Boring!

ZZZZZZZZZ

With this investment, you get no black tie...no sip of Dom...no rush of watching dice bound over the green felt. So, if the thrill of the gamble drives your investing, we can't dance. Our investment is boring. For us there are no administrative costs and no sales commissions. But for our investors, there are no anxious moments. For our investors, the average annual yield over the past five years has exceeded 10%. But their investment is nap-inducing. Our investors watch the mailbox (rather than the agate print in The Wall Street Journal) to measure their gains, because each of them receives a monthly check. But they yawn all the way to the bank. You see, with a 1% risk factor in this investment, the gamble simply isn't there. That's why we never get to dance with the high rollers who love the epinephrine flow that comes with the gamble. For more information about this ho-hum investment, call toll free: **800/876-6784.**

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872 or 1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects),*

Information for AUTHORS

membership and legislative news, continuing medical education notices, and programs and policies of the faculty.

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

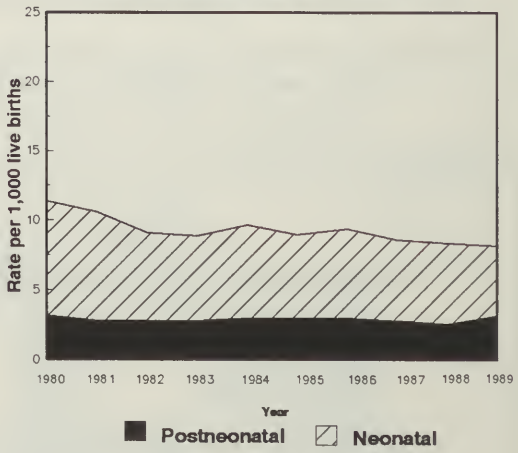
Births, Infant & Maternal Deaths, and Abortions--Maryland, 1980-1989

June 1993

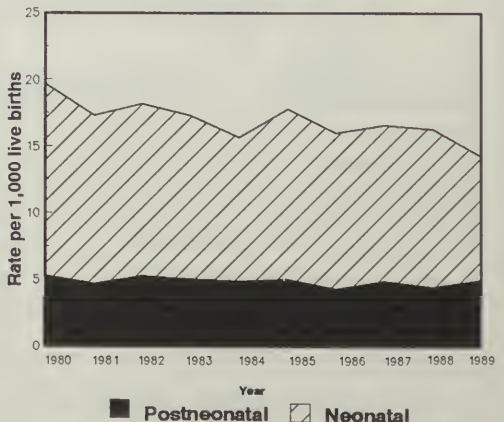
Contributed by Norma Kanarek, Ph.D., Director, Office of Planning, Evaluation and Program Development, Russell Moy, M.D., Director, Office of Maternal Health and Family Planning, Local and Family Health Administration and Estelle Apelberg, Research Statistician, Division of Vital Statistics, Department of Health and Mental Hygiene

Births



In 1989, 78,225 births were recorded among Maryland residents. Eighty-six percent of infants were delivered within Maryland. The majority of births (83%) outside Maryland occurred in Washington D.C.

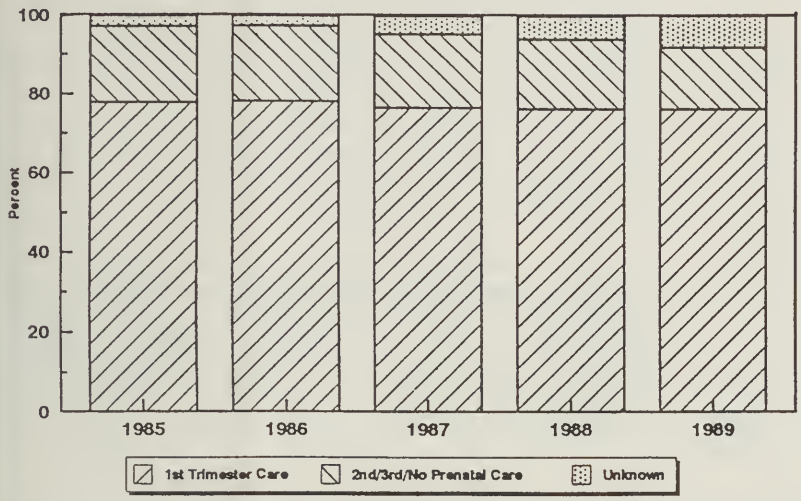
Births have increased an average of 2.7% annually for the last ten years. In 1980, 59,833 births were registered. Since 1980, the percent of infants who were delivered in Maryland (84% in 1980 vs 86% in 1989) and by physicians (99.4% vs 98.3%) has increased. The fertility rate has also increased though at a slower rate, since 1980 (57.4/1000 in 1980 vs 66.1 births/1000 population in 1989). Birth rates have increased among mothers of every age with the rate among women $\geq$ 35 years old, having doubled during these ten years. Nearly ten percent of all births in 1989 were to mothers 35 and older (see Table 1).



Infant Deaths

There has been a steady decline in the Maryland infant mortality rate throughout the decade of the 80's (Figure 1). Between 1985 and 1989 deaths before age 1 have averaged 823 per year. About two-thirds of the infant deaths occur in the first 28 days of life (neonatal). Over the decade, there has been a steady decline, for both races, in the neonatal mortality rate and in the proportion of all deaths occurring during this period of

Figure 1: Neonatal and Post-neonatal Mortality Among Whites, Maryland, 1980-1989.



Neonatal and Post-neonatal Mortality Among Nonwhites, Maryland, 1980-1989.

Source: MD DHMH Division of Health Statistics
***1989 Race of Mother is used to classify race of births**

Figure 2: Trimester of Prenatal Care, Maryland, 1985-1989

life. Postneonatal mortality started the decade at 3.9 deaths/1000 births and ended at 3.8/1000. The ratio of white to nonwhite infant mortality remained at about 1.75 throughout the decade.

Prenatal Care

Approximately three-fourths of births had early prenatal care (Table 1). Even so, prenatal care during the first trimester of pregnancy decreased between 1985-1989 (Figure 2). The unknown prenatal care category has tripled during this period. This probably indicates a change in reporting rather than a decline in early care or postponement of care. Health Department monitoring of this group at high risk of infant mortality is hampered by the large number of mothers with unreported prenatal care. Mothers with no care have increased from 0.8% to 1.1% during this period, an increase in a very high risk group of births.

Percent Low Birth Weight

During the 1980's, Maryland exceeded the U.S. on percentage of births which are under 2500 grams. Further, the percentage has increased annually since the decade low of 7.6% in 1985 (Table 1). This pattern is similar within races. This trend is also consistent with the excesses observed in Maryland's neonatal death rate. Perhaps as many as three quarters of all infant deaths occur among infants of low birth weight.

Teen Births

While the portion of births to mothers under 18 years old has decreased, the teen fertility rate increased between 1985-89 (Table 1). The rate of births to teens 15-17 was 13.9/1000 females in 1989, almost equal to the 1988 rate. The number of teens under age 15 giving birth has averaged 240 per year for 1985-89.

Jurisdictional Measures

The majority of Maryland births occur among the largest jurisdictions - Baltimore City (18%), Prince George's County (17%), Montgomery County (12%), Baltimore County (13%), and Anne Arundel (9%). The metropolitan areas of Maryland have 81% of the births with a small proportion in Western Maryland (7%), Eastern Shore (5%), and Southern Maryland (7%).

Poor birth outcomes cluster in Baltimore City and Prince George's County. A few of the small rural counties also have high rates of infant mortality, low birth weight, no prenatal care, and teen pregnancy (Table 1).

Maternal Deaths

Deaths related to pregnancy are rare and vary in their occurrence and the extent to which they are reported. Between 1985 and 1990 there were 3 to 11 maternal deaths reported per year (Table 2). No year has significantly more (or less) than expected. The DHMH estimates that death certificate reporting captures approximately 50% of maternal deaths, as is true throughout the U.S. In 1989 and 1990, three quarters of the pregnancy-related deaths were among nonwhite mothers.

Table 2. Maternal Deaths

	# Reported	# Expected*
1990	4	6.5
1989	11	6.2
1988	5	6.1
1987	3	4.8
1986	6	5.0
1985	3	5.3

*U.S. maternal mortality rate was applied to MD births

Abortions

Abortion surveillance, begun in 1970, is a *voluntary* system of providers reporting therapeutic abortions. In 1991, 18,095 abortions were reported obtained by Maryland women.

The majority of women obtaining an abortion were:

* not married (77%)
* urban residents (91%)
* age 18 years old or older (91%)

The majority of abortions are done:

* before 13 weeks gestation (94%) and
* by suction D & C (98%)

The median age of women having abortions is rising--from 21 years old in 1980 to 24 years in 1991. The percentage of abortions and births to females over age 25 has increased (Table 3).

Table 3. Births and Abortions by Age

	1980	1991
Percentage of births after age 25	54%	65%
Percentage of abortions after age 25	29%	45%

Conclusion: Reporting Needed

These data point out the need for accurate and complete reporting of births, deaths, and abortions. Birth and death certificates are mandated reports of vital events to be completed and submitted within 72 hours of the event. Not only must the legal portion of the certificate be filled out, but also the section containing confidential medical and health information must be completed in full. This portion of the birth certificate provides most of the measures essential to monitoring the health of infants and mothers. The cited cause of maternal death is frequently a non-pregnancy related designation. Physicians must be very specific and list any condition, including pregnancy, which is relevant to the death.

While abortion reporting is still voluntary in Maryland, reporting all abortions is encouraged. This reporting will enhance vital statistic's capacity (e.g., in distinguishing a therapeutic abortion outcome from fetal or infant death) and will provide data such as teen pregnancy rates and abortion to birth ratios.

Tips for Vaccine Adminstration, March 1993: Errata

Errata: In the "Tips for Vaccine Administration" article in the March edition of the Epidemiology and Disease Control Newsletter, Table 1. Recommendations for vaccinations by route of administration, is incorrect regarding the administration of rabies and typhoid vaccines. The table below is correct and should be used to replace Table 1 in the original article.

Table 1. **Recommendations for vaccinations by route of administration**

	IM	SC	ID	Oral
Vaccine(s)*	DTP, DTaP, DT, Td, Tetanus(adsorbed), Hib, Influenza, HBV, Rabies (pre- or post-exposure), Pneumococcal	MMR, eIPV, Pneumococcal, Typhoid fever (injectable-primary series 1&2)	PPD Mantoux, Rabies(pre-exposure), Typhoid fever (injectable-booster)	OPV Oral typhoid fever
Sites	Arm: deltoid muscle Leg: vastus lateralis	Outer aspect of upper arm or fatty area of anterior lateral aspect of thigh	PPD:inner forearm Rabies(pre-exposure) and Typhoid:outer aspect of upper arm	By mouth
Insertion angle	90° (perpendicular)	45°	5° to 15°	
Needle size	1", 22 or 23 gauge; ⅝", 25 gauge may be used if long enough to reach the substance of the muscle in infants	⅝", 25 gauge	½" or ⅝", 25 or 27 gauge	

* Abbreviations: Diphtheria-pediatric (D), Tetanus (T), Pertussis (P), Acellular Pertussis (aP), diphtheria-adult (d), Haemophilus influenzae type b (Hib), Hepatitis B (HBV), Measles Mumps Rubella (MMR), Oral Polio (OPV), Enhanced Inactivated Polio (eIPV); though not a vaccine, Purified Protein Derivative (PPD) is included as a commonly used injectable.

PHYSICIANS WANTED

Semi-retired or retired OK/physicians for pleasant office practice part-time. Call 547-2686.

EMERGENCY MEDICINE PHYSICIAN

Full service 183 bed acute hospital seeks an experienced BC/BP Emergency Medicine Physician to work in our Emergency Department and Convenient Care Centers averaging 30,000 visits/yr. Memorial Hospital at Easton is located on Maryland's historic Eastern Shore, with easy water access to the Chesapeake Bay and 90 min. from Baltimore, Washington, DC, and ocean beaches. Competitive compensation/relocation packages includes malpractice insurance. Please send CV to: Karen Weisman, Memorial Hospital, 219 S. Washington, Easton, MD 21601. 1-800-354-6072 ext. 5638.

PSYCHIATRISTS

ADULT AND CHILD PSYCHIATRISTS. Applications are invited both suitably qualified psychiatrists for both full and part-time leadership positions in an expanding group practice. The successful psychiatrists will become active participants in a managed-care friendly, multi-specialty practice offering a full range of mental health services, primarily in an outpatient setting. Candidates must be board certified/board eligible in Maryland and will be expected to obtain hospital privileges in one or more area facilities. Positions offer excellent opportunity in an organization positioned to benefit from health care reform. Practice is located in Baltimore, with easy access to the Inner Harbor and to Washington, D.C. Competitive salaries and a comprehensive benefit package. Send résumé/vita to PSYCHIATRIST, Medipsych Services, 3701 Old Court Rd., Ste. 16, Balto., MD 21208.

PRACTICE FOR SALE

Established general surgery practice in Silver Spring. Office is well equipped, has computer system. Free Parking. Excellent location. 301-593-0219.

PRACTICE FOR SALE

Anne Arundel county. Lucrative GYN practice. Excellent OB potential. Reply to Box #14.

OFFICE FOR LEASE

Available short- or long-term, part-time/full-time. Fully equipped, suitable for a wide range of specialties. Location: Professional Centre, adjacent to St. Joseph Hospital. Call 410-337-1586.

FOR LEASE

1,200 square feet 120 Sister Pierre Drive. Professional Centre, 1st floor. Next to St. Joseph Hospital. Please call 825-1982 for details.

MEDICAL OFFICE SPACE TO SUBLET

Atrium at Greenspring: spacious examining rooms some with sinks and cabinets. Free parking. Call 484-2121.

FOR SALE

Complete set of office furniture, equipment and lab equipment for sale in Montgomery county. Suitable for all specialties. Please call after 4 p.m. 301-983-1381.

OFFICES FOR RENT

1,354 sq. ft. suite in Severna Park on Ritchie Hwy. Already set up with cabinets, counters, sinks, lab area. Suitable for wide range of specialties. Up to 5,000 sq. ft. available in St. Michael's MD. Ideal for clinic. Owner will participate in set-up of offices. Call 410-544-2602 for information.

BEL AIR OFFICE TO SHARE

OB/GYN practice wishes to sublease space in new professional building with on-site parking. 2 consult & 3 exam rooms available. Suitable for Internist or Surgical Specialty. Please contact Lorraine O'Connor at 339-7640.

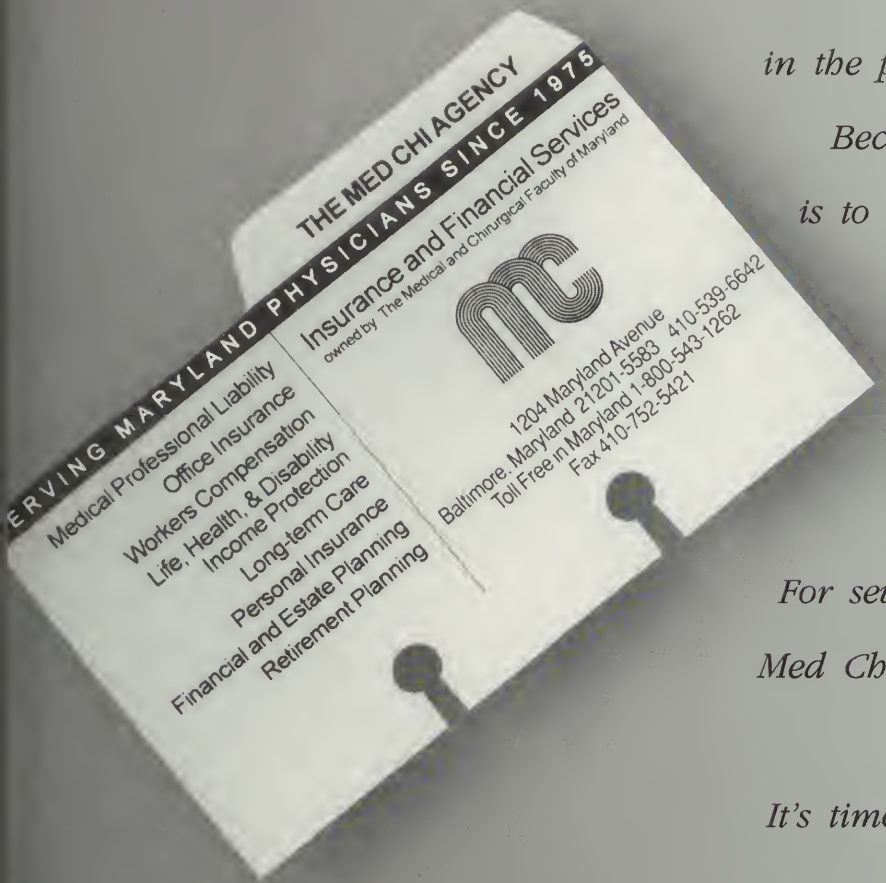
LABORATORY MACHINE FOR SALE

Dupont Analyst-Dry Chemistry Profiler. New in 1991, runs 12 test Chem screens, lipid profiles, glucose. Best offer. Call 410-252-1647.

FOR SALE

X-ray equipment including 300 MA rotary table with stand, hand tilt table, transformer, auto processor/dryer & misc. equipment - $3,500. Contact L. Gruss 687-8777.

MMJ Classified Advertising



Prepayment is required for all classified advertising.

- Cost for Med Chi members is $5.00 per 35 characters or portion thereof (each letter, number, symbol, punctuation mark, or space counts as one character).
- Cost for nonmembers is $8.00 per 35 characters or portion thereof with a minimum cost of $50.00 per advertisement.
- Advertisements placed for the benefit of an HMO or a hospital are charged the nonmember rate.
- Advertisements for services (e.g., collection agencies) or for items not related to the practice of medicine (e.g., real estate sales) are limited to a maximum of three placements per calendar year.
- Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physicians's practice or equipment.
- Box numbers are provided free of charge.
- Advertising copy and payment (checks should be made out to *Maryland Medical Journal*) should be sent seven weeks prior to the first of the month in which the advertisement is to appear.

Box replies, advertising copy, and prepayments should be sent to:

Another Kind of Investment. It's Boring!

With this investment, you get no black tie...no sip of Dom...no rush of watching dice bound over the green felt. So, if the thrill of the gamble drives your investing, we can't dance. Our investment is boring. For us there are no administrative costs and no sales commissions. But for our investors, there are no anxious moments. For our investors, the average annual yield over the past five years has exceeded 10%. But their investment is nap-inducing. Our investors watch the mailbox (rather than the agate print in The Wall Street Journal) to measure their gains, because each of them receives a monthly check. But they yawn all the way to the bank. You see, with a 1% risk factor in this investment, the gamble simply isn't there. That's why we never get to dance with the high rollers who love the epinephrine flow that comes with the gamble. For more information about this ho-hum investment, call toll free: **800/876-6784.**

Chief Executive Officer's Newsletter

July 1993

Upcoming Meetings - Mark your calendars!

- 1993 Med Chi Semiannual Meeting — September 10 - 12, 1993, Sheraton Ocean City Resort and Conference Center. (Preliminary program follows this issue of the Chief Executive Officer's Newsletter.)
- President's Eastern Regional Conference — October 19, 1993, Cambridge Yacht Club, Cambridge
- President's Western Regional Conference — November 11, 1993, Sheraton, Hagerstown
- 1994 annual meeting — May 12 - 14, 1994, Ramada Convention Center, Hagerstown

Fourth Annual Conference on Addiction

The Committee on Scientific Activity and the Physician Rehabilitation Committee of Med Chi are proud to announce the upcoming fourth annual conference on addiction to be held Saturday, December 11, 1993, 7:30 am - 6:00 pm, at the Sheraton BWI Conference Center.

Speakers for this year's conference will include Max Schneider, M.D., a nationally renowned physician educator in the field of addiction medicine, and Joseph Gagliardi, M.D., an educator for the Med Chi Substance Abuse Program. Topics being planned include: The Biomedical Aspects of Treatment and Recovery, Treating the Opiate-Addicted Patient, The Nature and Status of Substance Abuse Treatment, The Future of Drug Control Policy in America, The Need for Greater Access to Treatment and Helping the Helpers.

Medicare's medical policy on consultations

Please see the revised medical policy on consultations that follows this issue of the Chief Executive Officer's Newsletter. This policy affects billing of pre-operative and postoperative consultations by nonsurgeons.

Baltimore City Medical Society receives award

The Baltimore City Medical Society (BCMS) received the Associations Advance America Honor Roll Award for its program to provide medical care to Baltimore's homeless population. The BCMS Young Physicians Committee spearheaded the project to assist Health Care for the Homeless, Inc. (HCH) in meeting the medical needs of homeless people in Baltimore. Over 100 physicians participate in the program by providing care at the HCH clinic, seeing patients in their own offices, contributing funds for transportation costs to medical services, or collecting sample medications needed by the clinic.

The Association's Advance America Awards are given annually by the American Society of Association Executives to recognize significant contributions by associations in education, product and safety standards,

professional standards and codes of ethics, research and statistics, international activities, and community service.

Baltimore City Health Department celebrates 200th anniversary

September 1-2, 1993, the Baltimore City Health Department will hold a 200th Anniversary Celebration Conference at the Baltimore Convention Center. Med Chi will be exhibiting at the conference. The August issue of the *MMJ* will focus on the health department's bicentennial.

National invitational conference on managed eye care

Managed Eye Care: Paradigms & Pathways, a national invitational conference for physicians and practice administrators which details the history and success of Managed Eye Care (MEC) of Maryland, will be held in Baltimore on October 23, 1993. See CME Programs, pages 699 - 702 for details.

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

Medical Policy

SUBJECT: **Consultations**

EFFECTIVE DATE: **6/28/93**

CPT/HCPCS Code(s): **99241 - 99245, 99251 - 99255, 99261 - 99263, 99271 - 99275**

Description of Service: A consultation includes services rendered by a physician whose opinion or advice is requested by another physician for further evaluation and/or management of the patient. A consultant is expected to render a written opinion only. If the physician assumes responsibility for any aspect of patient management, he/she has taken over the patient's care and any subsequent services will cease to be consultations but may be allowed as follow-up hospital or office visits.

Clinical Indications: A consultation must include the patient's history and examination as well as a written report which the consultant furnishes to the attending physician for inclusion in the patient's medical records. Included in the consultation can be the writing of orders initiating diagnostic and/or therapeutic services if requested by the attending physician. If there is only an initial consultation and usually one follow-up consultation, it will be assumed the physician has not taken over the care of this patient. A follow-up consultation is the consultant's re-evaluation of a patient, usually at the documented request or approval of the attending physician. If the physician bills for regular and frequent follow-up consultations, it will be assumed that he/she has taken over management.

Billing Instructions: Consultations will be processed according to the appropriate level of care based on the diagnosis submitted on the claim and the content of the service provided. This will include the extent of the history, physician exam and degree of

decision making required. Only 1 initial consultation per patient's hospitalization per consultant will be allowed.

A physician (primary care or specialist) who performs a pre-operative consultation for his or her new or established patient at the request of a surgeon may bill the appropriate consultation code as long as all of the criteria for the use of the consultation codes are met. The following requirements for use of the Current Procedural Terminology (CPT) codes are the most pertinent in this case:

- The surgeon must request opinion or advice regarding evaluation and/or management of a specific problem.
- The surgeon's request for a consultation and the need for consultation must be documented in the patient's medical record.
- The consultant's opinion and any services ordered or performed must be documented in the patient's medical record and must be communicated to the surgeon.
- The physician must have provided all of the services necessary to meet the CPT description of the level of code billed.

The patient's medical record should support that these criteria are met. The following documentation guidelines apply:

- In an inpatient setting, the request may be documented as part of a plan written in the requesting surgeon's progress note, an order in a hospital record, or a specific written request for the consultation. In an office or other outpatient setting, the request may be met by a specific written request for the consultation from the requesting surgeon or the physician's records may show a specific reference to the request.
- The medical record should identify the specific problem which was the reason for the consultation, describe the extent of the history, physical, and medical decision making that supports the level of consultation code billed, and include the consultant's

findings and recommendations to the requesting surgeon.

If any of these criteria are not met, the physician may not bill the encounter as a consultation. For example, the physician should not bill for a consultation if:

- There is not a specific request from the surgeon to the consultant for the consultation (for example, the patient is handed a form by the hospital or surgeon's staff and is told to have his or her physician fill it out); or

- There is not a report from the physician to the surgeon for his or her use prior to the performance of the procedure.

If subsequent to the completion of a pre-operative consultation in the office or hospital, the physician assumes responsibility for the management of a portion or all of the patient's condition(s) during the post-operative period, the office consultation, initial inpatient consultation or follow-up inpatient consultation codes should not be used. In the hospital setting, the physician who has performed a pre-operative consultation and assumes responsibility for the management of a portion or all of the patient's condition(s) during the post-operative period should use the appropriate subsequent hospital care codes (not follow-up consultation codes). In the office setting, the appropriate established patient code should be used during the post-operative period.

A physician (primary care or specialist) who performs a post-operative evaluation of a new or established patient at the request of the surgeon may bill the appropriate consultation code for evaluation and management services provided during the post-operative period following surgery as long as all of the criteria for the use of the consultation codes are met and that same physician had not already performed a consultation pre-operatively (see above).

However, if the surgeon does not request the physician's opinion or advice and simply refers the patient for the management of an aspect of the patient's condition during the post-operative period, the physician may not bill a consultation. The physician's services would constitute

concurrent care and should be billed using the appropriate level visit codes.

The requirements for use of the CPT consultation codes discussed with the respect to pre-operative consultations also apply in determining if the physician should bill an encounter during the post-operative period as a consultation or a visit.

For example, if the surgeon requests the opinion or advice of a physician regarding a specific problem that has arisen following the surgery and also requests that the physician assume responsibility for the management of that problem during the post-operative period, the physician may bill the initial encounter with the appropriate consultation code and subsequent encounters with the appropriate subsequent hospital care codes. This example applies whether the patient is new or established to the physician.

A consult initiated by a patient and/or family and not requested by a physician is not reported using the initial consult codes but may be reported using the codes for confirmatory consultation or office visits.

The UPIN of the physician requesting the consultation must be documented on the claim. For services 1/1/92 and after, the claim will be denied if the UPIN is not inserted.

Approved by: Barry S. Gold MD.

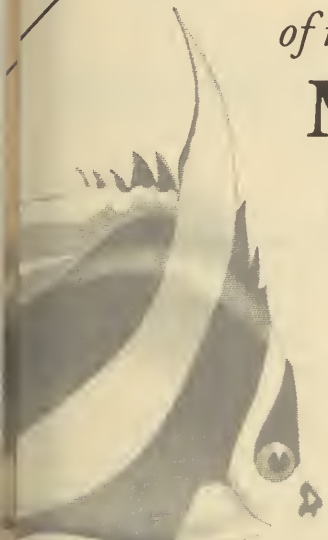
PRELIMINARY PROGRAM

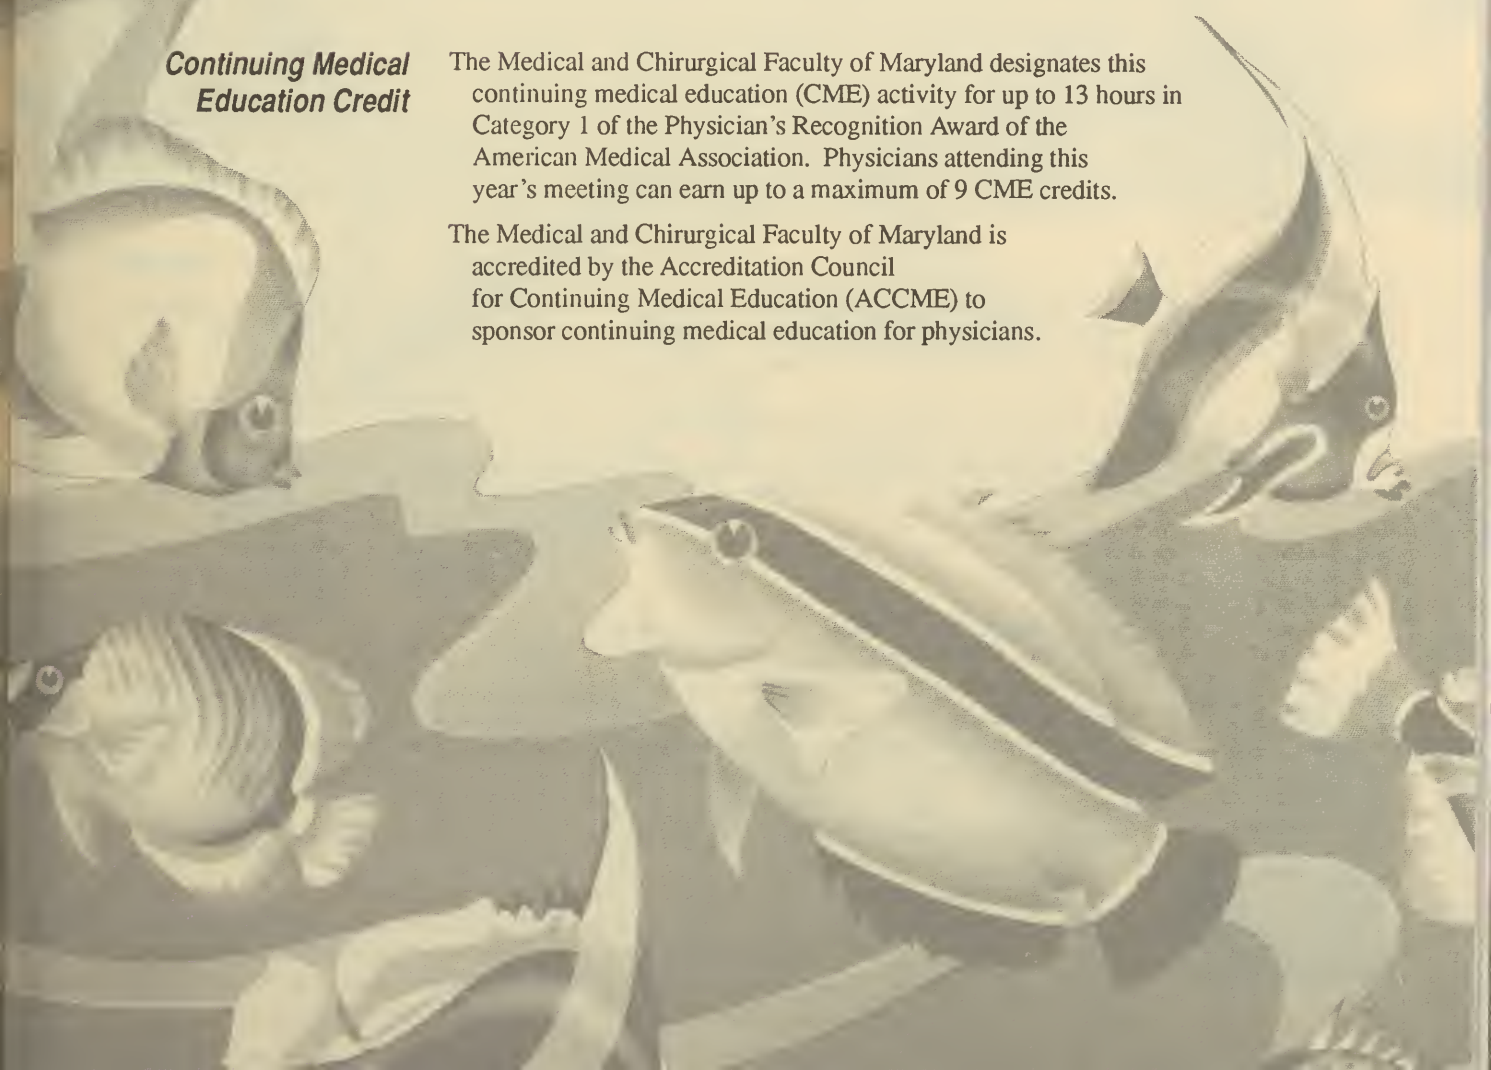


1993 Semiannual Meeting

of the

Medical and Chirurgical Faculty of Maryland

at the



Sheraton Ocean City Resort and Conference Center
Ocean City, Maryland
Friday - Sunday, September 10 - 12, 1993

Continuing Medical Education Credit

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education (CME) activity for up to 13 hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Physicians attending this year's meeting can earn up to a maximum of 9 CME credits.

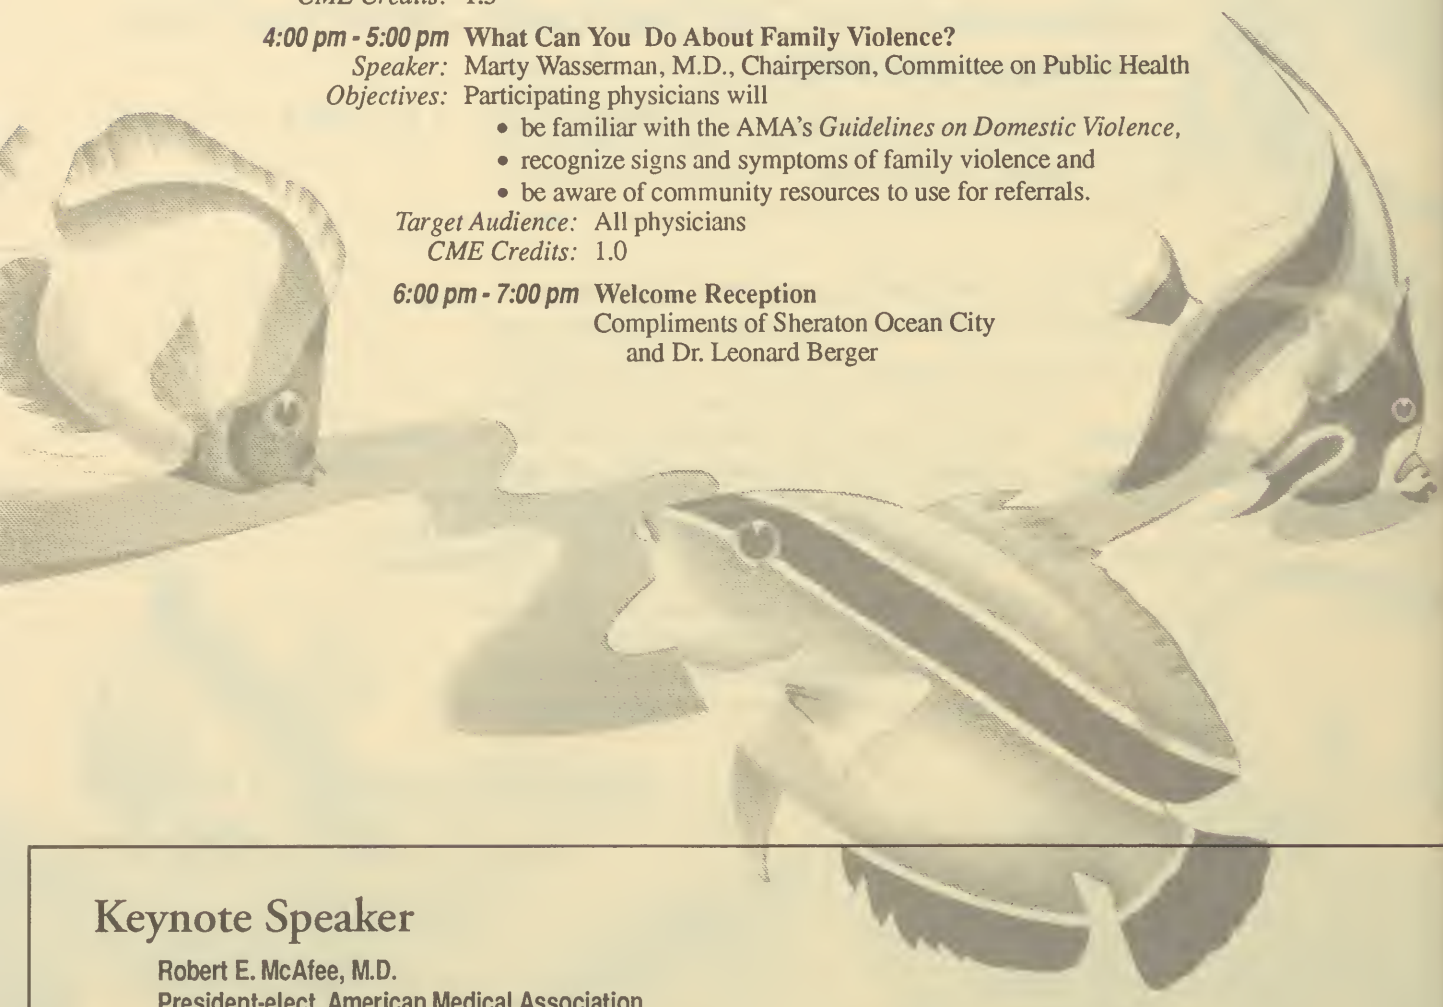
The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

Friday, September 10

12:00 noon - 5:00 pm **Registration/Exhibits**

1:30 pm - 3:00 pm **Council Meeting**
Welcome—Allan D. Jensen, M.D., Council Chairperson
Opening Remarks—Robert E. McAfee, M.D., President-elect, American Medical Association

3:00 pm - 4:00 pm **Break — Visit the Exhibits**



4:00 pm - 5:30 pm **Anxiety Disorders: Identification and Treatment**
Speaker: Kevin S. Ferentz, M.D., Associate Professor of Family Medicine, University of Maryland; Residency Director
Objectives: Participating physicians will be more knowledgeable about
- the epidemiology of anxiety disorders,
- specific anxiety disorders as listed in the *DSM-III-R* and
- pharmaceutical and nonpharmaceutical management of anxiety disorders.

Target Audience: Primary care physicians
CME Credits: 1.5

4:00 pm - 5:00 pm **What Can You Do About Family Violence?**
Speaker: Marty Wasserman, M.D., Chairperson, Committee on Public Health
Objectives: Participating physicians will
- be familiar with the AMA's *Guidelines on Domestic Violence,*
- recognize signs and symptoms of family violence and
- be aware of community resources to use for referrals.

Target Audience: All physicians
CME Credits: 1.0

6:00 pm - 7:00 pm **Welcome Reception**
Compliments of Sheraton Ocean City and Dr. Leonard Berger

Keynote Speaker

Robert E. McAfee, M.D.
President-elect, American Medical Association

Dr. McAfee, a surgeon practicing in South Portland, Maine, served as vice-chairperson of the American Medical Association (AMA) Board of Trustees from June 1990 to 1992. He served as a member of the Executive Committee of the board from 1988 to 1992. He was appointed to serve as an AMA commissioner to the Joint Commission on Accreditation of Healthcare Organizations in January 1986 and continues in that capacity. He also served as president of the AMA Education and Research Foundation from 1986 to 1988, and as its secretary-treasurer from 1985 to 1986.

Born in Portland, Maine, Dr. McAfee received his M.D. degree from Tufts University School of Medicine in 1960. He completed his residency in general surgery at Maine Medical Center in 1965. where he served his internship. He is a diplomate of the American Board of General Surgery, an attending surgeon at the Maine Medical Center and chief of vascular surgery at Mercy Hospital in Portland. He is also an associate professor of surgery at the University of Vermont.

Saturday, September 11

7:15 am - 5:00 pm **Registration /Exhibits**

7:30 am - 9:30 am **Medicine on Trial: An Interactive Risk Management Program for Physicians**
Medical Mutual Liability Insurance Society of Maryland (Med Mutual will give a 5% premium discount on 1994 individual liability renewal policies to its members who attend this program. To receive the premium discount, there is a $40 program fee.)

Speakers: Thomas G. Chiccone, M.D., Capital Emergency Associates
Beth Petree, Claims Representative, Med Mutual

Objectives: Participating physicians will
- be able to identify pertinent patient care issues,
- increase their knowledge of diagnostic and therapeutic modalities,
- understand a medical malpractice claim and become more aware of risk management skills.

Target Audience: All physicians
CME Credits: 2.0

8:00 am - 9:30 am **Step-by-Step: Documenting Your CME Program**

Speakers: William L. Thomas, M.D., Chairperson, Committee on Continuing Medical Education Review and invited panel

Objectives: Participating physicians will better understand
- what documentation is necessary to demonstrate compliance with the seven "Essentials" and
- how to document compliance with the "Standards for Commercial Support of CME."

Target Audience: All physicians involved with the planning of continuing medical education activities.
CME Credits: 1.5

9:30 am - 10:00 am **Break—Visit the Exhibits**

10:00 am - 12:00 noon **Plenary Session—Health System Reform: The Effect on Patient Care**

Speakers: Robert E. McAfee, M.D., President-elect, American Medical Association
Robert Pulliam, M.D., President, West Virginia Medical Society
The Honorable Casper R. Taylor, Jr., Chairperson, House Economic Matters Committee, Maryland House of Delegates
The Honorable Gary R. Alexander, Speaker Pro Tem, Maryland House of Delegates

Objective: Participating physicians will be informed about the most recent developments in health system reform.
CME Credits: 2.0

12:00 noon - 12:30 pm **Break—Visit the Exhibits**

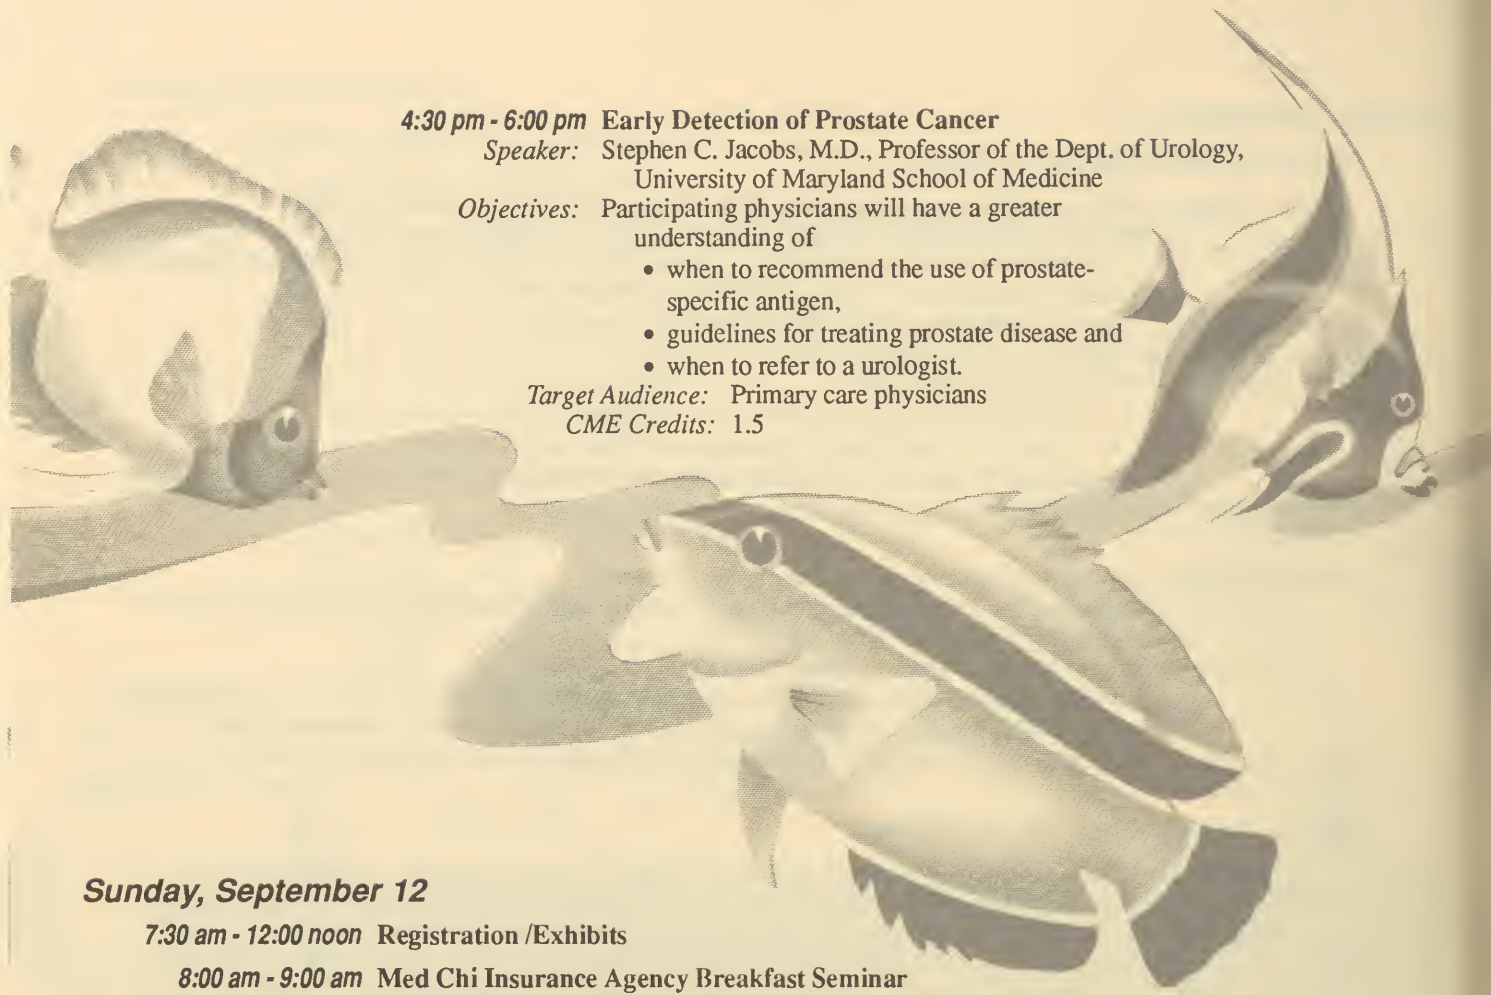
12:30 pm - 1:30 pm **Luncheon —Peer Review: Current Issues in Medical Discipline**

Speakers: Ronald Cohen, M.D., Chairperson, Peer Review Management Committee
Israel H. Weiner, M.D., Chairperson, Board of Physician Quality Assurance

Objectives: Participating physicians will
- learn about recent peer review and medical discipline issues encountered by the Board of Physician Quality Assurance and the Peer Review Management Committee and
- understand the role of the Med Chi peer review committees in the state medical discipline process.

Target audience: All physicians
CME Credits: 1.0

1:30 pm - 3:30 pm **House of Delegates Meeting**
Introductory Remarks—Joseph Snyder, M.D., President, Med Chi



3:30 pm - 4:30 pm **Break—Visit the Exhibits**

4:30 pm - 6:00 pm **It's Just Arthritis — Take Some Aspirin**

Speaker: Ira T. Fine, M.D., Chief, Division of Rheumatology, Sinai Hospital

Objectives: Participating physicians will be aware of
- the different types of arthritis,
- appropriate diagnostic approaches and appropriate therapeutic interventions.

Target Audience: Primary care physicians
CME Credits: 1.5

4:30 pm - 6:00 pm **Early Detection of Prostate Cancer**

Speaker: Stephen C. Jacobs, M.D., Professor of the Dept. of Urology, University of Maryland School of Medicine

Objectives: Participating physicians will have a greater understanding of

- when to recommend the use of prostate-specific antigen,
- guidelines for treating prostate disease and
- when to refer to a urologist.

Target Audience: Primary care physicians

CME Credits: 1.5

Sunday, September 12

7:30 am - 12:00 noon **Registration /Exhibits**

8:00 am - 9:00 am **Med Chi Insurance Agency Breakfast Seminar**
The Age-Favored Retirement Plan: A New Concept for Qualified Retirement Planning

Speaker: Michael H. Korthaus, Pension Specialist, Safeco Life Insurance Company

Objectives: Discussion of qualified retirement plans and the advantages of a new flexible concept that has become the answer for many professional practices where the owners and executives tend to be older and more highly compensated.

Target Audience: All physicians and spouses (LIMITED TO 50—PREREGISTRATION REQUIRED)

9:00 am - 10:00 am **Medicine in Maryland: The Practice and the Profession**

Speaker: Jane Elliott Sewell, Ph.D., History of Medicine Scholar

Dr. Sewell will discuss the diversity of practices, the evolution of medical education and governing institutions, medical milestones in Maryland and the way changing social, economic and cultural settings interacted with the medical arena. A history of medicine scholar, she is researching a history of Maryland medicine for Med Chi's bicentennial.

9:00 am - 10:00 am **The Recovering Physician — Physician Rehabilitation**

Speaker: John R. Steinberg, M.D., President, Maryland Chapter of the Amer. Society of Addiction Medicine

Panel: Recovering physicians

Objectives: Participating physicians will gain an increased understanding of

- the bio-psycho-social aspects of the addictive process,
- specific aspects of the impact of addiction on the life of a physician,
- the recovery process and the traits of a stable recovery and
- how to recognize the symptoms of a relapse process.

Target Audience: All physicians

CME Credits: 1.0

10:00 am - 10:30 am **Break—Visit the Exhibits**

10:30 am - 12:00 noon **Maryland's Waterfront - The State's Treasure**

Speaker: Steve Leatherman, Ph.D., professor and director, Laboratory for Coastal Research, University of Maryland, College Park

This highly informative and entertaining session, intended for all physicians and their families, will provide details on the Ocean City ecosystem.

Support our Exhibitors

Exhibits are an integral part of the Med Chi Semiannual Meeting and are a valuable adjunct to the scientific program.

During this year's semiannual meeting, Med Chi has allocated several special time periods for physicians to meet one-on-one with exhibitors. By visiting the exhibits, you will help ensure that Med Chi continues to receive valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

Special Exhibit Time Periods:

Friday, September 10: 3:00 pm - 4:00 pm
Saturday, September 11:
9:30 am - 10:00 am 12:00 pm - 12:30 pm 3:30 pm - 4:30 pm
Sunday, September 12: 10:00 am - 10:30 am

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

LETTERS TO THE EDITOR

Maryland ranks number two in public health

In its 1992 report, *America's Public Health Report Card*,[1] the American Public Health Association described a public health crisis in America—a crisis where Americans are at risk for such preventable diseases as AIDS (acquired immunodeficiency syndrome) and tuberculosis, where Americans are victimized by violence and preventable injuries, and where we endanger our own lives by unsafe lifestyle behaviors. To make matters worse, these public health problems are spreading due to poverty, poor education, environmental neglect, and lack of access to preventive health care. Additionally, while our condition worsens, we are already behind other developed nations in such areas as infant mortality and in the rate of infants born of low birth weight.

The American Public Health Association (APHA) report ranked all states on how well they are meeting their public health needs. The ranking was based on public health determinants common to all states. Five basic determinants were selected. When present, they represent the presence of a healthy society.

1. ***Access to medical care*** includes adequacy of prenatal care, access to primary care, Medicaid spending per capita, the number of primary care physicians per capita, the percentage of uninsured people, and the ratio of Medicaid recipients to poor people.
2. ***Health environment*** includes cleanliness of the air, safety of drinking water, fluoridation of the water supply, and the number of work-related injury claims.
3. ***Healthy neighborhoods*** includes funding for education, rates of on-time high school graduation, the level of income maintenance for the poor, taxes on cigarettes, unemployment, child poverty, violent crime, and motor vehicle deaths per 100,000 miles driven.
4. ***Healthy behaviors*** includes rates of obesity, binge drinking, smoking, and non-use of seat belts.
5. ***Community health services*** includes state and local government spending on community health programs, the number of public health workers per capita in the state, and the state's per capita spending on sanitation and sewerage.

For each determinant, a ranking of states by quartile was made, placing each state and the District of Columbia in the first (best), second, third, or fourth (worst) quartile. Maryland ranked in the first quartile in medical care access, in the first quartile for health environment, in the first quartile for healthy behaviors, and in the second quartile for community health services. Assuming an equal weight to each category, Maryland ranked number two in the nation, second only to Hawaii. While this is an admirable record, we must, as the Avis Rental Care company said in the 1980s, "try harder."

Under each of the five determinants, there were three to eight subtopics for which the APHA also reported rankings per state. Although, overall, Maryland scored high, there were six subtopics of particular concern according to the APHA ranking (three of which fell un-

der the healthy neighborhoods determinant): environmental pollution, where Maryland ranked 34th among the states; the violent crime rate, where Maryland ranked 47th; education spending per capita, where Maryland ranked 23rd; graduation rate, where Maryland ranked 27th; smoking rate, where Maryland ranked 30th; and government health spending per capita, where Maryland ranked 37th.

All of us who work in the health field must rededicate ourselves to educating our fellow citizens and making a commitment to secure a broad health policy that will improve the social, economic, and environmental factors affecting the public's health.

KIRSON
MEDICAL EQUIPMENT

When you prescribe home oxygen, you can specify the provider with the most experience - it's your call...

It's too important to leave to chance. That's why you should call Kirson . . . the acknowledged leader in home medical equipment. Whether you prescribe oxygen concentrators, gas or liquid systems, more physicians and therapists recommend **Kirson** than any other medical equipment company.

Serving Baltimore, Washington and Northern Virginia

"People who care for people who need care"

Donald "Ted" Lewers, M.D., AMA trustee

Vivian Smith

Ms. Smith is public relations director for Med Chi.

Donald "Ted" Lewers, M.D., a nephrologist and internist from Easton, Maryland, and a past president of the Medical and Chirurgical Faculty of Maryland (Med Chi), made history on June 16, 1993, when he became the first physician from Maryland's Eastern Shore to be elected to the American Medical Association (AMA) Board of Trustees. Dr. Lewers has served on the AMA Council on Legislation since 1987, and was elected council chairperson in 1992. In recent years, Dr. Lewers has represented the AMA at the White House, and before Congress and multiple regulatory agencies. In addition, he has chaired the AMA Ad Hoc Committee on CLIA (clinical laboratory improvement act), and assisted in the organization and operation of the RBRVS (resource-based relative value scale) Update Committee (RUC) where he served as vice-chairperson. Dr. Lewers has been a member of the AMA Technical Advisory Committee (TAC) and represented the AMA on the Editorial Council of the Thompson Publishing Group.

Since 1984, Dr. Lewers has been a member of the AMA House of Delegates, serving first as an alternate delegate and, since 1985, as a delegate from Med Chi. Long active in organized medicine, Dr. Lewers has held all positions of leadership at Med Chi, including president from 1985 to 1986. While president-elect (1984 to 1985), Dr. Lewers took a leave of absence from his practice to be a full-time lobbyist for Maryland physicians. That year, among other legislative victories, he helped pass the most significant tort reform package in Maryland history.

In a recent interview, Dr. Lewers responded to questions about his election, background, and activities.

◆ **Smith:** What has been your reaction to being elected to the AMA Board of Trustees?

Lewers: One of awe. I obviously feel great pride and great joy, but it is humbling to think that I was able to win on the first ballot with the incumbents. This is the highest honor I have ever experienced and the highest honor medicine could bestow upon me at this time. It is a little frightening to think of some of the issues and the amount of work, but I have had a lot of experience and I feel I am capable of doing the job.

◆ **Smith:** What is your role as a member of the AMA Board of Trustees?

Lewers: It's a great responsibility to be a trustee of the most powerful medical association in the world. As trustee, I will be representing the physicians of this country, whether they are AMA members or not. I will deal with everything from science to politics. It is a real challenge.

Figure 1. Dr. Lewers campaigns at the AMA annual meeting.

◆ **Smith:** What are your goals as a Board of Trustees member?

Lewers: One goal is to be able to balance the many aspects of every issue of medicine and, by doing so, make decisions with the best interests of the patients, the physicians, and the AMA in mind.

Another goal is to assist in the unification of the profession and in enhancing communication. If we can not communicate with each other and with the public, and present a unified force, then health care will be threatened.

◆ **Smith:** When did you first become interested in medicine?

Lewers: I knew when I was in high school that I wanted to go to medical school. Interestingly, my guidance counselor advised me to be a salesman. She told me, "Don't go to college. Get a job, and go to work and sell."

◆ **Smith:** Why did you choose nephrology?

Lewers: It was the influence of Dr. Frank Borges, a nephrologist at the University of Maryland. He peaked my interest in the field. In nephrology, you use virtually all aspects of medicine, so it is like general practice with a specialty.

◆ **Smith:** What were some highlights of your medical school experience?

Lewers: When I was a second-semester freshman, I was selected to work directly with Dr. Ted Woodward on a pilot clinical program. That was probably one of the greatest things—besides my wife—that ever happened to me.

Dr. Woodward instilled in me the love of medicine—not only the science of medicine, but the art of medicine. He taught me how to present cases, what to look at, and how to do a physical examination. More than that, he taught me the art of medicine. The art of medicine is probably easiest to define in negative terms—what science is not. It is dealing with a patient, knowing how to talk to that patient, knowing when to be stern, and when to be the father figure. The art of medicine is dealing with people. It's the finite difference between medicine and any other profession. It is something only a doctor can understand, and it is difficult to teach. But, Dr. Woodward is a master, and he imparted the art to me. I really owe everything to him; he is my father in medicine.

◆ **Smith:** What has been your greatest satisfaction during your career?

Lewers: The opportunity to be a doctor, to be part of the profession, to have people rely on me, depend on me, and have faith in me. That is what medicine is all about. The greatest part about being a physician is not the primary gain, or the financial gain, but the secondary gain of knowing that people are relying on you for the most important thing in life—their life.

There have been various phases of my career when different things have been the most important. Being elected to the AMA Board of Trustees, being president of Med Chi, and being chairperson of my own division have all been satisfying times. When I look back, I realize the most satisfying aspect of my career is that people needed me, people wanted me, people have respected me—the doctor/patient relationship.

◆ **Smith:** How did your experience as full-time lobbyist for Med Chi affect your views of medicine?

Lewers: The biggest thing that happened during that time period was that I really learned to listen. I learned there are

Figure 2. Dr. and Mrs. Lewers announce the grand door prize at the Med Chi Season-a-Sundae campaign hospitality event, held Tuesday, June 15, 1993.

several ways to look at medicine. As an individual you look at it one way, and as a doctor you look at it another way. Most physicians don't have the opportunity to debate the issue of medicine with individuals representing society who can put controls on medical practice.

As a lobbyist, I had to defend organized medicine's position in a way that always kept the patient in mind. The impact on the profession is critical; the impact on the patient is primary, and being able to debate that issue was the biggest element. I had to look at all aspects of medicine and defend certain issues. I also had to be able to compromise. The ability to look at the practice of medicine from someone else's eyes and be able to defend it was the greatest challenge of that experience.

◆ **Smith:** How has the field of medicine changed since you became a physician?

Lewers: The science has changed dramatically, but the biggest change in the practice of medicine is the interference from nonmedical forces. When I first went into practice, physicians did what they thought was best for the patient and that was it. We didn't worry about whether it would be paid for, whether insurance companies would approve it, or what the federal government was going to say.

Figure 3. Henry Wagner, Jr., M.D., AMA delegate, and Robert E. McAfee, M.D., AMA president-elect, sing along at the Season-a-Sundae campaign hospitality event.

Figure 4. Mrs. Pat Lewers and Dr. Lewers at the AMA Annual Meeting. (© 1993 Donald J. Palmisano, M.D., New Orleans)

◆ **Smith:** How has organized medicine faced this change?

Lewers: They have faced it with a great deal of frustration. A lot of people blame organized medicine, but I don't think that's right. This is a societal issue—what society seems to want.

I think organized medicine has been staunch in its defense of the practice of medicine and the physician. Most people, particularly the press, do not realize that organized medicine, while certainly protecting and working for its members, has patients' best interests at heart. I believe the cost and issues of medicine have driven health care to a point where society must say, "This is what we want."

◆ **Smith:** How will being a trustee affect your office practice?

Lewers: It will affect it greatly. I am a solo practitioner with about 80% nephrology and 20% internal medicine patients. I have six physicians with whom I work in rotation, and they have been fantastic.

I have a physician's assistant and a great office staff who have helped me with all the changes. My patients have been very understanding, and even though I have been traveling a great deal, I have been able to maintain my office hours. The demands of being a trustee will stress the office, but my coverage has been great, and the only way I have been able to achieve this is with the help of my staff and colleagues.

◆ **Smith:** What are your plans for the future?

Lewers: My plans are to do the best job I can as a trustee. I enjoy what I do in organized medicine. I hope to spend my next nine years as a trustee, but that means being re-elected to the board twice. I would like to move into board leadership if I am successful as a trustee. At this point, I have just been elected, and I need to get acclimated to being a trustee.

Figure 5. Dr. Lewers thanks the AMA House of Delegates following announcement of his election to the AMA Board of Trustees.
(© 1993 Donald J. Palmisano, M.D., New Orleans)

Dr. Lewers currently practices nephrology and internal medicine in Easton, Maryland. He is a member of the active staff of Memorial Hospital at Easton. In addition to his practice, he is medical director of the Easton Renal Treatment Center, vice-chairperson of the Board of Directors of the Medical Mutual Liability Insurance Company of Maryland, and board chairperson and chief executive officer of The Health Enhancement Center, Inc.

Dr. Lewers serves his community as a member of the Chancellor's Advisory Committee of the University of Maryland Medical Systems and as a member of the Board of Visitors of the Center for Estuarine and Environmental Studies of the University of Maryland. He is trustee emeritus of Ducks Unlimited and past president of The Waterfowl Festival, Easton, Maryland.

Born December 16, 1934, Dr. Lewers received his BS degree from the University of Maryland in 1958 and his MD degree in 1964 from the University of Maryland School of Medicine. He completed his internship in 1965 at University Hospital in Baltimore, Maryland, and served his residency at Maryland General Hospital in Baltimore, Maryland. In 1969, Dr. Lewers completed a fellowship in nephrology at Georgetown University Hospital, Washington, DC.

Dr. Lewers and his wife, Pat, reside in Easton, Maryland, and have three grown daughters and two grandchildren. ■

What's up in the management of high-altitude pulmonary edema?

Elizabeth L. Tso, M.D., F.A.C.E.P., and T. James Wagner, Jr., M.D.

From the University of Maryland Medical System where Dr. Tso is associate professor of surgery and medicine and Dr. Wagner is a resident in emergency medicine.

ABSTRACT: *Each year, millions of people travel to high-altitude locales. High-altitude pulmonary edema (HAPE), a severe form of acute mountain sickness, is a potentially fatal complication of acute exposure to high altitude. HAPE usually occurs at elevations above 2,500 meters and typically develops in the setting of a rapid ascent to high altitude with inadequate acclimatization and continued physical exertion. Although prompt descent to lower elevation and supplemental oxygen remain the definitive treatment for HAPE, recent investigations indicate that administration of nifedipine or phentolamine may be effective prophylactic or temporizing therapies.*

Excerpted below is a personal account of high-altitude pulmonary edema (HAPE) as described by Oswald Oelz, M.D.[1]

> On September 10, 1986, I flew from Katmandu, Nepal (an altitude of 1,200 m), to an altitude of 2,800 m. I subsequently climbed in three days to a base camp at an altitude of 5,400 m on Mount Makualu (8,485 m). On September 16, two well-acclimatized friends and I ascended to 6,000 m. On the following day, we climbed via Kukuczka Ridge to an altitude of 6,900 m, where we established a camp. The climb was steep and demanding.
>
> ... having gone too high too fast, during the night I developed a rapidly worsening cough and shortness of breath. Even without a stethoscope, I could hear a bubbling in my lungs. Toward morning, I expectorated increasing volumes of frothy and later bloody sputum. I was barely able to get out of the tent owing to shortness of breath.
>
> Being all too familiar with the symptoms of HAPE and having no other options for treatment besides descent, I took 20 mg of nifedipine sublingually. Within 10 to 15 minutes, I noticed amelioration of my dyspnea and a reduction in sputum volume. I was able to ascend another 100 m on the ridge and could then traverse to easier ground. There I took 20 mg of a slow-release preparation of nifedipine and descended via the easy normal route to our base camp. During the following night, while lying in the tent, I had another episode of HAPE, which I confirmed this time with a stethoscope. My symptoms—which included rales—

promptly responded to another dose of 20 mg of nifedipine sublingually followed by 20 mg of the slow-release preparation. The following morning, I descended to 4,000 m and had no further respiratory problems.

Because air travel has increased our mobility, travelers can be transported from sea level to high altitude (elevations of 2,500 m and higher) in a few hours. Thus, a growing segment of the population can potentially develop HAPE. Annually, over 40 million people visit high-altitude locales for business or recreation[2] and may experience pulmonary symptoms caused by the acute drop in ambient oxygen tension. Historically, these symptoms were misdiagnosed as pneumonia or congestive heart failure. It was not until 1960 that pulmonary edema associated with high altitude was recognized.[3] Clinical features of HAPE are summarized in **Table 1**.[4]

Table 1. Classification of high-altitude pulmonary edema

Severity	Clinical features	Radiographic features
Mild	Dyspnea and tachycardia with exertion; resting heart rate <110	Infiltrate involving less than one-fourth of one lung field
Moderate	Dyspnea, weakness, fatigue with ordinary effort; headache, dry cough; resting tachycardia, 110–120	Infiltrate involving at least half of one lung field
Serious	Dyspnea, headache, weakness, nausea at rest; productive cough; tachycardia, 120–140	Bilateral infiltrates involving at least half of each lung field
Severe	Stupor or coma; inability to stand or walk; severe cyanosis; bubbling rales with copious sputum, usually bloody; tachycardia >140	Bilateral infiltrates involving more than half of each lung field

Used with permission. Modified from Table 1 in: Hultgren HN. High altitude medical problems. *West J Med* 1979; 131:8–23.

The likelihood of developing HAPE is directly related to ascent rate, final altitude, length of stay at altitude, degree of acclimatization, male sex, and individual susceptibility.[5–8] HAPE incidence ranges from less than 0.01%-0.1% in skiers in Colorado (elevation 2,743 m to 3,354 m)[8,9] to 15.5% in soldiers in the mountains of India (elevation 4,500 m).[10] Individuals who have previously developed HAPE appear especially susceptible. Recurrence rates as high as 60%[11] and 66%[10] have been reported. High-altitude natives who re-ascend after spending time at sea level are also at risk.[7,12]

Pathophysiology

Continuing investigations have improved our understanding of HAPE causes. Multiple pathologic mechanisms have been implicated. The primary insult is hypoxia. At elevations of 1,524 m (5,000 ft) an individual's arterial partial pressure of oxygen (PaO_2) ranges from 75 to 81 mm Hg; at 2,286 m (7,500 ft), from 69 to 74 mm Hg; and at 4,572 m (15,000 ft), from 48 to 53 mm Hg.[7] Diminished oxygen tension is associated with pulmonary arteriolar vasoconstriction and increased pulmonary artery pressure.[4,13] Subsequent regional perfusion imbalances (i.e., hyperperfusion of areas without arterioles and increase flux of fluid into alveoli) contribute to pulmonary dysfunction.[14] Also implicated is some element of increased endothelial barrier permeability.[13,15] Analyses of bronchoalveolar lavage from HAPE victims demonstrated a high protein content and the presence of inflammatory cells, specifically alveolar macrophages, in the edema fluid.[16,17] Parallels have been drawn between HAPE and adult respiratory distress syndrome (ARDS). Both appear to be noncardiogenic, permeability-leak pulmonary edemas.[15,18]

Other factors contribute to pulmonary derangements associated with HAPE. These include a diminished hypoxic ventilatory drive,[13,15,19–21] inappropriate ADH (antidiuretic hormone) secretion, increased aldosterone, increased atrial natriuretic factor,[22] and coagulation defects.[23–26]

Prevention

HAPE prevention is best accomplished by slow, gradual ascent to allow for acclimatization. For example, when sleeping at elevations above 3,000 m, one should not gain more than 300 m in altitude per day.[27] The same medications that are effective in acute mountain sickness (AMS) prevention may lessen the risk of developing HAPE. Administration of acetazolamide[28–31] and dexamethasone[30,32–34] have been helpful in preventing AMS symptoms.

Treatment

The cornerstones of therapy for HAPE are descent to lower elevation and supplemental oxygen. With evacuation to lower altitude, symptoms usually improve rapidly; however, even with treatment, mortality may still be as high as 11%.[35] Without intervention, 40%–50% of victims may succumb.[35] Resolution of mild HAPE with bed rest alone has been reported.[36] Continu-

ous positive airway pressure masks improve oxygenation and ventilation-perfusion mismatches in some HAPE patients.[37,38] Furosemide and other diuretics have been used in the treatment of HAPE.[10] Therapy with furosemide, however, may be risky in a high-altitude wilderness setting where the patient may be dehydrated. The Gamow bag (a portable hyperbaric chamber), postural drainage, and warming are other treatment modalities that have been reported.[39,40] All these therapies are advocated only as temporizing measures to be used while waiting for evacuation or to allow the patient to improve enough to descend.

Calcium channel antagonists

In the past few years, several researchers have looked at the effectiveness of calcium channel antagonists in HAPE prevention and treatment. The vasodilating effects of calcium channel antagonists have been useful in improving the hemodynamics of primary pulmonary hypertension and chronic hypoxic conditions such as chronic obstructive lung disease.[41,42] It seems reasonable that calcium channel antagonists should also attenuate the pressor response to acute hypoxia and, to the extent that pulmonary hypertension contributes to HAPE, improve its symptoms. When administered to laboratory animals subjected to acute hypoxia, nifedipine and verapamil prevented increases in pulmonary artery pressures and total pulmonary resistance.[41,43,44] Stanbrook[41] further demonstrated that nifedipine also reverses hypoxic pulmonary hypertension. In addition to improving pulmonary hemodynamics, Reeves and Schoene[18] note that calcium antagonists diminish the inflammatory response by interrupting activation of calcium-dependent phospholipase A2.

Because HAPE is potentially lethal, and since descent is the safest and most effective treatment, it is difficult to conduct controlled clinical studies with large numbers of patients with severe symptoms.[45,46] In 1989, Oelz et al[45] reported the effects of nifedipine on HAPE patients in the Alps. The six subjects were mountaineers who fulfilled these entry criteria: ascent from 490 m to 4,559 m within 24 hours; symptoms of acute mountain sickness; alveolar-arterial oxygen gradient greater than 10 torrs; and radiographic evidence of pulmonary edema. Subjects were given nifedipine 10 mg sublingually. This dose was repeated after 15 minutes if systolic blood pressure did not drop by 10 mmHg. Additionally, study participants received nifedipine 20 mg orally every six hours. Control patients ascended at the same rate but did not meet the other entry criteria.

During the study, subjects continued active climbing without supplemental oxygen. Blood gas samples, Doppler echocardiograms, and chest radiographs demonstrated that, compared with controls, HAPE patients had significantly higher pulmonary artery pressures; lower arterial PO_2 and oxygen saturation; and increased alveolar-arterial oxygen gradients.[45,47] All subjects who received nifedipine reported improvement in clinical symptoms within 15–30 minutes, and relief of shortness of breath or chest pressure by one hour. After nifedipine therapy, pulmonary artery pressures dropped and remained in a range similar to that of controls, oxygenation improved, and the alveolar-arterial oxygen gradient decreased. Chest radiographs demonstrated progressive clearing of alveolar or interstitial edema in all six HAPE patients.

The authors theorized that reduced pulmonary shunting accounted for the rapid relief of symptoms, and that lowering of pulmonary artery pressure decreased fluid movement from the vascular space and subsequent edema formation. Headache was the only adverse side effect attributed to nifedipine. Some of nifedipine's other known side effects include hypotension, flushing, dizziness, nausea, vomiting, muscle cramps, peripheral edema, and palpitations.[18,48]

Bartsch et al[49] reported a double-blinded, placebo-controlled prospective trial using nifedipine for HAPE prophylaxis. Twenty-one mountaineers with previous HAPE episodes documented by x-ray received nifedipine or placebo beginning three days prior to ascent. Study subjects received 20 mg of slow-release nifedipine on the third and second days prior to ascent. The drug was administered twice the day before ascent, and then three times daily beginning the day of the climb. The climb was from 1,130 m to 4,559 m over a 22- hour period. At high altitude, subjects continued mountaineering activities. Radiographs, echocardiograms, arterial blood gases, and clinical exams were performed for four days after ascent. Eight normal men without HAPE histories who were considered nonsusceptible to HAPE, and who were at the camp for a different study, also underwent exams.

Differences between control and nifedipine groups were significant. Seven of 11 subjects who received placebo developed HAPE. Six of these people terminated their participation in the study by the third day at 4,559 m because of symptoms. Only 1 of 10 subjects who received nifedipine developed HAPE ($p=.01$). This one mountaineer in the nifedipine group felt well enough to continue full activities at altitude. The group receiving nifedipine also demonstrated fewer altitude illness symptoms, higher oxygen saturation, decreased alveolar-arterial oxygen difference, and significantly lower pulmonary artery pressures than the placebo group. Pulmonary artery pressures in treated subjects were close to those of subjects considered nonsusceptible to HAPE. The authors concluded that nifedipine successfully prevented HAPE in subjects susceptible to high-altitude pulmonary edema. The authors warn, however, that long-term and widespread nifedipine use for mountaineering is unstudied and potentially dangerous. The improved pulmonary parameters in the nifedipine group were presented as evidence that nifedipine acts by attenuating the pulmonary vascular response to hypoxia and preserving gas exchange.

Alpha and beta-adrenergic antagonists

In a recent abstract, Hackett and associates[50] reported on the role played by sympathetic blockade in pulmonary hypertension associated with HAPE. They documented changes in pulmonary artery pressure (PA pressure) in response to intravenous administration of an alpha-adrenergic antagonist (phentolamine) and a beta-adrenergic antagonist (esmolol). PA pressure measurements were made on the six subjects receiving drugs with and without oxygen; and receiving oxygen alone. The data showed that esmolol, with and without oxygen, increased PA pressure from baseline, while phentolamine, with and without oxygen, decreased PA pressure from baseline ($p<.05$). These results suggest that elevated alpha sympathetic activity may contribute to HAPE development.

Conclusion

Recent studies provide evidence to support the key role of pulmonary hypertension in HAPE etiology. Nifedipine prevents and reverses this response to hypoxia. Thus, nifedipine is a reasonable prophylactic agent for patients with demonstrated HAPE susceptibility. Additionally, nifedipine administration to a HAPE victim is a valuable temporizing measure when descent is impossible or must be delayed. Early data suggest that phentolamine reduces PA pressure in HAPE patients. Whether this alpha-blocker will be useful in HAPE management will be determined by future investigations.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

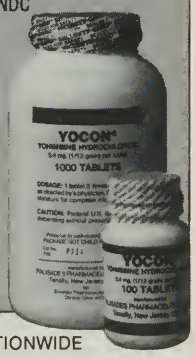
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Cough and cold medicine use in young children: A survey of Maryland pediatricians

Anne M. Gadomski, M.D., M.P.H., and Judith D. Rubin, M.D., M.P.H.

From the University of Maryland School of Medicine where Dr. Gadomski is assistant professor of pediatrics, and Dr. Rubin is associate professor of pediatrics, and of epidemiology and preventive medicine.

ABSTRACT: *Among 307 Maryland pediatricians responding to a mail survey, recommendation or prescription of cough and cold medicines for children under 36 months of age was found to be related to the patient's age, as well as to the physician's year of graduation and type of practice.*

Because children under 5 years of age experience four to nine episodes of upper respiratory infection (URI) per year,[1,2] management of these infections is a frequent issue for parents and physicians. Cough and cold medicines (CCMs) are heavily advertised, commonly found in the household, and widely available with or without prescription. Sample CCMs are frequently provided by pharmaceutical companies for distribution by physicians in clinics, emergency rooms, and private offices. Published controlled trials, however, have demonstrated little efficacy of CCMs in children less than five years old.[3-5] Moreover, there are increasing reports of toxicity in infants and children.[6-12] In view of the lack of demonstrated efficacy and the potential for toxicity, we asked how frequently CCMs are prescribed or recommended by physicians and what prompts physicians to prescribe or recommend CCMs for young children. This report describes the frequency and correlates of recommendation or prescription of CCMs for young children as determined by a survey of pediatricians in Maryland.

Methods

Pediatricians on the mailing list of the Maryland Chapter of the American Academy of Pediatrics received a one-page questionnaire as an insert in the chapter's February 1992 newsletter, stating that the University of Maryland Schools of Pharmacy and Medicine were gathering information about URI treatment in young children.

The questionnaire began with the following scenario: "A 12-month-old child is brought to your office with coryza and cough of three days duration. Your assessment is an upper respiratory infection without other associated

diagnoses such as otitis media." Respondents were asked to indicate how often they employed the management options listed in **Table 1**. Respondents were also asked how often they recommended or prescribed CCMs for different age groups, child symptoms, or parental characteristics listed on the questionnaire. Respondents could choose one of four options (usually, sometimes, seldom, or never) to indicate frequency for each questionnaire item. Finally, respondents were asked to indicate what specific cough and cold ingredients they usually recommended for children under 2 years of age. Practice type, location, and year of medical school graduation, but no other identifying information, were included on the questionnaire. A second mailing was not attempted. Results were entered in dBASE 4.0, a database software program, and analyzed using SPSS 4.1, a statistical data analysis software program.

Table 1. Management options chosen by responding pediatricians (%) for a 12-month-old with an uncomplicated common cold (N= 307)*

	Usually	Sometimes	Seldom	Never
Explain what causes colds	84	12	2	0
Vaporizer	56	33	8	1
Saline nose drops	36	45	15	3
Bulb syringe	30	40	18	8
Increase fluids	59	26	10	2
Acetaminophen	25	49	18	8
Over-the-counter CCM	13	47	28	11
Prescribed CCM	2	16	44	35

Due to incomplete responses across each management option, the sum of the response percentages does not always equal 100%.

Results

Of 979 mailed questionnaires, 329 (34%) were returned. Twenty-two (7%) respondents were retired, inactive, or in administrative or research positions, leaving 307 questionnaires for analysis. Respondents included 31% in group practices, 21% in hospital practice, 21% in academic practice, 14% in solo practice, and 11% in health maintenance organizations (HMOs); 2% did not indicate practice type. Forty-six percent of the sample had graduated from medical school before 1980. Twenty-seven percent of the practices were located in Baltimore City or Washington, DC; 58% were in suburban counties; and 7% in rural counties. Seven percent did not indicate practice location. Type of practice and year of medical school graduation were correlated ($r = 0.34$, $p < .001$): Recent graduates were more likely than earlier graduates to be in hospital or academic practices (57% vs 23%) as opposed to solo, group, or HMO practices (41% vs 73%).

Regarding management of the 12-month-old with a common cold, most pediatricians indicated that they usually explained what causes colds (**Table 1**). The next most common management strategies were to recommend increased fluid intake and/or use of a vaporizer. Over-the-counter CCMs were "sometimes" recommended by 47% of respondents and "usually" recommended by 13%. Although year of medical school graduation was not significantly correlated with CCM prescription ($r = 0.13$), it was correlated with CCM recommendation ($r = 0.20$, $p < .001$). For example, 73% of physicians who graduated prior to 1980 "usually" or "sometimes" recommended CCMs, compared with 49% of recent graduates (chi-square = 18.7, $p < .001$). Prescribing CCMs was the least commonly reported management strategy, as only 2% of respondents "usually" and 16% "sometimes" prescribed CCMs. Twenty-two percent of physicians who graduated prior to 1980 "usually" or "sometimes" prescribed CCMs, in contrast to 15% of recent graduates (chi-square = 13.1, $p < .01$).

Frequency of reported CCM recommendation increased with the age of the hypothetical patient. Fourteen percent "usually" or "sometimes" recommended CCM use for infants under 6 months of age, whereas 86% "seldom" (32%) or "never" (55%) recommended CCM use in this age group. For children 13 months to 24 months of age, 61% of respondents indicated that they "usually" or "sometimes" recommended CCMs, compared with 39% who "seldom" (26%) or "never" (13%) did. For children over 36 months, 80% "usually" or "sometimes" recommended CCMs, whereas 20% "seldom" or "never" recommended CCMs.

Reasons given by respondents who "usually" or "sometimes" recommended or prescribed CCMs for young children are presented in **Table 2**. "Difficulty sleeping" was the most common child-related reason for advising CCM use. The most common parent-related reasons reported for CCM use were that the parent was kept awake, or requested or insisted on a CCM.

For children under two years of age, 58% of respondents reported using combination CCMs. Of these, 58% preferred specific brands, naming a total of 30 brands. Type of clinical practice was associated with choice of CCM ingredients. Pediatricians in solo (63%), group (79%), or HMO (64%) practices indicated more frequent use of combination CCMs than those in hospital (50%) or academic (40%) practices (chi-square = 26.6, $p < .0001$). The most common single ingredient recommended was decongestant, indicated by 57% of respon-

Table 2. Reasons reported by Maryland pediatricians (%) for "usually" or "sometimes" recommending or prescribing CCM for young children (N= 307)

	Recommend	Prescribe
Child has nasal congestion	48%	27%
Child has cough	57	39
Child has difficulty sleeping	62	42
Parent is kept awake	53	36
Parent requests prescription	56	30
Parent insists on prescription	56	33
Parent has insurance coverage for drugs	*	19
Parent has Medicaid	*	20

* Not asked

dents, of whom 62% stated a brand preference. The next most common single ingredients were dextromethorphan (36%) and antihistamines (25%). Phenergan and codeine were advocated for children under two years of age by only a few pediatricians (3% and 5%, respectively). There was no correlation between year of medical school graduation and frequency of recommendation of either combination or single-ingredient CCMs.

Discussion

While the reportedly low rate of CCM use in infants under 6 months of age is reassuring, the high frequency of use of these medicines in 1- to 3-year-olds is surprising given the lack of demonstrated efficacy of CCMs in young children. The most frequent symptoms prompting CCM use—child's difficulty sleeping or cough—are not substantiated by clinical trials. Furthermore, CCMs cannot be considered innocuous placebos[13] due to potential adverse side effects.

In this group of physicians, recent medical school graduates were less likely than earlier graduates to report reliance on pharmaceutical strategies to manage uncomplicated URIs in young children. Reasons for this difference cannot be determined from this survey, but may be due to increased awareness of the lack of demonstrated efficacy as well as the potential toxicity of these products in children. Another possible reason is that younger physicians were more likely to be in academic or hospital settings, where in subspecially practices they may be less likely to treat children with URIs and where they also may be relatively isolated from CCM marketing by pharmaceutical representatives.

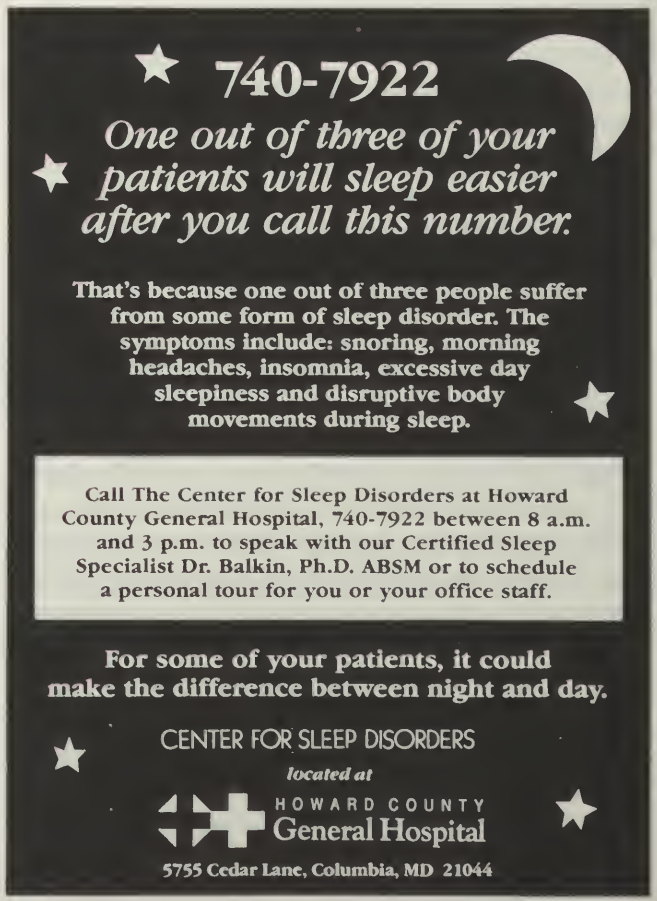
Because of the relatively low response rate and the fact that the survey was limited to physicians in a single state, the results may not be representative of all pediatricians. Furthermore, although in the United States approximately one-third of medical encounters by patients under age 4 are with physicians other than pediatricians,[14] this survey did not include family or general practitioners. Because prescribing habits may vary by specialty, our data do not identify the entire spectrum of CCM recommendation or prescription for young children. Results are also limited by self-report; however, the survey was anonymous to promote more candid responses. A better way to evaluate prescribing practices would be exit interviews or direct observation. Lastly, the effect of drug promotion efforts on physician-prescribing behavior has been well described[15-17] and may be an important determinant of CCM use that could not be evaluated by the methods used in this survey.[18]

Parental expectations, attitudes, and beliefs appear to influence pediatrician recommendation or prescription of CCMs for young children. The most difficult part of common cold management may be dealing with parents who insist on CCM treatment of symptoms. Socioeconomic factors, educational level, perception of a child's susceptibility to illness, and beliefs regarding efficacy of over-the-counter medications are important parental determinants of drug use in children.[19] Parents are regularly exposed to CCM promotion through advertising, and their insistence or request for CCMs may be an indirect measure of the effect of direct-to-consumer advertising by drug companies.[20]

On the other hand, parental pressure regarding CCMs may be secondary to fatigue, as suggested by this survey, or simply by the desire to do something for the child. Signs of URI, particularly cough, frequently worry or annoy parents, even if the signs do not endanger the child. These symptoms become the focus of attention and may lead to the use of adult medicines or increasing dosages to obtain symptomatic relief without regard to the potential harmful effects of certain remedies.[21]

Existing literature on prescribing behavior describes considerable resistance among physicians to send patients home empty-handed.[22-24] Physicians' need to "do something medical" and patients' expectations are strong motivations for "nonscientific drug prescribing."[18,23] Three-quarters of nonscientific drug prescribing by general practice physicians may be explained by patient demand and invocation of the placebo effect.[23] The pediatric analogue to bending to patient demand or preference may be bending to parental pressure, although the effect of parental pressure on physician prescribing practices has not been well documented.

Changing these views and practices will be difficult if clinicians believe parents are unhappy unless medications are prescribed. For parents, carefully formulated health education messages, delivered within the context of acute visits for URI,



can lead to safe and satisfactory management of a child's cold at home without the risk or expense associated with CCM use. Additionally, managed care, and hospital and clinic drug formularies can be modified to remove potentially dangerous combination products. Pending further research to provide definitive data on CCM efficacy, continuing medical education to counter CCM promotion efforts or "academically based unadvertisements" [18] will be necessary to rationalize management of the common cold.

Pathogenesis and therapy of pulmonary emphysema

Prashant Kumar Rohatgi, M.D., and Truvor Vadym Kuzmowych, M.D.

ABSTRACT: *Emphysema is characterized by permanent enlargement of the respiratory air spaces distal to the terminal bronchioles accompanied by destruction of their walls and without obvious fibrosis. We present a review of this disease, discussing its classification, pathology, and therapy.*

Dr. Rohatgi is associate chief, Pulmonary Section, Veterans Affairs Medical Center, and associate professor of medicine, George Washington University Medical Center. Dr. Kuzmowych is chief, Pulmonary Clinic, Veterans Affairs Medical Center, and associate professor of medicine, George Washington University Medical Center.

The word "emphysema" is derived from the Greek words *en* 'in' and *physema* 'a blowing'. It was originally applied by Blagden to describe a case of postpartum subcutaneous emphysema.[1] Over the years, the word evolved to mean "a condition of the lung characterized by permanent enlargement of the respiratory air spaces distal to the terminal bronchioles accompanied by destruction of their walls and without obvious fibrosis."[2]

Classification of emphysema

Although emphysema is defined in terms of lung structure alterations, it is classified according to the lung acinus location that is predominantly affected by these pathologic changes. The acinus is that part of the lung distal to a terminal bronchiole. The terminal bronchiole is the last generation of noncartilaginous, purely conductive airways. Each acinus consists of respiratory bronchioles, alveolar ducts, alveolar sacs, and alveoli.

Localization of emphysema in the acinus is easiest when the disease is relatively mild. It is best appreciated by inspecting the cut surface of an inflation-fixed lung with a magnifying glass or by examining paper-mounted thin slices of inflation-fixed lungs as described by Gough.[3]

Centriacinar emphysema. Centriacinar (centrilobular) emphysema is characterized by respiratory bronchiole destruction and development of dilated air spaces in central portions of the pulmonary acinus. This form is dominant in cigarette smokers and invariably associated with the collection of inflammatory cells in respiratory bronchioles, particularly pigmented

alveolar macrophages. Centriacinar emphysema lesions are more common and severe in upper regions of affected lungs. Dilatation and destruction of respiratory bronchioles, mimicking centriacinar emphysema, has been described in simple coal workers' pneumoconiosis.

Panacinar emphysema. In panacinar (panlobular) emphysema, the entire acinus is uniformly involved in the destructive process. Panacinar emphysema tends to localize in the lung bases, predominating in lower lung zones. It is most common in the genetic form of emphysema due to the homozygous deficiency of the alpha$_1$protease inhibitor, alpha$_1$-antitrypsin (A_1AT). Panacinar emphysema-like changes have also been observed in advanced centriacinar emphysema in cigarette smokers with normal A_1AT levels.

Distal acinar emphysema. Distal acinar (paraseptal) emphysema is characterized by destruction of alveolar ducts and sacs. This results in formation of blebs, or bullae, adjacent to interlobular septa or abutting the pleura. Such bullae are generally seen in upper zones of the lungs. Rupture of these bullae is responsible for episodes of simple spontaneous pneumothoraces in young adults, especially tall, thin individuals. In contrast to centriacinar or panacinar emphysema, this form of emphysema is generally focal and does not result in airway obstruction until late in the disease course.

Normal anatomy and pathology

The lungs' connective tissue framework is made up of elastin and collagen fibers embedded in an amorphous substance consisting principally of proteoglycans. Connective tissue fibers exist as a continuum throughout the lung. Conceptually, however, the connective tissue fiber arrangement in the lung is divided into three compartments. The first is the relatively fixed, axial connective tissue compartment, which surrounds bronchi, bronchial and pulmonary arteries, and the associated deep lymphatic plexus. The second is the peripheral connective tissue compartment, which includes connective tissue in the visceral pleura and its extensions into the lung parenchyma by way of interlobar and interlobular fissures and septa. Pulmonary veins and superficial lymphatic plexus run through these septa, which ultimately divide the lung into pulmonary lobules. The third compartment is parenchymatous connective tissue that connects the axial and peripheral fiber systems, providing a framework for all structures within the acinus and primary lobule. This includes the fiber skeletons of respiratory bronchioles; pores of Kohn; interalveolar fenestrations; and alveolar ducts, sacs, and septa.

Pathologists recognized over a century ago that dilatation of air spaces in emphysema is accompanied by progressive enlargement of fenestrations within alveolar septa, ultimately leading to disruption of the septa and capillary network within. In 1876, Epinger first brought attention to the disruption of elastic fibers within the lungs of emphysema patients. Orsos, however, was first to suggest rupture of elastic fibers as the initial lesion in emphysema.[1]

Physiology

The major physiologic lung abnormalities in emphysema patients are loss of elastic recoil, decreased surface area for gas exchange, and limited airflow. Unfortunately, *in vivo* measurement of these physiologic parameters is not sensitive enough to detect mild degrees of emphysema. Increased pulmonary compliance, or loss of elastic recoil, is believed to be due to destruction of elastin fibers in lung parenchyma. Lung compliance is increased in patients with moderate to severe emphysema, but there is weak correlation between changes in lung compliance and severity of emphysema as assessed by morphologic examination of whole lungs.

Destruction of alveolar septa in emphysema results in decreased surface area for gas exchange, reducing the lungs' diffusing capacity. Of all pulmonary physiologic parameters, reduction in diffusing capacity correlates best with emphysema severity. It is important to recognize, however, that normal diffusing capacity does not exclude a diagnosis of emphysema. Airflow limitation in emphysema is due to loss of radial traction on small airways by connective tissue fibers or airway inflammation. Recent findings suggest airflow limitation in centriacinar emphysema is due primarily to airway abnormalities, with loss of radial traction playing an additive role. In panacinar emphysema, on the other hand, airflow limitation is due mainly to the loss of elastic recoil.[4] Generally, measurement of airflow obstruction and lung volume is not helpful in differentiating emphysema from other diseases that produce chronic airflow limitation.[5]

Chemistry

Desmosine and isodesmosine are two tetrafunctional, cross-linking amino acids unique to elastin. Measurement of desmosine and isodesmosine in lung parenchyma devoid of pleura, large airways, and blood vessels has been used to assess elastin content of lungs.[6] Results were expressed as a percentage of total lung parenchymal connective tissue, and showed that the proportion of elastin is reduced in emphysematous human lungs compared with normal controls. Whether elastin degradation products are elevated in blood or urine of emphysema patients remains unsettled at present, primarily because of problems with assay methods used to detect these elastin-derived peptides.

Pathogenesis

To date, pathologic, physiologic, and biochemical data suggest that the underlying process leading to emphysema development is the fraying and rupture of elastin fibers

within alveolar walls. Several concepts and theories explaining the basic mechanism for this process have evolved over the past century. They range from the "mechanical wear and tear" theory of emphysema originally proposed by Laennec, to the present concept of a biochemical "protease-antiprotease" imbalance.

In 1963-1964, Laurell and Eriksson made a seminal observation associating deficiency of an alpha-$_1$globulin peak of serum protein electrophoresis with obstructive lung disease[7] and a familial form of emphysema.[8] In the initial report, they described five patients with an absent alpha-$_1$globulin peak on serum protein electrophoresis. Three had obstructive lung disease.[7] Laurell and Eriksson also demonstrated that the absent peak on serum protein electrophoresis was associated with the deficiency of a glycoprotein with antitrypsin activity.[7] In his second paper, Eriksson[8] described a family with three siblings who had emphysema, A_1AT deficiency, and markedly diminished trypsin-inhibitory capacity. These observations strongly supported the hypothesis that genetic factors are important in emphysema pathogenesis.

The true biologic significance of A_1AT deficiency in emphysema pathogenesis became more evident when Gross[9] described emphysema development in rats after tracheal instillation of papain, a proteolytic enzyme. Based on this discovery, the "protease-antiprotease theory of emphysema" came into being. It was modified to the "elastase-antielastase theory of emphysema" after it was recognized that experimental emphysema produced by tracheal instillation of proteases occurred only if the proteases had elastolytic activity.[10,11] The elastase-antielastase theory postulates that elastin fibers in the alveolar septa are constantly exposed to endogenous elastases, but are protected from these proteolytic enzymes by antielastases in the interstitial fluid bathing the elastin fibers. Antielastase deficiency or elastase excess disrupts the balance and destroys elastin.

Endogenous elastases

Potential sources of elastases capable of interacting with alveolar septal connective tissue include distal organs, such as pancreas; circulating elements, such as platelets, neutrophils, and monocytes; intra-alveolar cells, such as macrophages; and mesenchymal cells, such as fibroblasts and smooth muscle cells in the alveolar interstitium. Pancreatic elastases are detectable in blood only with pancreatitis and do not have a role in emphysema pathogenesis. Little is known about elastases produced by mesenchymal cells in the pulmonary interstitium, and the significance of these enzymes in emphysema pathogenesis is poorly understood. The role platelet elastase has in emphysema pathogenesis is unknown. Alveolar macrophages, circulating neutrophils, and, to a lesser extent, monocytes are believed to be major sources of elastases responsible for disintegrating elastin and causing pulmonary emphysema.

Neutrophils. Neutrophils are rich in the amount and variety of proteases present in their cytoplasmic granules. Only three of the proteases have the capacity to degrade lung elastin. They are stored as intracytoplasmic azurophilic granules and are released during phagocytosis or when the neutrophils die and disintegrate.

Neutrophil elastase is a glycoprotein most active at neutral or slightly alkaline pH. It has serine at the active site and is, therefore, classified as a serine protease. Neutrophil elastase not only disintegrates elastin as its name implies, but also attacks connective tissue components such as proteoglycans, type III and type IV collagen, and fibronectin. Neutrophil elastase also destroys components of the clotting cascade, immunoglobulins, and kinins.

Important observations supporting the putative role of neutrophil elastase in emphysema pathogenesis are as follows: tracheal instillation of purified human neutrophil elastase in animals results in pulmonary emphysema;[12] neutrophil elastase can be immunocytochemically localized to elastin fibers in smokers' lungs; and elastase-elastin complexes can be demonstrated in areas of lung destruction in emphysema patients.[13]

Cathepsin G is a neutral endopeptidase with elastolytic properties. It is 10 times less potent than neutrophil elastase.

Proteinase 3 is the most recently discovered neutral protease with elastolytic properties. As with neutrophil elastase, tracheal instillation of proteinase 3 reportedly produces emphysema in hamsters.

Monocytes. Circulating monocytes are precursor cells of mononuclear phagocytes, including alveolar macrophages. They produce serine elastase that is closely related in physiochemical properties and antigenic behavior to neutrophil serine elastase. Unlike neutrophil serine elastase, which is stored in intracytoplasmic azurophilic granules, monocyte serine elastase is localized on the plasma membrane surface. It can readily damage connective tissue as the cells travel from the circulation into tissues. The amount of elastase per monocyte is approximately 3% of that found in neutrophils. Monocytes lose the ability to produce serine elastase as they transform into tissue macrophages.

Alveolar macrophages. The elastin-degrading enzyme system of human alveolar macrophages is quite complex. Metalloelastases and elastolytic cathepsins can be synthesized and secreted by activated alveolar macrophages. These cells are also capable of receptor-mediated binding, uptake, and release of neutrophil elastase and other elastolytic enzymes.[14] The elastolytic capacity of activated alveolar macrophages in cigarette smokers has been studied extensively. Bronchoalveolar lavage fluid, and homogenates, lysosomal extracts, and even culture-medium bathing cell cultures of alveolar macrophages from cigarette smokers all demonstrate elastolytic activity. Which alveolar macrophage elastase is responsible for the

majority of this elastolytic activity remains unknown.

Metalloelastase is a metalloenzyme with a zinc atom at the active site. It is synthesized and secreted by activated alveolar macrophages.[14] Unfortunately, sufficient quantities of purified metalloelastase to perform *in vivo* studies cannot be recovered from human or animal alveolar macrophages.

Cathepsins are endopeptidases that react with proteins at a neutral (cathepsins G and L) or acid (cathepsins A through E) pH. They usually occur in lysosomes and are intracellularly active. Cathepsin G, found in neutrophils, has been discussed. Human alveolar macrophages have cathepsins B, D, and L, but only B and L have elastolytic activity.

Cathepsin B is a lysosomal cysteine proteinase that degrades several connective tissue components, including elastin, collagen, and proteoglycans. Cathepsin B levels have been reported three times higher in alveolar macrophages from healthy cigarette smokers compared with nonsmokers, and approximately 10 times higher in bronchoalveolar lavage fluid (BALF) from smokers compared with BALF from nonsmokers. Tracheal instillation of cathepsin B from bovine spleen into hamsters has been reported to produce emphysema.[15]

Cathepsin L is a lysosomal cysteine proteinase that is also a potent elastase. Analyses of BALF from smokers and nonsmokers have demonstrated detectable cathepsin L antigen in the fluid, with smokers having more than twice as much as nonsmokers. The enzymatic activity of cathepsin L, however, was equivalent in lysates of alveolar macrophages from the two groups.[16]

Several indirect studies have shown that the elastin destruction by human alveolar macrophages may be a rather complex process. The process requires cooperative interaction among different elastases in alveolar macrophages. It also requires a substrate modifying factor, such as plasminogen activator, normally found on the surface of activated alveolar macrophages.[17] In addition, it requires the exclusion of elastase inhibitors, such as cystatin C and the tissue inhibitor of metalloproteases (TIMP), endogenously produced by alveolar macrophages.

Endogenous antielastases

A complex system of antielastases counteracts potential damage by endogenous elastases to lung connective tissue, especially elastin. This complex defense system, for the purpose of simplicity, can be divided into circulating or serum antielastases, antielastases made in the lung, and antielastases generated by elastase-producing cells in the lung.

Circulating or serum antielastases. The alpha globulin fraction of human plasma proteins contains several glycoproteins categorized as proteinase inhibitors. They comprise approximately 10% of total plasma proteins, and each is capable of inhibiting a spectrum of proteolytic enzymes. The most abundant of these plasma proteinase inhibitors are A_1AT and alpha$_2$-macroglobulin (A_2MG). They are also the only two proteinase inhibitors that can inhibit elastases.

A_1AT is a small glycoprotein with a molecular weight of 51,000 and serum concentration of 290±45 mg/100 ml.[18] The molecule consists of one 394-amino-acid polypeptide chain combined with three carbohydrate chains. A_1AT belongs to the serpin family of proteins and is a serine protease inhibitor. It has a single reactive site containing methionine at position 358. A_1AT reacts with serine proteases as a false substrate and blocks the reactive site of the protease by forming an almost irreversible 1:1 bond with it. The protease-antiprotease complexes must subsequently be catabolized.

Because of its small size, the A_1AT molecule can readily diffuse from circulation into the interstitial fluid in the alveolar septa and also in the alveolar epithelial lining fluid (AELF). BALF studies have demonstrated the concentration of A_1AT in AELF to be about 90% that of the serum.

A_1AT inactivates a large number of serine proteases. However, in preventing emphysema, its major target in the lung is the proteases released by activated neutrophils, particularly neutrophil elastase. Kinetic studies of the reaction between A_1AT and its potential substrates found its reaction rate to be fastest with neutrophil elastase. Apparently, A_1AT does not react with metalloelastases or cathepsins produced by alveolar macrophages.

A_2MG, like other antiproteases, has a broad spectrum of inhibition. Of all endogenous elastases in the lung, however, it inhibits only neutrophil elastase in a molar ratio of 1:1.[20] The two sources of A_2MG in the lung are circulating plasma, which contains 260 mg/100 ml, and alveolar macrophages. A_2MG is a large glycoprotein with a molecular weight of 725,000. Unlike A_1AT, it does not diffuse into alveolar interstitial fluid or AELF in significant amounts. Indeed, BALF studies found A_2MG levels in AELF to be 25 times lower than in serum. This suggests A_2MG does not egress from circulation into the lung, and that the *in vivo* level of A_2MG produced by resident alveolar macrophages is quite low. In addition, BALF from patients with homozygous A_1AT deficiency has very low levels of antielastase activity. Removal of A_1AT from BALF of normal individuals results in loss of antielastase activity. These observations suggest A_2MG is a minor defensive player against neutrophil elastase. Molecular concentration of A_2MG in AELF is 200 times smaller than that of A_1AT.

Antielastases produced by the lung. *Antileukoproteinase*, formerly called bronchial mucus inhibitor, is the best characterized antielastase produced in the lung.[20] It has a low molecular weight, acid stable protein of 107 amino acids, and a methionine residue at its active elastase inhibitory site. Unlike A_1AT, antileukoproteinase forms a reversible complex

with neutrophil elastase. Furthermore, antileukoproteinase-neutrophil elastase complex dissociates in the presence of A_1AT, and the neutrophil elastase forms an irreversible complex with A_1AT. Electron immunomicroscopic studies have demonstrated antileukoproteinase attached to elastin fibers in the extracellular matrix of the human lung. Laboratory studies also suggest antileukoproteinase is more effective than A_1AT in neutralizing neutrophil elastase already bound to insoluble elastin.

Antileukoproteinase has been localized by immunoperoxidase staining to the serous cells of mucus glands in the supra- and infra-laryngeal airways and to the secretory granules in nonciliated epithelial cells of small airways, presumably Clara cells. Antileukoproteinase is the major neutrophil elastase inhibitor in bronchial secretions, but its role at the alveolar level is minor. Along with elafin, it represents less than 5% of the total antielastase activity in AELF.

Elafin is also a low molecular weight neutrophil elastase inhibitor. Its presence has been demonstrated in expectorated sputum. Recent studies discovered that elafin is secreted by type II alveolar epithelial and Clara cell lines.[21]

Antielastases generated by elastase-producing cells. Macrophages and neutrophils possess inhibitors of their own elastases. However, only inhibitors produced by alveolar macrophages can be recovered in BALF and have, therefore, been well characterized.

Neutrophil-produced elastase inhibitors. Homogenates of degranulated neutrophils suppress elastase activity in the granular fraction of these cells.[22] The nature of those intracellular inhibitors and their role in preventing emphysema is not well understood. They are believed to be intracytoplasmic and are released only in inflammatory processes characterized by necrosis and autolysis of infiltrated neutrophils.

Macrophage-produced elastase inhibitors. Macrophages produce several proteinase inhibitors. However, only A_2MG, TIMP,[23] and cystatin C are known to inhibit enzymes with elastolytic activity.

Cystatins are a family of proteins that competitively inhibit cathepsins B and L. Cystatin C is the most abundant in human lungs. Monocytes and alveolar macrophages are major sources of lung cystatin C. It is secreted by these cells and can be obtained from AELF by bronchoalveolar lavage.[24]

Pathogenesis of emphysema in A_1AT deficiency

A_1AT is coded by a 12.2 Kb gene located on chromosome 14 at q 31-32.3. It consists of three exons controlling transcription and another four that code for the protein.[19,25] The alleles are codominant, meaning maternal and paternal genes are fully and simultaneously expressed. This gene is expressed primarily in hepatocytes, where it directs synthesis and secretion of A_1AT in plasma. The gene is expressed to a lesser extent in mononuclear phagocytes. The A_1AT glycoprotein is polymorphic. Approximately 75 alleles have been identified based on acid starch gel electrophoresis with isoelectric focusing.

Several alleles are characterized at the gene (nucleotide sequence) and protein (amino acid sequence) levels. Nucleotide and amino acid sequence analyses reveal that most A_1AT variants differ from the normal M family phenotypes, including M1(Ala^{213}), M1(Val^{213}), M2, and M3, because of single nucleotide base mutation and amino acid substitution. Fortunately, most A_1AT variants are immunologically and functionally identical with regard to the spectrum of enzymes inhibited and also have normal serum levels of A_1AT. Pi^P (25% of normal), Pi^S (65% of normal), Pi^W (70% of normal), Pi^Z, Pi^{QO}, $Pi^M{}_{(duarte)}$, and $Pi^M{}_{(malton)}$ are some alleles associated with lower than normal serum levels of A_1AT. Pi^{QO}, also called the null allele, is a variant due to unstable mRNA resulting in no synthesis of A_1AT protein and, therefore, negligible A_1AT serum levels. Pi^Z, $Pi^M{}_{(duarte)}$, and $Pi^M{}_{(malton)}$ alleles are associated with an expression about 15% to 20% of normal. Homozygous expression of the above alleles, such as PiZZ, $PiMM_{(duarte)}$, $PiMM_{(malton)}$, or heterozygous combination of the above alleles, such as $PiZM_{(duarte)}$, $PiZM_{(malton)}$, or PiZQO, is associated with markedly low levels of A_1AT in serum. Heterozygous combination of these deficiency alleles with normal expressing alleles, such as PiZM, result in intermediate deficiency of A_1AT levels in the serum.

The M family of proteinase inhibitor alleles is found in over 95% of the population and is associated with normal A_1AT serum levels. The most common abnormal allele is Pi^Z. This gene is carried by one in 50 to 100 whites. However, homozygous inheritance of Z type allele has a frequency of 1 in 7,000 in a North American population of European extraction. Homozygous PiZZ inheritance is associated with very low levels of A_1AT, generally below 50 mg/100 ml.

In the Pi^Z allele, single base mutation in exon 5 (AAG replaces GAG) results in substitution of lysine for glutamic acid at amino acid position 342. This mutation results in abnormal aggregation and accumulation of A_1AT in rough endoplasmic reticulum of hepatocytes rather than being secreted into the circulation. Not only is the Z type A_1AT molecule associated with low serum levels of A_1AT, but this molecule also takes twice as long as the normal M1-A_1AT molecule to inhibit neutrophil elastase.[26] Evidence also suggests serum from PiZZ homozygous individuals has reduced capability to inactivate chemotactic factors for neutrophils.[27] These observations suggest that the lower respiratory tract in homozygous PiZZ individuals has a markedly reduced antielastase defense against neutrophil elastase because of quantitative and qualitative deficiency of A_1AT in the lung, and may also have an increased elastase burden due to deficient inactivation of neutrophil chemotactic factor. These changes tilt the elastase-antielastase

balance in favor of the elastases, leading to disintegration of elastin and other connective tissue proteins in the interstitial framework of the lung parenchyma ultimately causing panacinar emphysema. Smoking accelerates emphysema development in homozygous PiZZ individuals by mechanisms discussed below.

Emphysema pathogenesis in cigarette smokers

There is a strong association between cigarette smoking and development of chronic bronchitis and centriacinar emphysema. Current concepts about centriacinar emphysema pathogenesis suggest cigarette smoking causes destruction of the elastin network in the alveolar septa and inhibits elastin repair by interfering with elastin synthesis in the lungs. According to the elastase-antielastase hypothesis, smoking affects alveolar elastin destruction by increasing the lung's elastase burden and decreasing the protective effect of antielastases in the lung.[28]

Cigarette smoking's effect on elastase burden. Cigarette smokers have elevated peripheral blood leucocyte counts and increased numbers of neutrophils in BALF compared with nonsmokers.[29] They also have increased alveolar macrophages in BALF. Histologic examination of smokers' lungs shows increased macrophages in and around respiratory bronchioles.

This increase in the alveolar pool of neutrophils and macrophages (elastase vector cells) is believed to be due to migration of neutrophils and monocytes, the precursors of alveolar macrophages, from circulation into the lungs, under the influence of one or more chemotactic factors. *In vitro* studies with nicotine, a major component of cigarettes, have demonstrated it as a direct chemoattractant for neutrophils. However, this occurs only at very high nicotine concentrations and probably has no significant role in neutrophil recruitment into the lung. *In vitro* studies have also shown that an aqueous solution of whole cigarette smoke can activate the alternate complement pathway by modifying the third component of complement. *In vivo*, such a reaction can cause generation of complement factor C5a, one of the most potent chemotactic factors for neutrophils and monocytes.[30] In physiologic concentrations, nicotine also enhances C5a neutrophil chemotaxis. Cigarette smoke interacts with pulmonary alveolar macrophages, inducing them to produce neutrophil chemotactic factors, such as leukotriene B4, and low molecular weight peptides unrelated to complement. These factors also enhance neutrophil degranulation. Furthermore, peptides released during proteolytic degradation of elastin, collagen, and fibronectin have potent chemotactic activity for elastase vector cells, perpetuating the vicious cycle of recruitment and destruction.

Comparative analysis of BALF from smokers and nonsmokers shows a larger alveolar pool of elastase vector cells and increased elastase activity in AELF of smokers. Inhibition studies and immunological studies on BALF from smokers have demonstrated that, in addition to increased neutrophil elastase activity, there is increased alveolar macrophage elastase activity. This is due to metalloproteases, cysteinyl proteases such as cathepsin B and L, and type IV collagenase with elastolytic activity.[15,17,31] Immunolocalization studies of cigarette smokers' lungs have also demonstrated neutrophil elastase bound to elastin fibers within alveolar septa. The above studies provide evidence that cigarette smoking not only increases the number of elastase-containing cells in the lung, but also enhances the production and release of elastases into the lung by these cells.

Cigarette smoking's effect on antielastase protection. In cigarette smokers, there is a good correlation between serum levels of antielastases measured by immunologic assays and those measured by functional assays. Determination of specific antielastases, such as A_1AT, in BALF from smokers reveals the level of A_1AT is normal when measured by immunologic assay methods but markedly reduced when measured by functional assay, such as determination of neutrophil antielastase activity. These findings suggest smokers have normal levels of A_1AT molecules in the AELF, but the molecules are functionally incompetent.

Oxidation of methionine residues of A_1AT in cigarette smokers' lungs renders that molecule functionally inactive.[32] Oxidation of methionine^{358} in the protruding active site of A_1AT to methionine sulfoxide changes that molecule's configuration. This prevents A_1AT from fitting readily into the specificity pocket of neutrophil elastase and decreases its affinity for that molecule by a factor of 2,000. When an oxidized A_1AT molecule combines with neutrophil elastase, it forms an unstable complex. There is also *in vitro* evidence that the methionine residue at the active antielastase site of antileukoproteinase (bronchial mucus inhibitor) is similarly susceptible to oxidative inactivation by cigarette smoke condensate or other oxidants.

There are at least two potential sources of oxidants in smokers' lungs: cigarette smoke itself and inflammatory cells activated by cigarette smoke.[33-35] The gaseous phase of cigarette smoke is rich in free-oxygen radicals such as superoxide, peroxide, and hydroxyl radicals, and the particulate fraction is rich in polymer phenoxy radicals. Cigarette smoke–activated inflammatory cells, such as neutrophils, monocytes, and macrophages, also generate reactive oxygen species and other derivative-free radicals, such as hypochlorous acid and iodide. If these free radicals and reactive oxygen species are not promptly removed by endogenous antioxidants, they can react with methionine and cause the oxidative inactivation of methionine-containing antielastases in the lung. Recent studies suggest some components of endogenous antioxidants, such as ceruloplasmin and methionine sulfoxide reductase, may also be adversely affected by cigarette smoke.

Cigarette smoking's effect on lung elastin synthesis and repair. After an elastolytic injury, the lung attempts to repair itself by laying down new elastin. *In vivo* studies have shown that, following elastase-induced lung injury, there is reduced incorporation of radio-labeled lysine into newly synthesized desmosine in hamsters exposed chronically to cigarette smoke. Elastin is formed by covalent desmosine and isodesmosine cross-links between two tropoelastin polypeptide chains. The cross-links are formed by the lysyl-oxidase-catalyzed oxidation of the epsilon amino group of lysine residues in tropoelastin. Water-soluble components of the gas phase of filtered cigarette smoke inhibit the binding of lysyl oxidase to tropoelastin, preventing formation of desmosine and subsequent cross-linking of tropoelastin to form elastin.[36]

In summary, cigarette smoking damages lung elastin by increasing the elastase burden and creating a functional antielastase deficiency in the lung, and perpetuates the damage by inhibiting repair and neosynthesis of mature elastin.

Emphysema therapy

Based on current concepts about emphysema pathogenesis, management of patients with emphysema can be divided into nonspecific measures and specific therapy.

Nonspecific measures. Goals of nonspecific measures for emphysema are to prevent disease progression, treat potentially reversible disease components, prevent disease exacerbation, and actively involve patients in disease management through lifestyle changes. These goals can be achieved using modalities listed in the therapeutic algorithm in **Figure 1**, irrespective of whether the emphysema is due to genetic deficiency of A_1AT or is related to cigarette smoking. The measures listed also apply to therapy for chronic bronchitis, which frequently coexists in the same patient and is included under the diagnosis of chronic obstructive pulmonary disease (COPD). Nonspecific measures in COPD therapy have been discussed in several recent reviews, including a statement by the American Thoracic Society.[37] It is important to recognize that all therapeutic modalities listed in the algorithm, except cessation of cigarette smoking, treat disease consequences and not underlying pathogenic mechanisms. Whether regular use of bronchodilators influences disease progression is not known, but their role, especially that of ipratropium bromide, is currently being evaluated in a large multicenter clinical trial.

Specific therapy. The ultimate aim of specific therapy in emphysema is to prevent disease progression. According to current understanding of emphysema pathogenesis, a rational approach to specific therapy is to decrease elastase burden and increase antielastase protection in the lung. One intervention that accomplishes both goals is smoking cessation, and it is crucial the patient stops smoking before embarking on other forms of expensive or experimental therapies.

Attempts to augment antielastase protection in lungs of emphysema patients have been confined, and properly so, to patients with a genetic form of emphysema due to A_1AT deficiency.[38]

Most strategies to increase the A_1AT levels in the lung have been conceived and evaluated by investigators at the Pulmonary Branch of the National Heart, Blood and Lung Institute (NHLBI). These strategies consist of therapies previously used with success in patients with other serum protein deficiencies. They include intravenous replacement of missing serum proteins in diseases such as hemophilia, hereditary angioneurotic edema, and hypogammaglobulinemia, and enhancement of release of endogenous proteins, such as C1 esterase inhibitor, by hepatocytes in patients with hereditary angioneurotic edema, as well as more novel approaches like A_1AT aerosol therapy and gene therapy. To provide adequate antielastase protection for the lungs in patients with A_1AT deficiency, it is estimated that the serum level of this protein should exceed 80 mg/dL (11 μM) and the AELF level exceed 9.5 mg/dl (1.3 μM) of fully functional A_1AT.

Enhanced A_1AT release from hepatocytes. Attempts were made to increase A_1AT levels in Z-homozygous individuals with severe deficiency of this enzyme by using agents that normally cause hepatocytes to release acute phase reactants, such as A_1AT. Typhoid vaccine and estrogen-progesterone combinations failed to significantly increase serum A_1AT levels. Attempts with danazol,[39]

Figure 1. Nonspecific therapeutic algorithm in chronic obstructive pulmonary disease

Preventive measures	Relieve airway obstruction			Miscellaneous	Lifestyle changes
	Mucolytics	Bronchodilators	Anti-inflammatory

a synthetic androgen without the serious side effects of anabolic steroids, and tamoxifen,[40] a nonsteroidal antiestrogen compound, caused minor increases in serum A_1AT levels, but not enough to provide adequate protection against neutrophil elastase in the lungs.

Intravenous replacement therapy with human plasma A_1AT. To achieve protective serum levels of A_1AT by direct intravenous infusion in patients with emphysema due to homozygous genetic deficiency or absence of that enzyme, a concentrated form of A_1AT is necessary. Today, the commercial preparation of lyophilized A_1AT is made by pooling human plasma from normal donors. When reconstituted, it contains approximately 20 mg of active A_1AT per ml along with small amounts of other serum proteins like $alpha_2$plasmin inhibitor, $alpha_1$antichymotrypsin, C1 esterase inhibitor, haptoglobin, antithrombin III, $alpha_1$lipoprotein, and albumin. On average, these preparations are 80% pure, and the A_1AT molecules are $64 \pm 2\%$ active.

Studies extending beyond 24 months have shown that intravenous infusions of human A_1AT are well tolerated when given in weekly doses of 60 mg/kg to patients with severe A_1AT deficiency (Z-homozygous, $M_{(malton)}$ homozygous, and null homozygous). These infusions produce peak serum levels of A_1AT exceeding 40 μM. They maintain nadir serum levels of A_1AT above 11μM and AELF levels of 2.62 ± 1.29 μM, just before the next infusion. A_1AT levels in AELF are above protective level and antineutrophil elastase activity is 2.42 ± 1.23 μM. This suggests the majority of infused A_1AT molecules traversing across the alveolar capillary membrane remain functional.[41] An equivalent amount of antineutrophil elastase protection is achieved when the A_1AT dose is increased to 250 mg/kg and infused intravenously at 28-day intervals. These monthly infusions are equally well tolerated when compared with weekly infusions, but it generally takes six to eight hours to infuse such a high-protein load.[42]

Aerosol therapy with human plasma A_1AT. Kinetic studies performed in dogs after infusion of radio-labeled A_1AT suggest that only 2% of the A_1AT is present in the lung at equilibrium. It is assumed that the remaining 98% is retained in nonpulmonary tissues and, in effect, wasted. An alternate approach that overcomes this limitation of intravenous infusion therapy is to aerosolize A_1AT directly to the lower respiratory tract where it is needed most.

Short-term studies have evaluated aerosolized administration of human plasma A_1AT to patients with homozygous Z-type A_1AT deficiency and emphysema. Twelve such patients were given 100 mg of purified human plasma A_1AT by aerosol every 12 hours for seven days.[43] BALF studies from these patients demonstrated that it is possible to deposit A_1AT in the lower respiratory tract using aerosol therapy. Serum levels of A_1AT after aerosol treatment with this glycoprotein also showed that A_1AT enters the bloodstream through the alveolar capillary membrane after aerosol inhalation.

Sheep breathing aerosolized human A_1AT were shown to have human A_1AT in the lymph draining from the lungs.[44] This observation, along with the human A_1AT aerosol therapy data, suggests that A_1AT accumulates in the alveolar interstitial space after aerosol administration. However, no human data demonstrates that the level of A_1AT in the interstitium from aerosol therapy is high enough to prevent elastin degradation. There is also concern about whether A_1AT aerosol therapy results in uniform distribution of this glycoprotein to all regions of the lung, especially in patients with obstructive lung disease.

Augmentation therapy with recombinant A_1AT. The remote possibility of transmitting viral diseases, the presence of small amounts of other proteins in human plasma A_1AT preparations, and the limited supply of commercially available A_1AT stimulated development of recombinant DNA-produced A_1AT (rA_1AT). The rA_1AT is identical to human plasma A_1AT except that it is not glycosylated and, therefore, has a low molecular weight of 45,000. It also has an additional methionine residue at the N-terminus. In addition, the rA_1AT is just as effective in inhibiting human neutrophil elastase as the commercially available human A_1AT.

Pharmacokinetic studies following intravenous infusion of rA_1AT in rhesus monkeys have demonstrated that, in contrast to native human A_1AT, rA_1AT has a much shorter half-life in circulation (69 ± 3 minutes versus 2.4 days in monkeys). Significant amounts of rA_1AT are excreted in urine because of lack of glycosylation. It diffuses quite readily across the alveolar capillary membrane and enhances antineutrophil elastase capacity in AELF.[45] There is no information as to whether the excretion of rA_1AT in urine produces nephrotoxicity.

Pharmacokinetic features of rA_1AT suggest that to achieve the desired threshold of antielastase protection in the lung, it would need to be given by intravenous bolus more than once a week. To obviate this problem, rA_1AT was administered without any adverse consequences by aerosol to Z-homozygous and null-homozygous patients with mild to moderate obstructive lung disease.[46] BALF and serum were obtained from these patients before and after aerosolizing 200 mg of rA_1AT. These studies demonstrated that the concentration of rA_1AT in AELF was 9 μM at four hours. It fell below the protective level of A_1AT in the lungs by 24 hours but remained significantly above pretreatment level. AELF antineutrophil elastase capacity in these patients was directly proportional to the rA_1AT level, and in null-homozygote patients, evidence suggested rA_1AT actually complexed with neutrophil elastase. Null-homozygote patients with undetectable levels of A_1AT prior to aerosol therapy had detectable levels in serum within 8 to 24 hours of aerosol therapy, suggesting that at least some aerosolized

rA_1AT reached the alveolar interstitium on its way to the pulmonary capillaries. These studies indicate a 200 mg or higher dose of rA_1AT aerosolized daily may provide adequate protection in patients with severe A_1AT deficiency.

Augmentation with modified recombinant A_1AT. As discussed earlier, the A_1AT molecule is ineffective against human neutrophil elastase when the methionine[358] at the enzyme active site of native A_1AT is oxidized. A genetically engineered human A_1AT with methionine[358] replaced by valine has been produced in yeast and bacteria. Like other recombinant proteins, this one lacks carbohydrate side chains. *In vitro* studies have demonstrated that although methionine[358] valine substitution does not affect the antineutrophil elastase activity, it makes genetically engineered rA_1AT 10 times more resistant to oxidative inactivation by neutrophils and, to a lesser extent, the oxidative inactivation by the gas phase of cigarette smoke.[47] Although this kind of research offers great promise, *in vivo* studies are needed to establish safety and efficacy.

Gene therapy to augment A_1AT. Viruses have been used as vectors for transfer of human A_1AT gene to cells and animals to evaluate the ability of this gene to express itself and produce normal human A_1AT. Two viruses—an appropriately modified retrovirus and an adenovirus—have been used as vectors for the human A_1AT gene. One major difference between these two viruses is that the retrovirus requires proliferation of infected cells for expression of retroviral proteins, including A_1AT, and the adenovirus does not.

A retrovirus carrying human A_1AT gene has been used to transfect fibroblasts,[48] and the infected fibroblast cell lines have been shown to secrete normal, functional human A_1AT. These fibroblasts were subsequently implanted intraperitoneally into athymic nude mice. Four weeks later, these mice had human A_1AT in their serum and BALF, suggesting the fibroblasts were the source of human A_1AT. The possibility of this retroviral vector being used to transfect and induce expression of the human A_1AT gene in mouse and human T lymphocytes is being evaluated. If successful, then the next step is to see if these transfected T lymphocytes can be infused into animals and humans to evaluate their ability to synthesize and release adequate amounts of human A_1AT into circulation and AELF.

Similarly modified adenovirus containing human A_1AT gene has been used successfully to transfect Chinese hamster ovarian and human cervical cell lines, as well as freshly removed tracheobronchial epithelial cells from cotton rats. All these transfected cells produced human A_1AT glycoprotein. Modified adenovirus containing human A_1AT gene has also been administered intratracheally to cotton rats.[49] Lungs and BALF obtained from infected rats were evaluated for production of human A_1AT. These studies show human A_1AT in the lungs and AELF of these animals for up to one week after infection.

At present, weekly intravenous replacement therapy with commercially available human plasma A_1AT (Prolastin) in 60 mg/kg doses is recommended only for patients with severe A_1AT deficiency.[50] Selection guidelines for A_1AT augmentation, or replacement, therapy have been developed because this therapy has not been subjected to long-term prospective trials but is presumed to be effective in halting progression of emphysema, the cost of this therapy for an adult exceeds $20,000 a year, and development of obstructive lung disease is quite variable in patients with congenital A_1AT deficiency. Augmentation therapy is indicated only for individuals with PiZZ; PiZ, Null; PiNull, Null; $PiM_{(malton)}$, $M_{(malton)}$; or other rare phenotypes associated with serum levels below 11 μM. These patients must be over 18 years of age, current nonsmokers, and have evidence of obstructive airways disease on pulmonary function test. They must also be compliant with the cumbersome and demanding schedule of weekly therapy.

A_1AT augmentation therapy is not indicated for cigarette-induced emphysema associated with normal A_1AT phenotypes. It is not indicated for individuals with normal A_1AT phenotypes associated with serum levels of A_1AT lower than normal but above 11 μM. Individuals with serum A_1AT levels below 11 μM but with normal lung function and individuals with deficient A_1AT phenotypes and liver disease but no evidence of obstructive lung disease should not be given A_1AT augmentation therapy.

All prospective candidates for Prolastin therapy should be screened for HIV (human immunodeficiency virus) and hepatitis B and C virus antibodies prior to initiation of therapy. Individuals who do not have antibodies against hepatitis B should be immunized with a licensed hepatitis B virus vaccine before or concomitant with initiation of therapy.

Decrease the elastase burden in the lungs. Therapeutic approaches that decrease elastase burden in the lungs are theoretically applicable to patients with genetic forms of emphysema due to A_1AT deficiency as well as acquired forms of emphysema due to cigarette smoking. One important step in reducing the elastase load in the lungs of emphysema patients is to reduce the burden of inflammatory cells in lung parenchyma. This can be achieved by reduction of exposure to respiratory irritants, including cigarette smoke, and by aggressive therapy of lower respiratory tract infections.

Another approach being explored is the development of natural and synthetic inhibitors of human neutrophil elastase. Ideally, these inhibitors should be delivered, or preferentially activated, in the lung interstitium, where they would affect only the neutrophil elastase present in the lung without causing systemic inhibition of neutrophil elastase.[51,52] Both natural (Eglin C derived from leeches) and several synthetic inhibitors of human neutrophil elastase have been developed. They have been effectively used to prevent or reduce emphysema develop-

ment following tracheal instillation of human neutrophil elastase in animals.

A new class of human neutrophil elastase inhibitors, the oleyl peptides, are fatty-acid peptides such as oleyl-alanyl-alanyl-prolyl-vali. Besides inhibiting neutrophil elastase, these compounds also bind to mature elastin and elastin fragments. They protect mature elastin from elastolytic enzymes and prevent induction of monocyte chemotaxis by elastin fragments. To date, no successful strategy produces the preferential inhibition of neutrophil elastase only in the lung interstitium. Aerosol inhalation is a possible way of preferentially delivering synthetic elastase inhibitors to the lung alveolar surface. Another approach is to incorporate synthetic inhibitors into biodegradable human albumin microspheres. These microspheres are of such size that after intravenous injection they become trapped in the pulmonary capillaries and release these inhibitors locally into the lung interstitium. Obviously, more information and better inhibitors are needed. There is, however, an encouraging prospect that a suitable synthetic elastase inhibitor will soon be available for use in humans.

Lung transplantation

Although the first human lung transplant was performed by Hardy and coworkers in 1963, only in the last decade has human lung transplantation become a viable therapeutic option. This is a result of the tremendous progress in tissue preservation techniques, surgical techniques that minimize breakdown and dehiscence of bronchial anastomoses, and diagnostic and therapeutic modalities that are extremely helpful in recognizing and managing graft rejection. Heart-lung transplantation, double lung transplantation, and unilateral lung transplantation have been performed successfully in emphysema patients. Currently, lung transplantation is preferred over heart-lung transplantation. However, there is no consensus at present as to whether double lung[53] or unilateral lung transplantation[54] is ideal for emphysema patients.

VICE PRESIDENT MEDICAL STAFF RELATIONS

Northwest Hospital Center, an acute-care, 240 bed adult medical surgical non-profit facility, is a progressive institution dedicated to providing the highest quality patient centered care. Our philosophy of excellent service extends to the newly constructed Outpatient Services Center which opened June 1993. Availability of the latest technology enables physicians to provide advanced diagnosis and treatment in both the inpatient and outpatient setting. Our focus on quality is further assured by a diverse medical staff of more than 500 doctors in a wide range of specialties and a highly skilled nursing and support staff.

We are currently in search of a Board Certified Physician who will coordinate the Medical Staff Quality Improvement Program insuring that activities are consistent with the Hospital's mission and JCAHO standards as well as state and federal laws and regulations. Other areas of responsibility include coordination of the hospital's Utilization Review Program; coordination of all accreditation, certification and licensure surveys related to the medical staff, and coordination of the medical staff credentialing process. Reporting to the President, this full-time position serves as the primary administrative liaison with the medical staff providing supervision of house staff, physicians assistants, paid clinical chiefs and the medical staff office.

If you have 3+ years in an active practice, prior experience in Medical Staff Quality Assurance and Utilization Review activities, and proven clinical leadership ability, we would like to hear from you. We offer a highly competitive compensation and benefits package in a convenient, suburban Baltimore setting. **Please forward C.V. to: Physician Recruiter, Human Resources Department, Northwest Hospital Center, 5401 Old Court Rd., Randallstown, MD 21133.** EOE.

Northwest Hospital Center

The hospital centered around its patients.

Dipyridamole-thallium stress testing: A local community hospital experience*

Abiodun G. Olatidoye, M.D., A.C.P. associate, and Romulo F. Baltazar, M.D., F.A.C.P.

From the Department of Medicine, Division of Cardiology, Sinai Hospital of Baltimore, where Dr. Olatidoye is a resident in internal medicine and Dr. Baltazar is director, Noninvasive Cardiac Laboratory.

ABSTRACT: *Clinical data on the first 100 patients who underwent dipyridamole-thallium stress testing in our hospital were reviewed in order to re-evaluate safety guidelines and diagnostic utility in patients with coronary artery disease. Forty patients developed symptoms, including three major ones. One patient had significant bronchospasm, and two others developed significant hypotension with near syncope. The rest had nonspecific chest, shoulder, arm or throat pain, dyspnea, nausea, vomiting, and paresthesia. Most symptoms occurred within the first 10 minutes of dipyridamole infusion. Twenty-eight patients required treatment with intravenous (IV) aminophylline. Of the remaining 60 patients, 30 became hypotensive but remained asymptomatic.*

Fourteen of 20 patients who underwent coronary angiography had coronary disease. Thirteen were correctly identified by thallium imaging, and only one was identified by electrocardiogram (EKG). Six patients' angiographies showed no evidence of coronary disease. Five of these patients developed perfusion abnormalities during thallium scintigraphy.

These results suggest that dipyridamole is a relatively safe drug for pharmacologic stress testing even though the incidence of side effects is relatively high. The high incidence of thallium perfusion abnormalities in patients without coronary disease probably reflects bias in patient selection for coronary angiography, resulting in a relatively small sample of catheterized patients. However, this requires further investigation.

In January 1991, dipyridamole became the first pharmacologic agent approved by the Food and Drug Administration (FDA) for stress testing.

* *Presented at the American College of Physicians Associates meeting on May 21, 1992.*

Table 1. Risk factors for coronary artery disease

• Hypertension	54%
• Smoking	49%
• Diabetes mellitus	27%
• Family history of coronary artery disease	20%
• Hypercholesterolemia	8%
• Previous myocardial infarction or coronary artery disease	8%
• Peripheral vascular disease	5%
• No known risk factors	8%

With the availability of this agent, a number of patients with various medical conditions that limit their ability to exercise can now be tested; and dipyridamole testing yields the same or even more information than is obtained from regular exercise tests.[1]

Dipyridamole becomes the physiologic parallel of stress by increasing endogenous adenosine concentration.[2] Adenosine, a potent coronary vasodilator, increases blood flow to normal arteries by about two to fivefold, with a much lesser increment in diseased arteries.[3] This results in a coronary steal phenomenon whereby myocardium areas supplied by diseased arteries become relatively ischemic and less perfused. In contrast, areas supplied by normal arteries remain well perfused.[4-5] This disparity in myocardial perfusion can be demonstrated by a tracer substance such as thallium-201.[1,3-5]

Since the introduction of dipyridamole, we have performed 217 dipyridamole-thallium stress tests within a 15-month period. The first 100 patients were referred during the first 10 months. Approximately the next 100 referrals were tested within the next five-month period, suggesting increasing use and acceptance of this test in evaluation of patients with suspected coronary artery disease (CAD) in our institution. We reviewed the first 100 patients tested in order to re-examine the initial test administration guidelines and to re-evaluate the test's safety and utility in CAD diagnosis.

Patient population

Fifty-six females and 44 males underwent dipyridamole-thallium stress testing because of symptoms suspicious for CAD. Patients' ages ranged from 49 to 86 years; the mean age was 69. Patients unable to walk on the treadmill included those with peripheral vascular disease, those with degenerative arthritis, patients recovering from a cerebrovascular accident (CVA), and a few with chronic lung disease histories who were not actively wheezing at the time of study. One patient had a popliteal aneurysm, and another had an abdominal aortic aneurysm. Another indication for testing was a relatively inconclusive, low-level treadmill exercise test. Testing contraindications included significant bronchospastic disease with active wheezing, suspected unstable angina, and the immediate postmyocardial infarction period.

Most patients had one, or more frequently, multiple coronary risk factors. Hypertension was present in 54% of patients, smoking in 49%, diabetes mellitus in 27%, and a family history of CAD in 20%. Eight percent of patients had hypercholesterolemia, another 8% had a history of previous myocardial infarction, and 5% had peripheral vascular disease. Eight percent of patients had no known coronary risk factors (**Table 1**).

Methods

Patients were advised not to eat or drink xanthine-containing foods and beverages for 24–36 hours before testing. On the day of testing, each patient received 0.56 mg of dipyridamole per kg of body weight diluted with normal saline to a total volume of 60 cc, which was injected intravenously within four minutes as recommended. The electrocardiogram (EKG) was displayed continuously on an oscilloscope, and 12-lead tracings were obtained at baseline and every minute thereafter. Blood pressure was monitored every minute. Three millicuries of thallium-201 were injected at least two minutes after completion of dipyridamole injection. Tomographic imaging was performed with single photon emission computed tomography (SPECT) four minutes after thallium-201 was injected, and redistribution images were obtained after three to four hours, with re-injection of another two millicuries intravenously.

For electrocardiographic results, an exercise test was considered positive if 1 mm or more of horizontal or downsloping ST segment depression was present in at least three consecutive beats in any of the 12-leads during or after dipyridamole infusion. Thallium perfusion scans were considered positive if a fixed defect was present in any tomographic view or a reversible defect was noted during the reperfusion period. The patient's EKG, blood pressure, heart rate, and rhythm were recorded. Every symptom or sign observed during testing was documented, as well as temporal occurrence of such symptoms.

Results

Sixty of 100 patients (60%) remained completely asymptomatic during dipyridamole stress testing. Forty patients (40%) developed symptoms. Two patients (2%) became severely hypotensive and had near syncope. One patient developed junctional rhythm with a slow ventricular rate of 40–45 beats per minute before becoming severely hypotensive with no obtainable blood pressure. This patient initially had a sinus bradycardia with a rate of 50 beats per minute but was otherwise stable. A quadriplegic patient developed severe hypotension with near syncope during infusion and had a fixed, glassy stare with no blood pressure and barely palpable pulses. Both episodes were reversed successfully with aminophylline and

Table 2. Symptoms

• **Asymptomatic**	60
• **Symptomatic**	40
• Major symptoms	3
• Hypotension with near syncope	2
• Bronchospasm	1
• Minor symptoms	37
• Headache	14
• Dyspnea	11
• Nausea	6
• Vomiting	1
• Chest/arm/shoulder throat pain	22
• Paresthesia	1

intravenous (IV) fluid therapy. A patient with a history of bronchial asthma developed severe bronchospasm but responded to repeated aminophylline doses. Symptoms in these three patients were considered significant and life-threatening and, as such, are regarded as major symptoms.

The remaining 37 patients had minor symptoms that were not life-threatening. Several patients developed more than one symptom, the most common being headache, which occurred in 14 patients. Nonspecific chest, shoulder, arm, or throat pain occurred in 22 patients, dyspnea in 11 patients, nausea in 6 patients, vomiting in 1 patient, and paresthesia in 1 patient **(Table 2).**

Most symptoms occurred within the first 10 minutes after infusion (37 patients). Only three patients developed symptoms beyond this period. One patient complained of headache 15 minutes postinfusion, a second in the 17th minute, and a third patient had headache 23 minutes postinfusion. Of the 40 symptomatic patients, 28 required IV aminophylline treatment. Occasionally, sublingual nitroglycerine or IV fluids were given when initial aminophylline treatment was not effective.

The majority of patients also developed hypotension not associated with any symptoms. In an occasional patient, the total dipyridamole dose was not completed because of significant systolic blood pressure drops (>30 mm Hg), which were not accompanied by symptoms. The drops in blood pressure usually occurred in patients with initial systolic blood pressure of 100–120 mm Hg. In a few others, dipyridamole infusion had to be given longer than the recommended four minutes because of a significant systolic blood pressure drop by more than 30–40 mm Hg in spite of the absence of symptoms.

The EKG monitor did not show any significant ectopic beats during or after infusion, suggesting that dipyridamole is not an arrhythmogenic agent. Although there is a potential for arterioventricular (AV) block, this complication was not observed in our patients. One patient, however, developed junctional rhythm before developing hypotension with near syncope.

Table 3. Coronary angiography correlation with electrocardiogram

• Patients with coronary disease	14
(+) EKG changes	1
(-) EKG changes	13
• Patients without coronary disease	6
(+) EKG changes	1
(-) EKG changes	5

(+) EKG indicates 1 mm or more of horizontal or downslope ST depression in at least three consecutive beats during or after infusion.

Twenty of our 100 patients underwent coronary angiography within one month of the dipyridamole study. Left main coronary disease was defined as 50% or greater narrowing of the luminal diameter of the left main coronary artery, and significant CAD was defined as 70% or greater diameter narrowing of any of the three coronary arteries or their major branches. Fourteen of 20 patients had CAD. Of the 14 patients with coronary disease, the EKG was negative in 13 of them. Of the six patients without coronary disease, five had no EKG changes and one had a positive ischemic response **(Table 3).**

Of the 14 patients with coronary disease, 13 showed perfusion defects during thallium scanning, 11 of which were reversible defects and 2 of which were fixed defects. Only one patient with coronary disease was negative for any perfusion defect. Of the six patients without coronary disease, five were thallium-positive, including four with reversible defects and one with a fixed defect. One patient did not show any perfusion abnormalities **(Table 4).**

Table 4. Coronary angiography correlation with thallium scan*

• Patients with coronary disease	14
(+)Thallium perfusion	13
(-) Thallium perfusion	1
• Patients without coronary disease	6
(+) Thallium perfusion	5
(-) Thallium perfusion	1

(+) Thallium perfusion indicates a fixed or reversible defect.
**Note: Although 68 of 100 patients had abnormal perfusion scans, only 20 patients underwent cardiac catheterization.*

Discussion

Dipyridamole, a complex pyridine, is a potent coronary vasodilator that increases blood flow at least two to five times baseline. In the presence of coronary stenosis, blood flow is maintained by vasoregulatory mechanisms resulting in maximal vasodilatation of resistance vessels distal to the stenosis. Since the vessels supplying ischemic myocardium are already maximally dilated, dipyridamole administration will not result in further dilatation of these vessels but, instead, will dilate other resistance vessels supplying normal myocardium. The flow increase to areas supplied by normal vessels occurs at the expense of flow to areas supplied by arteries with significant stenosis, resulting in the "steal" phenomenon.

The heterogeneity in myocardial perfusion, whereby blood flow is increased in areas supplied by normal arteries and diminished in areas with significant stenosis, will result in perfusion mismatch that can be demonstrable by thallium-201. Dipyridamole indirectly causes vasodilatation by increasing adenosine concentration by cellular uptake inhibition or inactivation of adenosine deaminase, the enzyme that degrades adenosine; therefore, direct intravenous adenosine injection will result in the same hemodynamic alterations.

Based on our experience, we believe that dipyridamole is a relatively safe pharmacologic agent for stress testing, although at least 40% of our patients experienced some kind of symptoms. In addition, 30 patients developed mild hypotension but remained asymptomatic. In three patients, the symptoms were significant and life-threatening. The most significant life-threatening complication was hypotension with near syncope.

We consider symptomatic hypotension characterized by dizziness and near syncope a significant symptom since all our patients were recumbent during testing. A drop in systolic blood pressure significant enough to cause near syncope in a recumbent patient may potentially result in myocardial or cerebral ischemia or even infarction. Dizziness is a much more frequent symptom in the literature, occurring in 11.8% of patients.[6] This is probably because some patients reported in the literature were tested upright, including some who walked in place before thallium infusion.[2] Since all our patients were recumbent, we consider dizziness associated with a drop in systolic blood pressure of more than 30 mm Hg a reason to modify or discontinue dipyridamole infusion.

Since our priority during initial testing was primarily patient safety, we often modified the injection duration or terminated the injection outright if patients developed symptoms due to hemodynamic compromise. In patients whose baseline systolic blood pressure was low normal (100–110 mm Hg), a drop of only 10 to 15 mm Hg may be significant enough to cause symptoms. Although a 10% drop in systolic blood pressure is usually expected following dipyridamole infusion, the severe hypotension manifested in two patients was totally unexpected. These two patients showed no features that would identify them as high risk for developing this complication. One patient, however, was quadriplegic, and we assume that the vasodilation caused by dipyridamole was not compensated by adequate vasomotor reflexes, resulting in significant hypotension. The other patient developed an AV junctional escape rhythm due to sinus arrest and became markedly hypotensive with near syncope. This is not a totally unexpected arrhythmia resulting from dipyridamole.

Only one patient developed significant bronchospasm at the start of the series. We still consider some patients with a chronic lung disease history as candidates for dipyridamole stress testing if they are not symptomatic at the time. The availability of other pharmacologic agents such as adenosine,[7] which has a much shorter half life, and dobutamine,[8] which is not contraindicated in chronic lung disease and in sinoatrial or AV block, has allowed pharmacologic stress testing in patients who cannot tolerate dipyridamole.

In virtually all patients, symptoms initially developed during infusion or within 10 minutes after starting infusion. These observations led us to modify our monitoring practices for performing dipyridamole stress tests. Formerly, we monitored patients through the drug's duration of action, which is 20–30 minutes; we now consider it safe to discontinue monitoring after 10 minutes if no symptoms or significant hypotension have occurred. Since some patients will have no symptoms or significant hemodynamic changes, we do not consider routine administration of the antidote aminophylline in all patients undergoing dipyridamole testing. Aminophylline (an adenosine receptor antagonist), however, is given routinely to terminate any symptom or when significant hypotension is present, even if the patient is asymptomatic.

The majority of our patients (68 of 100) had positive thallium-perfusion defects. Of these, only 20 patients eventually underwent coronary angiography. Although 13 of 14 patients with CAD showed thallium-perfusion defects, and five of six patients without CAD had abnormal scans, the significance of these findings is uncertain and probably misleading since only a few selected patients were catheterized. Furthermore, most patients with no perfusion defects and no coronary disease, were excluded from referral, resulting in the catheterization mostly of patients thought to have the disease. The exclusion of most patients with negative thallium perfusion defects will ultimately result in poor specificity.[9]

On the other hand, the EKG showed a positive ischemic ST-T response in only 1 of 14 patients with CAD. Although the EKG is a poor marker for CAD during dipyridamole stress testing, the changes in heart rate which are electronically displayed are helpful in anticipating blood pressure fluctuations. An increasing heart rate response usually coincides with a falling blood pressure. As the heart rate peaks and then slowly

decreases back to baseline levels, this usually heralds the return of blood pressure to baseline.

Dipyridamole stress testing is a safe pharmacologic procedure in spite of the presence of symptoms in 40% of our patients and mild hypotension in another 30% who were asymptomatic. Symptoms are effectively relieved by intravenous aminophylline administration. Since serious complications are possible with this agent, patients should be properly screened prior to the procedure, and the test should be performed by knowledgeable personnel. This information should be taken into consideration before using dipyridamole-thallium stress testing in the evaluation and management of patients suspected of having CAD.

Myopathy and cardiomyopathy associated with selenium deficiency: Case report, literature review, and hypothesis

Roger W. Marcus, M.D., F.A.C.R.

Dr. Marcus is a rheumatologist, Section of Rheumatology, Franklin Square Hospital Center, and division head of rheumatology, Fallston General Hospital.

ABSTRACT: *A case of selenium-deficiency myopathy, secondary to total parenteral nutrition, is presented. The literature on selenium-deficiency myopathy and cardiomyopathy is reviewed in the context of the literature concerning selenium status in numerous diseases. An hypothesis of a wider role for selenium deficiency in the pathogenesis of myopathy and cardiomyopathy is presented.*

Selenium deficiency, resulting from residence in an area with selenium-deficient soil or from total parenteral nutrition (TPN), has been associated with myopathy and cardiomyopathy development.[1-17] In this report, a patient on TPN with a reversible myopathy associated with a low serum selenium level is described.

An extensive literature has been compiled documenting selenium status in relationship to geography, age, pregnancy, and disease states.[18,19] It can be argued that the frequent occurrence of selenium deficiency in patients with various chronic illnesses suggests that selenium deficiency may contribute to the production of myopathy and cardiomyopathy in those settings.

Case presentation

The patient was a 49-year-old white female with carcinoma of the colon and extensive intraperitoneal metastases. She was treated with extensive removal of intraperitoneal metastases and intraperitoneal installation of mitomycin. In July 1989, the patient was started on selenium-free TPN. In September, she noted tenderness, without spontaneous pain, involving both lateral hip areas and volar wrists. Over the following weeks, tenderness spread to the upper arms, buttocks, thighs, and calves, and the thighs became painful upon stair climbing. She eventually developed a limited painful right shoulder and a sense of morning stiffness involving her fingers, knees, and lower back.

She was seen by this physician in November 1989 and, on examination, was noted to have a very stiff gait and difficulty maneuvering in the examination room. Conjunctivae and oral mucous membranes were normal. There was no cervical lymphadenopathy or thyromegaly. The chest was clear, heart sounds were normal, and breasts were without masses. The abdomen was firm and mildly diffusely tender, without liver, spleen or definable masses palpable. Muscles of the upper arms, buttocks, and anterior and lateral thighs were tender. The right shoulder had limited flexion to 90 degrees. Otherwise, all upper and lower extremity joints had full range of motion without evidence of synovitis. There was a marked strength reduction of left hip flexion and knee extension, and an absent left patellar tendon reflex. Muscle testing and general neurological examination were otherwise normal.

Laboratory data: hemoglobin (Hgb), 10.6 g/dl (1.64 nmol/L); mean corpuscular volume (MCV), 85 ccu (85 fl); white blood count (WBC), 4.0 x 10^3/μl (4.0 x 10^9/L); platelets, 305,000/μl (0.305 x 10^{12}/L). Sedimentation rate, 38 mm/hr. Alkaline phosphatase, 138 IU/L (138 U/L). Routine chemistries were otherwise normal. Iron, 47 mcg/dl (8.4 μmol/L); total iron-binding capacity (TIBC), 407 mcg/dl (72 μmol/L); ferritin, 23 ng/ml (23 μg/L). Prothrombin time (PT), 12 sec; Partial thromboplastin time (PTT), 25 sec. Magnesium, 1.8 mEq/L (0.9 mmol/L). Anti-nuclear antibody (ANA), negative. T4, 7.5 μg/dl (97.5 nmol/L); T3, 15 ng/dl (1.9 nmol/dl); thyroid-stimulating hormone (TSH), 2.1 mU/ml (2.1 x 10^{-3} IU/L). Creatine phosphokinase (CPK), < 20 U/L. Serum selenium, < 50 mcg/L (normal = 55–130 mcg/L).

The patient was treated with selenious acid (200 mcg/day) added to the TPN solution. Muscle tenderness improved. The repeat serum selenium level was 100 mcg/L. Inadvertent discontinuation of selenium was associated with a recurrence of extreme muscle tenderness, but resumption of selenium replacement, again, resulted in a marked reduction of muscle tenderness.

Discussion

Selenium, a trace element, resembles sulfur in many of its chemical properties.[19] It can be incorporated into sulfur amino acids and proteins, and participate in disulfide and trisulfide linkages. The only known human selenoenzyme is glutathione peroxidase, and the presence of selenium is necessary for its synthesis. Glutathione peroxidase catalyzes the reaction:

$$2GSH + H_2O_2 \text{ (or R-OOH)} \rightarrow GSSH + 2H_2O \text{ (or } H_2O + ROH)$$

This enzyme, along with catalase and superoxide dismutase, prevents membrane oxidative damage by hydrogen peroxide and lipoperoxide. A loss of this protective mechanism is postulated as the basis for the various clinical syndromes associated with selenium deficiency.[2,4,6,9,15,20]

The first case of selenium-deficiency myopathy in a patient on TPN was reported by Van Rij and colleagues in 1979.[1] There has since been an intense interest in the effects of selenium depletion and repletion in patients on TPN and in the clinical manifestations of selenium deficiency in this population.

It has been shown that TPN solutions lack selenium unless it is specifically added. After one to two months of TPN onset, plasma selenium levels decrease below the normal range, accompanied by a reduction in erythrocyte glutathione peroxidase.[1] Selenium administration causes restitution of normal plasma selenium levels and repletion of erythrocyte glutathione peroxidase.[2] Subsequent to the initial report, seven patients have been reported with selenium-deficiency myopathy, manifested as muscle pain, tenderness, or weakness that may be accompanied by a gait disorder.[2–7] CPK was elevated in four of these eight patients, and an assay for CPK was not reported in three. One patient presented with painless proximal muscle weakness and a normal CPK.[6] In one patient, muscle biopsy showed a mild increase in central nuclei and in connective tissue between muscle fibers, associated with type II fiber atrophy.[4] Electromyography in two patients showed membrane irritability in one[3] and increased polyphasic potentials with reduced amplitude of potentials in another.[4] All patients experienced reversal of myopathy symptoms after a selenium compound was added to their TPN solutions. Other clinical findings that have been ascribed to selenium deficiency in this patient population are macrocytosis, pseudoalbinism, and white fingernails.[5–7]

In 1981, a patient who had been on TPN for two years developed an acute dilated cardiomyopathy with acute pulmonary edema and ventricular arrhythmias.[8] At autopsy, the left ventricular myocardium showed patchy irregular areas of myocardial cell loss with replacement of fibrous tissue predominantly in the subepicardial and midmural regions. Five similar patients were subsequently reported; two improved with selenium replacement.[9–13]

Selenium deficiency can also result from residence in areas of China, New Zealand, or Finland, all of which have selenium-poor soil.[14] Keshan disease, an endemic cardiomyopathy occurring in an area of selenium-deficient soil in China, is preventable with dietary supplementation with selenium.[14–16] Initially described, in 1935, as an endemic illness in the Keshan area of northeastern China, Keshan disease was manifested by nausea, vomiting, precordial pressure, and death.[15–16] It was soon recognized to be a myocardial disorder. Since 1935, Keshan disease has been identified in a wide belt of China, ranging from the southwest to the northeast, within which there are specific focal areas of high disease incidence.[15] The clinical presentation of Keshan disease ranges from a fulminant onset with cardiogenic shock, acute pulmonary

edema, and arrhythmias, to a latent form with compensated cardiac function.[15,21]

Because an analogy with scleroderma heart disease will be made, it is important to review two studies of the cardiac pathology of Keshan disease.[21-22] The hearts were dilated with either a normal or slightly thickened left ventricular wall, and mural thrombi were frequently present. Patients with acute onset had subendocardial areas of necrosis. Patients with subacute onset had smaller areas of necrosis with a miliary pattern. Patients with a chronic onset had irregular patches of fibrosis streaks. Fresh and old lesions coexisted in the same hearts, suggesting that the illness is not a single exposure to an environmental agent. Miliary foci were usually present around branching types of coronary arteries, producing a "cluster of grapes" appearance. At times, the myocardial lesion was shown to course along the entire length of a straight artery, forming a perivascular cuff. The relationship of the lesions to vessels, the sparing of the innermost myocardium, and the occurrence of fresh lesions around old lesions suggested that pathogenesis is influenced by the pattern of myocardial perfusion. On a microscopic level, there was contraction band necrosis and progressive vacuolization of myocardial cell cytoplasm. Regenerating myocardial fibers were identified. There was minimal or absent inflammation. The pathology of Keshan disease was thought to be distinct from that of congestive cardiomyopathy and viral myocarditis.

The soil in areas in which Keshan disease is endemic is selenium deficient. Wheat, corn, rice, and soybeans grown in these areas contain one-eighth the selenium of grains from unaffected areas.[16] The safe and adequate dietary intake of selenium, as established by the Food and Nutrition Board of the National Research Council, is 50–200 mcg per day, and the daily intake of selenium in the American diet is in the 60–220 mcg range.[18] In the areas of China in which Keshan disease is endemic, average selenium intake is 8.8–12 mcg per day. Patients with Keshan disease have low levels of selenium in blood, cardiac, and skeletal muscle, and in hair. In addition, low levels of glutathione peroxidase and elevated levels of lipid peroxide have been identified in those patients.[20] The elevated lipid peroxide level suggests that oxidative membrane damage is occurring.

Between 1974 and 1976, an extensive controlled study was undertaken to determine whether sodium selenite could prevent Keshan disease.[17] Half of the children studied took a weekly dose of sodium selenite: 0.5 mcg for ages 1–5 and 1 mcg for ages 6–9. Between 1976 and 1977, all children received sodium selenite. In 1974, 54 of 3,985 control patients (13.5/1,000) developed Keshan disease, with a 50% mortality. Only 10 of 4,510 treated patients (2.2/1,000) developed Keshan disease, and there were no deaths. Individuals with Keshan disease in the selenium-treated group had a better outcome than those in the untreated group. In addition, the development of Keshan disease in three of the individuals in the selenium-treated group commenced prior to the fourth dose of sodium selenite.

A similar experience was reported for 1975. By 1977, in 12,749 subjects who complied with the use of supplemental sodium selenite, there were no cases of Keshan disease. Two subsequent controlled prevention studies involving 1.6 million subjects showed an incidence of 0.12–0.27 cases per 1,000 treated subjects and 1.55–3.75 cases per 1,000 untreated subjects.[15] Further analysis showed that many cases of Keshan disease in treated groups involved people who were not taking the sodium selenite. On the other hand, the Chinese experience with Keshan disease indicates that established cardiomyopathy does not improve with selenium supplementation.[15] Based on analysis of grain selenium in affected and unaffected areas of China, the daily selenium intake necessary to prevent Keshan disease is 30 mcg per day.[14]

The highest incidence of Keshan disease occurs in poor families with multiple children in rural and mountainous areas.[14,15] Urban workers living in rural areas have consistently higher hair selenium levels than people living and working in rural areas, and the urban workers are rarely affected by Keshan disease.[14-16]

Keshan disease has a marked seasonal incidence, more frequent in winter in northeastern China and in summer in southwestern China. Selenium status in affected areas does not vary with these fluctuations in disease incidence.[14,15] This seasonal incidence of Keshan disease suggests an infectious factor. Indeed, 56 different viruses have been isolated from cardiac muscle, heart blood, or venous blood from 83 patients with Keshan disease. Most isolated viruses were echo or Coxsackie strains.[15,16] Electron microscopy of 7 of 11 hearts from patients with Keshan disease revealed small (20–27 millimicron) unidentified particles in myocardial cells that were interpreted as possibly viral particles.[16] In a well-controlled experiment, mice fed a selenium-poor diet and injected with Coxsackie B virus experienced more severe myocardial injury than mice fed a diet with adequate selenium. Another factor proposed to be operative in Keshan disease is concurrent Vitamin E deficiency. Vitamin E levels in areas where Keshan disease is endemic are below normal, but are unaffected by selenium status.

Low plasma, serum, or tissue levels of selenium, occasionally associated with low levels of glutathione peroxidase, have been demonstrated in a wide range of acute and chronic illnesses

(**Table**). Low selenium levels have been demonstrated in patients with rheumatoid arthritis—the most extensively studied of the rheumatic diseases. It is most marked in patients with severe disease and improves after successful treatment with gold and penicillamine.

Another study failed to find low selenium levels in patients with rheumatoid arthritis or other inflammatory arthritides, but did note a dose-dependent depression of selenium levels in patients treated with corticosteroids. Controlled and uncontrolled trials of selenium supplementation in patients with rheumatoid arthritis failed to show significant benefit. Reduced serum selenium levels and glutathione peroxidase activity occur in patients with juvenile chronic polyarthritis; the decline in glutathione peroxidase correlates with disease activity. Studies of possible roles of selenium in immune functions and in rheumatic diseases were recently reviewed.[23]

Table. Disease states associated with low plasma, serum, or tissue selenium levels

Low birth weight	Cryptogenic cirrhosis
Hyaline membrane disease	Primary biliary cirrhosis
Bronchopulmonary dysplasia	Intrahepatic cholestasis of pregnancy
Cystic fibrosis*	Intestinal obstruction and intestinal failure
Acute life-threatening illness	Extensive ulcerative colitis
Extensive burns	Crohn's disease
Bacterial infection	Celiac disease
Kwashiorkor	Whipple's disease
Hemolytic anemia of protein energy malnutrition	Acrodermatitis enteropathica
Acquired immunodeficiency syndrome (AIDS)	Carcinoma
Myocardial infarction*	Chronic lymphocytic leukemia
Cardiomyopathy*	Down's syndrome
Chronic renal failure (with or without peritoneal or hemodialysis)	Neuronal ceroid lipofuscinosis
Rheumatoid arthritis*	Myotonic dystrophy
Juvenile chronic polyarthritis	Duchenne muscular dystrophy
Alcoholism and alcoholic liver disease	Low protein diet therapy of phenylketonuria and maple syrup urine disease
Chronic active and persistent hepatitis	Mental retardation, multiple causes

*Contradictory studies

The extensive literature on selenium status in so many disease states invites conjecture regarding possible roles for deficiency of this micronutrient in producing disease manifestations. Known consequences of selenium deficiency, namely, myopathy, cardiomyopathy, macrocytosis, white fingernails and pseudoalbinism, may be manifestations of selenium deficiency. For example, selenium deficiency may play a role in the myopathy of rheumatoid arthritis, alcoholic myopathy and cardiomyopathy, carcinomatous myopathy, steroid myopathy, and myopathy of chronic ipecac ingestion, myopathy and cardiomyopathy of chronic renal failure, and the myopathy associated with acquired immunodeficiency syndrome (AIDS).

It is particularly intriguing to consider the cardiomyopathy and myopathy associated with systemic sclerosis. Contraction band necrosis, a lesion secondary to myocardial cell reperfusion, is found in 40%–77% of systemic sclerosis patients with severe cardiomyopathy,[24] and, as noted previously, contraction band necrosis is a major microscopic lesion in Keshan disease.[21–22] Transient coronary vasospasm episodes have been documented, in conjunction with Raynaud's phenomenon, in patients with systemic sclerosis.[25] Malnutrition and malabsorption of selenium would be reasonably expected to occur secondary to sclerodermatous involvement of the gastrointestinal tract. There are no reported measurements of selenium or glutathione peroxidase in patients with systemic sclerosis. Oxygen radicals are generated when myocardial reperfusion occurs, and they mediate the cellular damage that occurs. Superoxide dismutase and glutathione peroxidase prevent oxygen radical damage to the cellular membrane. In *in vitro* animal models of reperfusion injury, local depletion of glutathione peroxidase and superoxide dismutase occurs. If selenium deficiency is present in systemic sclerosis, it may worsen the inherent glutathione peroxidase deficiency of the reperfusion lesion, and facilitate the hydrogen peroxide oxidative damage produced in reperfusion injury of scleroderma heart disease.

Several papers address selenium deficiency in patients with cardiomyopathy and myopathy. One of the most intriguing is a study of eight patients with AIDS, who had low plasma selenium levels and a nonobstructive cardiomyopathy; the ventricular shortening fraction normalized after dietary supplementation with selenium. In another paper, a two-year-old American child was described with a severe congestive cardiomyopathy and low serum selenium level, hypothesized as the consequence of a diet containing 10 mcg of selenium per day. Cardiac function appeared to improve with selenium supplementation. A subsequent report described a patient with

severe Chrohn's disease and low blood selenium who developed an otherwise inexplicable cardiomyopathy that was reversible with administration of selenium.

Studies of selenium status in patients with cardiomyopathy, however, have been conflicting. One study showed lower selenium levels in patients with congestive cardiomyopathy, 25% of whom had a history of excessive alcohol intake. In that study, serum selenium levels correlated with left ventricular ejection fraction. Similar results were obtained in a study of congestive cardiomyopathy patients, including alcoholic cardiomyopathy patients; a Chinese study of congestive cardiomyopathy patients from urban areas that are not endemic for Keshan disease; and a study of New Zealand patients with congestive cardiomyopathy or ischemic heart disease and congestive heart failure.

On the other hand, another study showed no evidence of selenium deficiency in 21 patients with alcoholic cardiomyopathy. A study of 33 hemodialysis patients failed to find a correlation between serum selenium levels, which were often low, and echocardiographic evaluation of left ventricular function. An additional study showed no decrease in intraventricular septal hypertrophy nor increase in skeletal muscle mass in selenium-deficient hemodialysis patients treated with sodium selenite.

There have been a limited number of studies of selenium status in patients with skeletal muscle disorders. Patients with Duchenne muscular dystrophy and myotonic dystrophy have been shown to have low selenium levels. In Duchenne muscular dystrophy, selenium supplementation has no beneficial effect on skeletal muscle strength or cardiac function. In myotonic dystrophy, a case report and subsequent controlled study demonstrated that treatment with selenium and Vitamin E can improve muscle strength, electromyographic abnormalities, and serum CPK. A controlled study of selenium replacement in New Zealand residents with muscular complaints showed no greater effect than placebo.

Cellular events leading to myopathy and cardiomyopathy as a result of selenium deficiency are unknown. Glutathione peroxidase reduction and subsequent oxidative damage to the muscle cell membranes may be important. Low glutathione peroxidase levels, however, have been shown to be present in healthy residents of areas with selenium-poor soil.

Several animal studies demonstrate the existence of other selenoproteins, and it is possible that these are affected in selenium-deficiency states and may play a role in diseases induced by selenium deficiency. In rats, 82% of erythrocyte selenium and 63% of hepatocyte selenium are bound to glutathione peroxidase. However, 20% of heart muscle and only 5% of skeletal muscle selenium are bound to glutathione peroxidase. Evidence suggests that selenium affects the cytochrome P450 system and induces the synthesis of delta aminolevulinate synthase and hemoxygenase.

Controlled studies of Keshan disease prevention by selenium confirmed the hypothesis that selenium deficiency is necessary for development of the disease. Similar studies are needed to elucidate any relationship between selenium deficiency, myopathy, and cardiomyopathy in chronic disease settings. In addition, studies designed to more precisely define mechanisms of muscle cell damage in selenium deficiency may uncover new aspects of muscle physiology and pathophysiology of wide clinical relevance.

Vignette of medical history: Toulouse-Lautrec

Joseph M. Miller, M.D.

Dr. Miller is a retired surgeon from Timonium, Maryland.

Recollections of Toulouse-Lautrec bring to mind a gaily-colored scene of Paris nightlife or a marvelous painting of the Moulin Rouge. An earthy man, he provided his audience with paintings of cancan dancers, models, tarts, and circus performers with swift, sure strokes.

He had the ability to simplify the line and color of a scene to present its quintessence. He was the first major figure in a new art form—the poster—and, in his day, was perhaps better known for his achievements in this medium than in the usual art forms.

Figure 1. Henri Toulouse-Lautrec.
Reprinted with permission from Nagle JJ. *Heredity and Human Affairs.* Saint Louis: The C.V. Mosby Company. 1974; 152.

His artistic nature was not matched by physical size **(Figure 1).** The adult Lautrec was only about five feet tall because of a genetic defect. At times, he was considered an achondroplastic dwarf, but subsequent study has suggested another diagnosis.

Henri Toulouse-Lautrec was born on November 24, 1864, of parents who were first cousins. They were healthy, and a history of dwarfism was not present in the family. Gross deformities were not evident in the neonatal period. A brother died of an unknown cause at the age of one year.

Henri was a frail child, and although he did well in his early school years, his parents withdrew him from school for private tutoring. He fell and fractured his left femur in 1878 and experienced a similar break on the right side one year later.

During his teen years, his legs stopped growing, although his torso was normal. He was a friendly, though short individual. A thick nose, big lips, and a retreating chin gave him unique facial features. He walked with a

waddle and always carried a cane. Unfortunately, his life was shortened by alcohol and syphilis, and he died at the age of 36.

Maroteaux and Lamy first described pyknodysostosis in 1962,[1] and then reported the instance of Lautrec in 1965.[2] These initial descriptions were followed by excellent contributions from Ellmore et al[3] and Sandano, Gorlin, and Anderson.[4] The latter publication is a literature survey of 73 cases in 51 families. The syndrome is characterized by dwarfism, osteopetrosis, partial agenesis of the terminal digits of the hand and feet, cranial anomalies, frontal and occipital bossing, and hypoplasia of the angle of the mandible.

Lautrec was the victim of a disorder belonging to a group of poorly understood congenital anomalies. One pleiotropic gene may account for the multiple phenotypic effects.

An important argument in favor of the autosomal recessive transmission of this disease may be the familial consanguinity noted in the family history. Sandano et al, after a study of their collected cases, concluded, however, that consanguinity may not play a role as its rate did not differ materially from the nonsanguinous type. Their data was compatible with an autosomal recessive mode of inheritance. An increasing number of literature reports in the last decade testify to a greater interest in this genetic disease.

Imaging Case of the Month

A 20-year-old Bolivian man presented for evaluation of a new-onset seizure disorder. He was well until May 1992 when he noted an episode of dizziness, followed by witnessed tonic-clonic activity and subsequent postictal confusion. The occurrence of a similar episode one month later prompted medical evaluation. Apart from the two seizure episodes, he denied any other symptoms. Specifically, there was no history of headache, change in vision, fever, or focal weakness. The physical examination was completely normal, as was the neurologic examination. There was no evidence of papilledema, cardiac murmurs, or neurologic deficits. A head computed tomography (CT) scan was performed at the referring institution **(Figure 1)**. Subsequently, a magnetic resonance imaging (MRI) study was performed **(Figures 2-4)** to better define the abnormality seen on CT.

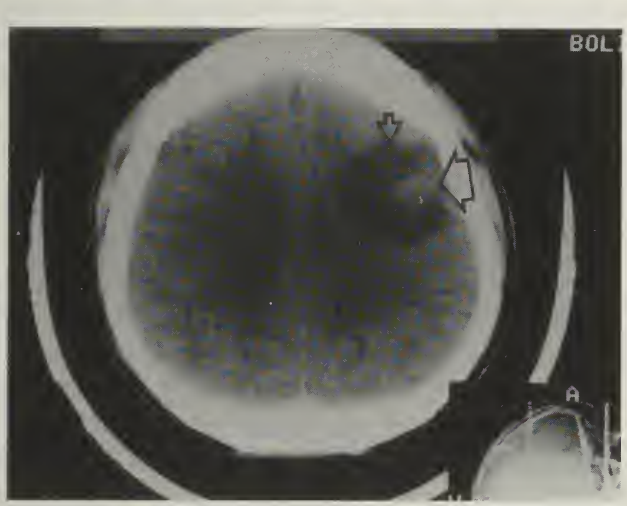

Figure 1.

Figure 2.

Figure 3.

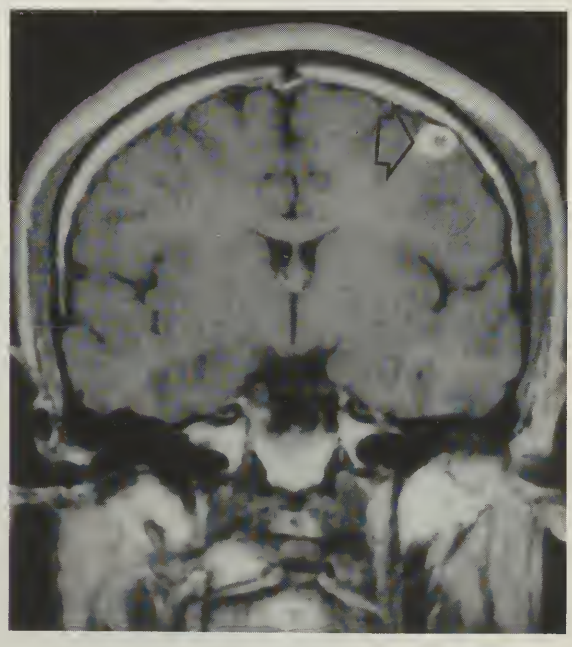

Figure 4.

Parenchymal neurocysticercosis

Figure 1. Head CT (axial section) showing a left frontoparietal lesion (large arrow) with surrounding edema (small arrow).

Figure 2. Head MRI (T_2-weighted axial section) showing significant white matter edema (arrow) surrounding the left frontoparietal lesion.

Figures 3 and 4. Head MRI (axial and coronal sections after administration of gadolinium) showing ring-enhancement of the lesion (arrow) in the left frontoparietal region.

Neurocysticercosis, considered one of the most common parasitic diseases of the central nervous system (CNS), occurs via the ingestion of viable eggs of the pork tapeworm *Taenia solium*, typically found in contaminated uncooked or undercooked food. Once in the digestive tract, the eggs hatch, liberating the embryonic organisms, which then cross the intestinal wall, enter the circulation, and finally localize in tissues such as skeletal muscle, the eyes, and the brain. Tissue cysts tend to form over a two-month period and may remain viable for as long as 10 years. Patients with CNS parenchymal cysts may be asymptomatic until the organisms die, at which time an acute inflammatory reaction occurs within the brain. It is often at this point that patients develop seizures or focal neurological signs. Without therapy, the inflammation eventually resolves, leaving a calcified granulomatous lesion that may serve as a focus for recurrent seizure activity.[1]

The radiographic findings of cysticercosis are somewhat variable. Plain films of the extremities and the skull may reveal small scattered calcifications representing dead cysts. A number of characteristic findings are seen with CT. Nonenhancing low-density regions represent viable cysts with immune tolerance. Hypodense or isodense ring-enhancing lesions with surrounding edema represent the acute inflammatory phase of parenchymal disease, which occurs as the organisms begin to die. Occasionally, diffuse brain edema may be seen in conjunction with multiple enhancing lesions (cysticercal encephalitis). CT may also reveal scattered intraparenchymal calcifications characteristic of destroyed cysts.[1,2] MRI is less useful for the localization of brain calcifications. It is, however, more sensitive than CT and may allow identification of additional viable cysts not otherwise seen on CT.[3] While there is no specific pattern of cysts (patients may have multiple or single lesions), cases with multiple lesions predominate. It may not be possible to radiographically differentiate between neurocysticercosis and other intraparenchymal lesions (such as tumor, tuberculosis, or brain abscess), especially in the setting of a single lesion.[3]

Diagnosis often demands a complete travel history, since the disorder is endemic in many parts of the world, especially Latin America. It is the most common cause of new-onset seizures in adults in Mexico and is a major contributor to adult-onset seizures in Peru.[4,5] Increasing numbers of cases have been reported in the United States due to the rising numbers of immigrants and refugees from developing countries.[6,7] In patients with the possibility of neurocysticercosis, imaging studies (CT or MRI) may help suggest the diagnosis, especially if scattered CNS calcifications are present. The most reliable serologic test is an enzyme-linked immunotransfer blot assay performed on serum. This assay, performed at the Centers for Disease Control and Prevention in Atlanta, has been shown to be 100% specific and 98% sensitive in biopsy-proven cases of

PHYSICIAN AUTHORS WANTED

"Imaging Case of the Month" is a regular feature of the *Maryland Medical Journal.* Coordinated by the Maryland Radiological Society, the cases presented provide a review of a broad range of diseases and pathological processes of interest to a wide range of specialists.

Physicians interested in submitting cases for publication consideration should contact the department editor:

Parenchymal neurocysticercosis

neurocysticercosis, and appears to be the preferred method of making the diagnosis. Sensitivity is reduced somewhat in patients with single enhancing lesions or calcified granulomas.[8] Rarely, brain biopsy may be required for a conclusive diagnosis.

Treatment is advocated, not only to eradicate the organisms, but to reduce the risk of a subsequent persistent seizure disorder.[9] Therapy involves treatment with praziquantel as well as anticonvulsants (if required). Albendazole has also been shown to be effective. Occasionally, steroids are required in settings with progressive, symptomatic parenchymal edema. Usually, these can be tapered rapidly after completion of the cysticidal therapy.[1]

MAIDEN CHOICE MRI
WITYK, GOAD, KORANGY AND ASSOCIATES, P.A.

Introduces

The Patient-Friendly MRI

After more than ten years, MRI (Magnetic Resonance Imaging) has finally become patient friendly.

MRIs continue to be the most desirable method for accurate diagnoses of brain, spine, pelvic, cardiac, TMJ and soft tissue abnormalities.

Maiden Choice MRI achieves the ultimate in patient comfort, without compromising image quality.

If you would like to make an appointment or you need additional information, please contact the healthcare professionals at:

Book Reviews

Miners and Medicine: West Virginia Memories. Claude A. Frazier, M.D., with F.K. Brown. Norman, Oklahoma: University of Oklahoma Press. 1992. 131 pages. $19.95

Don't call me, Saint Peter,
cause I can't go,
I owe my soul to the
company store.

Old mining song.

The termination of Civil War hostilities was almost immediately followed by the opening of the industrial revolution in the United States, when a group of unusual individuals made their mark on the national scene. Warlike and pitiless, they became the strange new soldiers of economic life. America was a paradise for the entrepreneur capitalist because of the laissez-faire political attitude of the federal government, coupled with the votes of easily purchased legislators. Self-interest dominated the lives of this imaginative breed. Some have labeled them greedy because of their enormous financial success. The list is long: Astor, Vanderbilt, Cooke, Gould, Carnegie, Morgan, and Rockefeller. To these, Frazier and Brown have added the many who became the pirates of the coal fields.

Frazier, whose father was a doctor and whose mother was a nurse in the coal camps of West Virginia, tells of his personal experiences with the horrible conditions extant in the coal fields of Appalachia until relatively recent times. The reader may actually envision the appearance of the four horses of the Apocalypse in these areas: war, famine, pestilence, and death. The history of coal mining is a wretched tale without redeeming features. These circumstances existed primarily because of the avarice of company owners who installed a virtual feudal system in the mining areas.

Miners and their families were totally dependent upon the company for wages, homes, food, health care, and education. Contact with the external world was minimal as this aspect, too, was controlled by the corporation.

The century following the Civil War saw the rise of the US coal mining business in order to supply the energy demands of industry, which expanded at a dizzying rate. Coal was first obtained by pick, shovel, and wheelbarrow. As surface mines became barren, tunnels were dug, and tracks laid in them. Initially, cars were pushed along rails, but later they were pulled by mules or ponies. Deep ground penetration produced serious problems occasioned by carbon dioxide (chokedamp) and carbon monoxide and methane (firedamp). Asphyxiation, explosions, and wall collapse were not infrequently seen.

Paid only once a month and frequently in company scrip, miners were eternally in debt. Cash flow was reduced and the company's monopoly on many aspects of a miner's life was tightly maintained. Families lived in wooden houses provided by the company. Cheaply built, these shacks afforded little protection against the cold, damp, and filth. Sanitation was virtually nonexistent; water was obtained from springs as few houses had running water. Outdoor privies dotted the hillsides and served most of the area. Often, these wretched sanitary facilities were in close juxtaposition to water supplies, so that contamination was frequent and noxious.

Another horrible feature characterizing the camps was child labor. Many youngsters were employed as "trapper boys" who opened and closed the trap doors for the animals as they hauled coal cars in and out of the mines. Other children were "breakers" who swung heavy hammers and broke up large pieces of coal. This dirty job blackened their skin and filled their lungs with coal dust.

This aspect of the industry was particularly obnoxious, but the federal and local governments did little to correct the

situation for a prolonged period. Three unsuccessful attempts to control child labor by federal legislation were made in 1916, 1919, and 1933. The acts of 1916 and 1933 were declared unconstitutional, and not until 1941 was such legislation approved by the US Supreme Court. Beneficial change was then the order of the day.

The practice of medicine was difficult in these early years. Few trained physicians wished to work in the camps, so care was provided by self-proclaimed doctors or apprentices. The establishment of medical schools and licensing examinations led to a gradual displacement of yarb (herb) doctors, midwives, and "grannies." Specific medication was often lacking, and reliance was placed on patent medicines. Many of these nostrums contained alcohol or opium, which led to addiction.

The early coal-camp doctor received relatively little training before being licensed. Physicians were hired by the company and paid by assessment of the miners. Fees covered all medical care save deliveries and surgical procedures, for which the doctor was permitted to charge a little more. Frazier's father delivered more than 1,000 babies while practicing in the coal fields, but did not receive payment for 245 of them. Imagine having 24 office visits every day of the year, and then making house and hospital calls. In addition, poor roads made home visits difficult and exhausting.

Seriously ill or injured patients could not be kept at home without risking prolonged morbidity and mortality. For many camp towns, the hospital was a good distance away and could only be reached by a rough wagon or train trip. One of the many coal camp doctors was Henry Hatfield, a future governor, who finally persuaded the West Virginia legislature to establish three public hospitals for miners. Other patients might be admitted, but they had to pay, while lumberjacks, railroad workers, and miners were treated without charge.

Silicosis and anthracosis have claimed the lives of an undue number of miners. One of the more flagrant episodes of silicosis, a practically unsupervised period of injury, occurred during the construction of the Hawk's Nest tunnel. Workers became ill and died, with the death toll being at least 476 during the 18 months needed to complete the project. The problem of anthracosis was much greater in the coal areas, and it has been estimated that at least 365,000 miners were killed or disabled.

Happily, conditions have improved as mines are now well ventilated. New machinery to preclude the back-breaking labor previously involved, self-contained respirators to prevent asphyxiation, and far better medical care are now provided.

Problems still exist in these areas, however, as not all houses have indoor plumbing, and some creeks still contain raw sewage. Adequate medical care in some areas is still lacking, and serious illness or injury necessitates a trip to an urban center for specialized treatment. The coal-camp doctor of the past has disappeared, and, in many areas, modern clinics, up-to-date physician offices, and good hospitals have replaced the old rough-and-ready therapy.

In retrospect, this book will appeal to all who wish to learn about the customs and spirit of these early days in the Appalachian mines. The lore of medicine is not stressed, but readers will appreciate the tremendous difficulties under which the coal-camp doctor worked. The concern exhibited by miners and their families when trouble arrived for others is impressive. To some, the techniques for removing coal from the earth will be interesting and become apparent for the first time. The book is definitely recommended for a pleasant evening of reading.

Travel and Routine Immunizations. A Practical Guide for the Medical Office. Richard F. Thompson. Milwaukee: Shoreham Medical Marketing, Inc. 1993. 96 pages. $12.95.

This publication is another indication of the quantum jump made in international travel management since wind-driven ships were used in the Mediterranean Sea. When east met west at Venice in the middle of the 15th century, travelers and goods were quarantined for 40 days to insure that contagious diseases would not enter the country. Health organizations are still concerned about the importation of infection, but knowledge about their causes and the creation of preventive vaccines have tremendously eased the health threat of traveling.

All travelers abroad from the United States will have similar questions. One most frequently asked is "What immunizations do I or members of my family need?" Requirements vary by country and are subject to change, as are the preparations used to confer immunity. Foreign governments design requirements to protect their own citizens from disease translocation, and travelers, of course, wish to avoid endemic infections.

At the moment, yellow fever is the only immunization that should possibly be required for entry into any country. Cholera vaccination, except under certain circumstances, is not required. Other inoculations may be recommended, but are not required. Health preservation by travelers will demand that certain precautions be taken, however, so some routine vaccines should be given.

This book enables physicians and health care providers in corporate centers to provide reliable information about the necessity and details of immunization. A further purpose is to make recent information readily available to pediatricians

who may be concerned with preventive immunology.

Because a projected itinerary may expose a transient to a completely different health environment, preparations to prevent illness should be made. Thompson gives good advice when he suggests that, ideally, the international wayfarer should see a doctor at least eight weeks before departure time. At that time, the physician should review previous immunizations and arrange an administration schedule that should end well before the projected leaving date.

The review should include

- Country-specific requirements;
- Current advice as to the presence of diseases in the country to be visited;
- Medical problems that might be encountered;
- Dangers of mosquito and tick bites, and how to avoid them; and
- An explanation of jet lag, food and water sanitation, hazards of swimming in fresh water, and first aid measures.

The author states the book will be most helpful when a suggested sequence of steps is initiated:

1. Review the patient's itinerary to help identify the correct immunizations.
2. Complete the International Health Medical Questionnaire.
3. Complete the International Certificate of Vaccination, which the traveler should always carry.
4. Ensure that the itinerant is thoroughly cognizant of the immunizations given.

Misconceptions concerning vaccination contraindications are reviewed carefully. A detailed list of conditions inappropriately regarded as such are discussed fully.

Routine immunizations to be considered for those who travel to other lands or for immunization of children in their early years include

- Diphtheria, tetanus, and pertussis (Adults should have tetanus and diphtheria only)
- Hemophilus influenza, but only for children five years of age and under
- Influenza
- Measles, mumps, and rubella
- Pertussis
- Poliomyelitis (Adults do not need a routine booster dose.)

Immunizations to be considered for all travelers depending on international requirements, local conditions, and length of stay embrace include

- Cholera (Although cholera is a major health consideration in many developing countries, it does not officially require vaccination. In some countries, however, travelers leaving areas in which cholera is endemic may still be expected to show immunization proof upon entering other regions.)
- Hepatitis B (Hepatitis B vaccination is recommended for travelers who expect to live in an endemic area for more than six months, those who may come into contact with local blood, and those who might have sexual contact during their stay.)
- Japanese encephalitis
- Meningococcus
- Plague, but only in in very special instances
- Rabies
- Tick-borne encephalitis
- Typhus
- Yellow fever

Each vaccine is discussed under general information; doses for adults and children; side effects; precautions; compatibility; pregnancy; and special considerations. Pregnant, pediatric, and corporate travelers present particular problems, and plans to avoid complications should be made before departure. Individuals who have AIDS (acquired immunodeficiency syndrome) and those who are positive for HIV (human immunodeficiency virus) are at special risk during travel abroad.

Careful attention must be given to the storage and handling of vaccines to insure that they maintain potency and are not a source of infection. Consummate care will maintain, in good supply, the numerous different vials necessary for a varied practice. An ongoing inventory is the only way to keep pace with the demand.

The book concludes with a resource directory from which further details may be obtained. Manufacturers of all vaccines are identified. Of more than casual interest is the fact that instant access to health regulations of more than 200 countries may be obtained at the place of publication (Shoreham Medical Marketing) through a facsimile (FAX) machine.

The book fulfills its purpose and should be a much used resource for doctors and health care providers who prepare individuals for foreign travel. The instructions are easy to follow and should help considerably in the immunization process.

Julius Preuss' Biblical and Talmudic Medicine. Translated and edited by Fred Rosner. San Hedrin Press: New York. Originally published in 1911, reprinted in translation in 1978, and reprinted in German in 1989. 652 pages.

Ancient books and their knowledge are often available only to professionals, and, therefore, a great literary event occurs when the lore of antiquity is explored and well reported in a modern book. Julius Preuss takes us back through the centuries and gives us a veritable treasure trove of information about ancient Jewish medicine, which will attract medical historians' attention. Written Jewish medical works did not exist in antiquity, but the knowledge was

not lost. Preserved by oral transmission, references to medicine and its practice may now be found in Jewish sacred, historical, and legal literature.

Studies of Biblical and Talmudic medicine had preceded Preuss' work, but they were written by laypersons or physicians unfamiliar with the Semitic language and literature. Preuss was extremely well qualified for this literary venture because he was an excellent doctor and a thorough Semitic savant. Having produced a critical, extensive, and reliable Jewish historical literature summation, he may well be recognized as a prime exponent of Jewish medical intelligence.

A German Jew born in 1861, Preuss was a brilliant scholar who graduated in medicine with high honors from the University of Berlin in 1886. After a short period of practice in his hometown, he returned to Berlin where he became a successful general practitioner. He also matured into a learned Hebrew scholar. This dual preparation eminently qualified him to do the necessary research to write this book.

Ancient Jewish literature begins with the Pentateuch (Torah), and Preuss' studies are based on the Masoretic text of the Bible. In addition, the "oral law" which explains and supplements the Bible was explored. (Oral transmissions were enriched by exegesis and rabbinical ordinances until a collation of this material, the Mishnah, was made at the end of the second century. The totality of the Mishnah, Tofseda (additional Mishnah), and learned digressions is called the Gemora and is the data bank Preuss used to write his book.)

Talmudic medicine began about 2000 BC in the grazing lands between the Euphrates and Tigris rivers. It continued as Abraham and his descendents peopled the Fertile Crescent.

This reliable, comprehensive, and scholarly report reviews the full range of extant medical knowledge including anatomy, diseases and their treatment, sex, diet, obstetrics, mental health, and legal aspects. The 19 chapters are devoted to the main topics, and each division contains footnote references to the sources of the material under discussion.

Chapter-end references are also present, and, although not exhaustive, they have depth. A marvelous index written by Robert J. Milch cites the location of relevant material in the Hebrew Bible, and Apocrypha and Pseudepigrapha, the New Testament, and the Talmud. A subject index concludes the book.

Vignettes are frequent throughout the text. References to diseases and their treatment are explicit. In 2 Kings 20, we read that Hezakiah was extremely ill with a severe cutaneous infection. Isaiah treated the area by placing a lump of figs on the site. This episode was perhaps the forerunner of infections therapy with the proteolytic enzymes that became popular about 2,500 years later.

Remarkable also was recognition of the genetic transmission of hemophilia through the female as mentioned in the Babylonian Talmud written in the third century and referred to in subsequent texts. The Talmudic decree that the sibling of two brothers who had died of bleeding after circumcision need not be circumcised is codified by all rabbinical authorities.

This book is an unsurpassed fount of historic Jewish medicine. Comprehensive in scope and impeccable in scholarship, it demonstrates that early Hebrew doctors had considerable insight into disease and healing. Medical historians, Biblical students, medical practitioners, and medical students will appreciate reading this excellent book. Every medical library should possess a copy.

Even when only a short distance into the volume, the reader may feel like Aladdin when he rubbed his wonderful lamp to reveal new delights. Candidly, the book will add nothing new to modern medicine, but it will instill a sense of admiration for those ancient health providers who learned so much from so little and provided some of the roots of modern medicine.

One studies Latin to learn the English language, and, in a parallel sense, the work of these early practitioners should be read to understand present day medicine to a greater extent.

The 1911 edition was reprinted in 1989 in German. Readers of the language might gain a greater rapport with the contents if they read the original text and experience the idiom of the time.

JOSEPH M. MILLER, M.D.
Timonium, Maryland ■

Forty years ago

Forty years is a fascinating interval. It can be seen as a generation—four decades of change and advancement: new medications, new diagnostic tools, and new techniques and procedures.

On the other hand, human nature may not have changed very much. *Plus ça change, plus c'est la même chose.*

Excerpts from the past are selected to remind us of our limitations. Some limitations of the past may seem silly in today's scientific light, but others may point out the ignorance of today and the need to mush on with some humility.

1953:
Nixon was in office, a heartbeat away from the presidency.
Krebs was a Nobel Prize winner.
Australia beat the United States to retain the Davis Cup.
The CPC reprinted here illustrates the easy recognition and helplessness in management of kidney disease. How will a CPC of a 1993 AIDS (acquired immunodeficiency syndrome) patient seem to readers of 2033?

JOHN W. BUCKLEY, M.D.

*1953: Clinical Pathological Conference**

Reprinted from the *Maryland State Medical Journal* 1953; 2(1): 33–37.

W.B.; colored male, age 24; autopsy #5862; chart #31427. Admitted: January 6, 1950; Died: January 23, 1950.

Clinical history

This patient was a 24-year-old porter who was admitted to the University Hospital on January 6, 1950, with complaints of drowsiness and disturbances of vision. His illness is said to have started in September, 1949, when he became so sleepy that he could not work efficiently. Sleepiness came on at any time and persisted until his admission to the hospital. He stopped work about December 29, 1949, and at the same time began to vomit and complain of blurring of his vision in one eye. Nocturia was described for about two months, and his appetite had been failing for the same time.

The past history was negative with the exception of the recognition of hypertension in 1942, when he was refused admission to the army. There was no history of tonsillitis, scarlet fever, or urinary tract infection.

Physical examination was recorded as follows: The patient is a well-developed, slightly undernourished Negro male of

Presented at the Annual Meeting of the Medical and Chirurgical Faculty of April 29, 1952, by the University of Maryland, School of Medicine (Transactions *1952).*

24, who is lying flat in bed in a lethargic state. He responds sluggishly to questioning, but dozes off during examination. The breath is foul, but there is no odor of ammonia. The skin is dry and turgor is poor. There is no striking evidence of weight loss, and muscular development is good. There is no lymphadenopathy. The hair and scalp are negative. The pupils react, and ocular movements are normal. There is slight periorbital edema. Ophthalmoscopic examination reveals normal nerve heads. The retinal arteries are markedly tortuous and constricted, with many flame shaped hemorrhages of varying sizes. There are a number of scattered yellowish to white fluffy exudates. The nasal septum is in the midline. The sinuses transilluminate well. The oral mucous membranes are dry. The teeth are stained, there is moderate pyorrhea. The tonsils are small. The trachea is in the midline. The thyroid is not palpable, and there is no cervical adenopathy. The chest expands well, and respiratory rate and rhythm are normal. The lungs are resonant, and breath sounds are vesicular. A moderate number of medium rales are audible over both lower lobes. The cardiac outline is normal. The sounds are regular with rate of 100. There is a gallop at the apex, and the first sound is followed by a systolic murmur which is not transmitted. The second aortic sound is accentuated and split. Blood pressure is 260/160. The abdomen is soft. The liver edge is palpable about one inch below the costal margin. The kidneys and spleen cannot be felt. Genitalia are normal, and rectal examination is negative with a small, nontender prostate gland. The extremities are negative with no evident thickening of peripheral arteries.

Throughout his stay in the hospital, the patient's urine showed constant specific gravity varying between 1.010 and 1.012. Large amounts of protein were present in all specimens, estimated at 8 grams per liter. Microscopic hematuria was present in half the specimens examined. Hyaline and granular casts were also described. The stool contained a trace of blood on chemical examination. Phenolsulfonphthalein excretion was less than 5% in one hour. Hemoglobin was 10.8 gm or 76%. The leukocyte count was 8,100 with a normal differential formula.

On the morning after admission, blood urea nitrogen was 150 mgm. Blood sugar was 88 mgm and the CO_2 combining power was 49 vol per cent, or 22 mEq per liter. The serum chloride was 76 mEq. The plasma protein was normal. On January 10, 1950, the blood urea nitrogen had risen to 164 mgm and the serum chloride was further depressed to 63 mEq. The blood CO_2 combining power had risen to 58 vol per cent, probably because of continued vomiting.

After intravenous administration of sodium chloride and glucose, the blood urea nitrogen fell to 170 mgm, but later rose to 188, and terminally to 260 mgm. The serum sodium, which was depressed to 109 mEg on January 12, rose to 123 on January 21. However, the serum potassium, which was 3 mEq on January 10, rose terminally to 6.9 on January 21.

X-ray of the chest, which was taken on January 6, 1950, was normal. There was no demonstrable cardiac enlargement. The electrocardiogram showed some nonspecific abnormalities including depression and arching of the ST segment in Lead 2, with late inversion of the T waves in Lead 1, 2, and 3.

The patient continued to go downhill in spite of therapy. An attempt was made to give him the so-called Kempner rice, fruit, sugar diet, but this was not tolerated because of continued vomiting. Intravenous feeding with glucose was continued until death with efforts at correcting uremia and electrolyte balance by administration of sodium chloride. The patient died on January 23, 1950, at 4:30 a.m., after continued stupor developing into coma. Terminally, uremic frost was observed.

Dr. T. Nelson Carey: The patient whom we are to discuss this morning does not present a very obscure clinical picture but serves quite well as a teaching problem.

The man was a Negro of 24 who was admitted to the University Hospital, January 6, 1950, and died January 23. He was a porter, and at the time of admission complained of drowsiness with some disturbance of vision.

I believe that we all agree that this patient was uremic and that he died of that abnormality. Uremia may be defined as a symptom complex or syndrome which arises from retention within the body of those constituents which are normally excreted in the urine. For years there have been many attempts to explain the uremic state. It is obviously not caused by retention of urea, as this material is almost completely harmless. Some uremic patients are ill because of acid retention, though this man was not acidotic. Acidosis, when present, is caused by retention of acid phosphate. Usually the uremic individual tolerates acidosis quite well, even though it produces the type of dyspnea known as Kussmaul breathing. During the last seven or eight years since the chemistry of potassium has been more closely followed, it has been learned that the uremic individual commonly has elevation of this element in his blood plasma, and that potassium retention may be an important factor.

Actually, however, the picture of uremia is probably caused by a mixture of measurable abnormalities and others that cannot be directly determined. Anemia may be an important side effect, as the uremic state depresses the bone marrow's ability to manufacture blood.

In attempting to come to a conclusion as to the cause of our patient's uremic state, several causes of nitrogen retention may be dismissed without difficulty. The so-called prerenal azotemia

associated with pyloric obstruction and vomiting, the nitrogen retention following gastrointestinal hemorrhage, and the so-called lower nephron nephrosis that is associated with shock, transfusion reactions, and bichloride poisoning all may be dismissed without discussion. Another very important group of diseases of the kidney that may be associated with uremia and occasionally with hypertension are those in which the lower urinary passages are obstructed, either as high as the kidney pelvis or as low as the urethra. This group may be called the "obstructive uropathies." It is a most important group of diseases because the relief of obstruction may either improve or cure the illness. Ureteral stones, prostatic hypertrophy, ureteral obstruction by carcinoma in the female, must all be considered, and proper studies instituted. Cystoscopic examination and retrograde pyelography was not done on our patient, though I doubt very much if any pathology would have been discovered.

I believe that we may narrow our search down to uremia that is characterized by disease of the kidney itself. A number of these can be ruled out without much discussion. Pyelonephritis is a common cause of uremia. It is most important because it is preventable in its early stages. It is characterized, of course, by infection and obstruction of the kidney pelvis and ureters. It is occasionally associated with hypertension. Almost always, the microscopic urine examination shows polymorphonuclear leukocytes. It is more common in women than in men. I believe that our patient showed very little to suggest this disease, as the microscopic examination of his urine did not demonstrate pus, and there is nothing to suggest obstruction of urine flow.

Polycystic disease of the kidneys usually becomes evident at the age of 50 or 55. As a rule, the kidneys are quite large and easily palpable.

Diseases of the kidney such as tuberculosis, multiple infarction, and amyloid can cause uremia, but almost invariably the blood pressure is quite low and I believe that they may be eliminated from serious consideration.

I believe that we must narrow our differential diagnostic discussion to the differentiation of glomerular nephritis and malignant hypertension or arteriolar sclerosis. The choice is a very difficult one to make satisfactorily, as at the end of the patient's course, the pictures may be identical.

You will remember that the physical examination described edema of the orbits in spite of vomiting and dehydration. This and the large amount of protein in the urine tempts me to suggest glomerular nephritis. We know that the precipitating streptococcal infection may be also forgotten in the patient's past history, and we also know that uremia is more usually the end result of glomerular nephritis than it is of hypertension as such.

Actually, any attempt at differentiation of these two diseases in the terminal state is of purely academic interest. Terminal uremia from either cause cannot be cured. There is also very serious doubt that recognition of the illness several years before would have allowed it to be treated in a reversible state. During the past few years, total adrenalectomy has been attempted on patients with malignant essential hypertension, and some are said to be benefited decidedly, even though they accept the inevitable Addison's Disease.

In coming to a definite diagnosis, I must confess to the audience that I discussed this patient once before in a clinical pathological conference for the senior class of the University of Maryland School of Medicine. At that time I made a diagnosis of chronic glomerular nephritis with uremia. I now know that that was a wrong diagnosis, but in the interest of consistency I must make it again. Dr. Gardner Warner will tell you the proper diagnosis and discuss the picture for you.

Dr. C. Gardner Warner: *Anatomical Diagnosis*: Arteriolar nephrosclerosis, necrotizing; diffuse hyperplastic arteriolar sclerosis; left ventricular hypertrophy; focal myocardial fibrosis; fatty degeneration, myocardium; serifibrinous pericarditis; pulmonary edema.

The body is that of a well-developed, well-nourished, young colored male. External examination shows little of note. The peritoneal cavity contains no excess free fluid. The liver is somewhat enlarged. The other abdominal viscera are normally disposed. About 200 cc of serous fluid are seen in each pleural cavity. Old fibrous adhesions are found between the upper lobe of the right lung and the chest wall. The pericardial sac is distended; it contains about 500 cc of yellowish fluid. The epicardium is dulled by fine strands of fibrin. The heart weights 600 gm. The wall of the right ventricle measures 5 mm in thickness and that of the left ventricle 22 mm in thickness. The valves appear normal. Beneath the mural endocardium, yellowish flecks characteristic of fatty degeneration are noted.

The kidneys, right and left, weigh respectively 150 and 200 grams. The capsules are slightly adherent and the cortical surfaces are somewhat granular. Small areas of hemorrhage are seen beneath the capsules and in the cortices of both kidneys. The principal histologic changes in the kidneys are those observed in the arterioles. The walls of the afferent glomerular capillaries are quite thick; they are acidophilic and smudgy in appearance. Similar focal changes are noted in the capillaries of the glomerular tufts. Hemorrhage is seen in some of the subcapsular spaces. Some of the tubules are atrophic and collapsed; others are dilated and contain hyalin and red cell

casts. The arterioles in other organs, notably the pancreas, show changes similar to those seen in the kidneys.

This is a case of primary or essential hypertension.

Discussion

Primary or essential hypertension has been so called because there seems to be no proven primary lesion. It has been clinically divided into benign and malignant types on the basis of duration and rapidity of progression. For a long time, it has been recognized that renal arteriolar sclerosis is an almost constant postmortem finding in essential hypertension. The arteriolar sclerosis is often, but not always, a generalized change. It is seen in the spleen, pancreas, adrenals, brain and heart, but it is only in the kidneys that this hyperplastic arteriolar thickening and hypertension seem to have a close correlation. There is still some uncertainty as to whether it is a cause or effect relationship.

The importance of renal vascular changes in hypertension have been pointed out and emphasized by Goldblatt and others, who have demonstrated that ischemic renal tissue releases a pressor substance into the circulation, which by its constrictive action on peripheral vessels, produces hypertension.

Whether the process is benign or malignant, it seems that the pathogenesis is fundamentally the same. The malignant form occurs particularly in young adults, especially the Negro male, as in this case. It is more rapidly progressive and has severer lesions, but follows the same pattern of arteriolar nephrosclerosis and cardiac hypertrophy, with renal, rather than cardiac failure. Pathologically, the malignant variety is characterized by a smudgy hyalin necrosis of small arteries and afferent glomerular arterioles, with small hemorrhages from severely damaged vessels. This necrotizing arteriolitis may produce some inflammatory cellular response. It may extend and involve glomerular capillaries with hyalin thrombosis or capsular hemorrhages. The pathologic findings may be modified somewhat when a benign hypertension has a superimposed malignant terminal phase. In the latter case, varying chronic changes, with hyalinization, glomerular atrophy, and tubular collapse are present, in addition to the patchy necrotizing arteriolitis and hemorrhage.

In the case under consideration, such must be the final conclusion. The eight-year history of hypertension, a 600 gm heart, widespread hyperplastic arteriolar changes, granular kidneys with chronic glomerular and tubular changes, make the process one of relatively slow evolution.

The case is, therefore, one of benign essential hypertension and nephrosclerosis with a terminal malignant phase and death by renal failure.

We diagnose sleep disorders where they occur. At home.

Many patients suffering from sleep disorders can't, won't, or are simply unable to come in for a sleep study. That's a problem for them and for you.

Fully accredited by the American Sleep Disorders Association, Shady Grove's labs are among the area's most sophisticated. And now, to obtain diagnostic data needed to treat patients with sleep disorders, we've established an effective in-home program. For the patient, costs are usually covered by insurance.

Into the home environment, almost anywhere in Maryland, we bring the essential resources of a well-equipped lab. Our technology includes nine-channel recorded and reviewed monitoring, covering EEG, respiration, leg movement, and tracheal sound.

Studies are performed by specially trained sleep technicians who work under the direction of Registered Technicians. You can count on receiving a full report within 72 hours of the study, with interpretation by a board-certified sleep specialist physician. When it comes to diagnosing sleep disorders, rest assured, we do some of our best work...at home.

In-home studies can be diagnostically as accurate as those conducted in a laboratory setting. We'd be pleased to show you why. Just call us at 301-251-5905 and we'll send you the recent ASDA position paper on in-home studies, and we would be pleased to discuss its appropriate clinical use.

Medical Miscellany

Med Chi's sister—the Kanagawa Prefectural Medical Association

The Maryland Delegation to the American Medical Association (AMA) was pleased to have the opportunity to meet with Ryohei Kawaguchi, M.D., during the AMA annual meeting in Chicago, June 11-17, 1993. Dr. Kawaguchi is president of the Kanagawa Prefectural Medical Association in Japan.

Figure 1. Hiroshi Nakazawa, M.D., chairperson, Public Relations Committee, and Ryohei Kawaguchi, M.D., president, Kanagawa Prefectual Medical Association, Japan, address members of the Organization for State Medical Association Presidents at the AMA annual meeting.

On June 11, Dr. Kawaguchi attended a meeting of the Organization for State Medical Association Presidents, at which he compared and contrasted the health care systems of Japan and the United States. Hiroshi Nakazawa, M.D., Med Chi Public Relations Committee chairperson, served as host. On Saturday evening, Dr. Kawaguchi attended the AMA international dinner at the Ritz Carlton Hotel.

During the visit, Dr. Kawaguchi presented Joseph Snyder, M.D., Med Chi president, with a cloisonné plate. Cloisonné is the tedious work of enamel known in Japan as *shippo*, meaning "seven heavenly treasures." Derived from the Sanscrit, *septratuna*, the treasures are gold, silver, emerald, agate, coral, crystal, and pearl. Cloisonné enamel is an exquisite art form, of which Japan is understandably proud. Dr. Kawaguchi's beautiful gift is on display in the CEO's office at the Med Chi Faculty Building.

Since 1980, Maryland has had a sister state relationship with the Kanagawa Prefecture in Japan. The prefecture sponsors visits of medical services study groups to various institutions in the United States to review medical systems, meet with physicians and other health care professionals, and promote goodwill within the medical community. In 1991, Med Chi hosted a delegation of Japanese physicians and dentists that was led by Dr. Kawaguchi. At that time, Med Chi signed an agreement for cooperation, friendship, and exchange. A commemorative collage detailing the Maryland-Japan sister state relationship is on display outside Osler Hall in the Med Chi Faculty Building. ■ *V.S.*

Figure 2. L to R: Joseph Snyder, M.D., Med Chi president; Hiroshi Nakazawa, M.D., chairperson, Public Relations Committee; and Ryohei Kawaguchi, M.D., president, Kanagawa Prefectual Medical Association, at the AMA annual meeting.

Russian medical personnel visit Med Chi

Figure 1. Dr. Hrehorovich accepts a gift on behalf of Med Chi from the Russian Delegation.

The Medical and Chirurgical Faculty of Maryland (Med Chi) enjoyed the pleasure of hosting the Medical Personnel Delegation from Russia on June 28, 1993. The delegation comprised 19 Russian citizens and included physicians, dentists, nurses, health administrators, and government officials.

The group received a tour of the Med Chi Faculty Building, and the function of each department within the medical society was described. Victor R. Hrehorovich, M.D., editor of the *Maryland Medical Journal* and chairperson of the Committee on Scientific Activity, served as host and led the Russian delegation in a discussion on health care delivery in the United States. Dr. Hrehorovich fielded questions on medical insurance, malpractice, and cost of health care services. Angus Everton, J.D., Med Chi legal counsel, gave a brief overview of the American legislative process and described the medical community's role.

As a gesture of goodwill and friendship, the Russian delegation presented Med Chi staff with handcrafted works of art. These items will be treasured. ■ *V.S.*

Figure 2. Russian Delegation gathers in Osler Hall during their visit to the Faculty building.

WELCOME!

The Medical and Chirurgical Faculty of Maryland welcomes the new members listed below. They join an organization with a 194-year history of dedicated service to improving the health and welfare of the people of Maryland. With the help and expertise of longtime members and the participation and input of new members, Med Chi can continue its proud tradition of ensuring quality health care.

Goals and objectives for 1993-1994

- ***Lobby for health care legislation.*** This year, more than ever, the auxiliary will keep members informed about upcoming legislation and will be prepared to mobilize members to lobby for legislation that the auxiliary, in conjunction with Med Chi, aims to influence. The auxiliary is committed to securing legislation that not only protects doctors, but provides the best possible health care for all.
- ***Aid in the fight against family violence.*** This year, the state auxiliary, with the help of the county auxiliaries, plans to develop and implement a pilot program in conjunction with the Maryland Network Against Domestic Violence. The aim of this program is to provide spouse-abuse literature in every hospital emergency room in Maryland.
- ***Increase breast cancer awareness.*** In addition to the many auxiliary efforts, the county auxiliaries are asked to make arrangements for the display of billboards promoting breast cancer awareness in their counties. The more people we can reach, the more lives we might save.
- ***Develop teen education programs.*** The county auxiliaries, with help from the state or national auxiliary, are encouraged to create a program aimed at teenagers. The program can reflect the interests of the county auxiliary or a need in the community.
- ***Increase membership.*** Each county auxiliary should make an effort to reactivate past members, refresh nonmembers, and recruit new members. It is also important that we keep in touch with current members and let them know we value their work—they are our best ambassadors.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

First lady asks for physician input to ensure meaningful reform

Hillary Rodham Clinton pushed all the right buttons at the AMA Annual Meeting -- a strong indication of the Association's success in influencing the outcome of the president's reform proposal.

"Her appearance is testimony to her understanding of the critical role physicians will play if system reform is to succeed," said AMA Executive Vice President James S. Todd, MD.

In a 50-minute speech to the AMA's House of Delegates, Mrs. Clinton asked the Association to continue its input into the White House workings on reforming the health system. In return, she promised relief from administrative hassles, limits on malpractice suits, and release of utilization review and "government second guessing of medical decisions."

Mrs. Clinton praised the Association for its extensive input into the reform process.

"I am deeply grateful on a personal level that members of the AMA leadership spent invaluable time coming to meeting after meeting, day after day, sharing their ideas, reacting to ideas at the White House," she said. "And of course, in the course of that, we learned we had many common goals and objectives."

These common interests were notably similar to those in Health Access America, the AMA's reform proposal. She promised universal coverage, a comprehensive benefits package, community rating and free choice.

"We will have not just choice for patients as to which plan they choose to join, but choice for physicians as which plan they choose to practice with, including the option of being part of more than one plan at the same time."

She sympathized with physicians over government bureaucracy, saying, "We have to simplify and eliminate the burden from regulation created under CLIA." She also said the plan will "offer a serious proposal to curb malpractice problems."

AMA Trustee Nancy W. Dickey, MD, summed up the first lady's speech by saying, "She held out a hand in partnership."

Once the president's plan is unveiled sometime within the next several months, Dr. Todd said the AMA will not take a position until it has an opportunity to see the specifics of the proposal.

The Association will conduct an all-physician mailing giving a detailed AMA analysis of the plan after it is released.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Physicians: Time to take action

Physicians, as individuals and as a group, can play a key role in health system reform. Efforts of organized medicine will be tested as never before. Your medical society is the best place to start. It will already have plans to respond to the Clinton plan. Your society will identify key state and federal representatives. And it will provide information on political positions, voting records and office addresses. Here are some suggestions from the AMA:

• *Stay informed.* Shortly after the release of the Clinton plan, you will receive a comprehensive summary and analysis from the AMA. The summary will include the implications of the Clinton plan for your practice and your patients.

• *Know your elected officials.* Establish a relationship with your senators and representatives. Introduce yourself as a physician and a constituent. Write to them or fax your messages. Ask to meet to discuss health reform issues and what it means to your patients. To telephone senators and representatives in Washington, D.C., call (202) 224-3121. Ask for your senator or representative by name.

• *Get your message across.* Use your own words and experiences. Caring for people is what health system reform is all about.

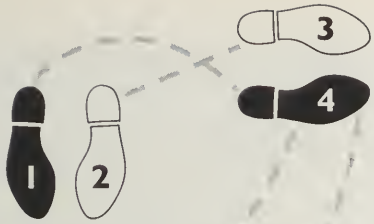
AMA-led campaign opposes enterprise liability

The Clinton administration reportedly has backed away from its intention to propose enterprise liability, after an AMA-led campaign advised that the profession would not consider it an "acceptable alternative" to real tort reform.

The AMA joined with specialty and state medical societies to shift the debate back to serious tort reform.

"We are pleased that the administration is reportedly considering reforms that include limits on awards for non-economic damages and attorneys' fees. Legal fees and administrative costs eat up 60 percent of patient compensation," said AMA Executive Vice President James S. Todd, MD.

Real tort reform fairly compensates injured patients, reduces costs, eliminates windfall judgments, and assures quality care. It also caps non-economic damages, limits lawyers' fees and staggers large awards.



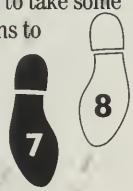
AMA success: IRS withdraws qualifying rules

IRS' withdrawal of potentially troubling proposed pension rules is a significant AMA regulatory victory; this comes as the result of AMA coalition lobbying and legal work done jointly with several national specialty societies during the past three years.

The proposal could have created enormous pension qualification problems for hospital-based physicians by requiring them to provide pension plans for hospital staff under their clinical supervision.

IRS' action means that hospital-based physicians who clinically supervise hospital staff cannot be fined for not providing pension arrangements, nor must they dismantle their existing pension plans.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

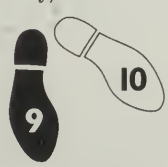


Leading is easy when you know the right steps.

Interactions
Medical Staff Leadership Conference on Managing Change

October 1-3, 1993 Naples, Florida

We can't dance around the issue any longer. Health system reform is occurring at a fast pace. And it's going to take some fancy footwork for physicians to maintain autonomy and control within their practices.



Master the moves that will help you excel in this environment by attending the fourth annual Interactions Medical Staff Leadership Conference: Managing Change. Sponsored by the American Medical Association (AMA), in cooperation with the Medical Association of Georgia and the Florida Medical Association, this comprehensive three-day conference is designed specifically for new and experienced medical staff leaders.

Physician leaders will benefit by:

- Learning how to hone their leadership skills
- Gaining a greater understanding of health policy and medical practice issues
- Acquiring the knowledge and tools to deal with the changes surrounding health system reform

So lead, don't follow. It's easy, when you know the right steps. For more information or to register, call **800 621-8335** now!

Physicians dedicated to the health of America

So Who's Got Money To Burn These Days.

American businesses watched 22 billion dollars in unpaid receivables go up in smoke last year. How much money are you letting vanish into thin air?

Before your unpaid receivables start stacking up, call I.C. System. We're endorsed for debt collection services by more than 1,000 business and professional associations nationwide, including yours. In fact, every month we collect millions for our clients.

Don't get burned by unpaid receivables. Call I.C. System today.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, Maryland 21205 (410-955-2959).

2nd annual update on obstetric anesthesia plus an optional fiberoptic airway management workshop, at the Hyatt Regency Inner Harbor, Baltimore, Maryland. 12 Cat 1 AMA/PRA credits. Fee: $275 physicians; $175 CRNAs; $75 residents and fellows. **Aug. 21–22**

Pediatrics for the practitioner—Update 1993. Cat 1 AMA/PRA credits available. Fee: TBA. **Sept. 9–10**

7th annual core content of emergency medicine: A comprehensive review, at the Marriott Hotel, Baltimore-Washington International Airport, Baltimore, Maryland. Cat 1 AMA/PRA credits available. Fee $995. **Sept. 10–16**

22nd annual diagnostic ultrasound in gynecology and obstetrics and abdomen, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 16.5 Cat 1 AMA/PRA credits. Fee: physicians: 3 days, $400; 2 days, $300; 1 day, $150. **Sept. 17–19**

Rising to the challenge: Crisis intervention in the critical care setting. Cat 1 AMA/PRA credits available. Fee: $75. **Oct. 4**

19th annual topics in gastroenterology and liver disease. Cat 1 AMA/PRA credits available. Fee $495 physicians; $250 residents and fellows. **Oct. 6–8**

35th annual Emil Novak memorial course. 45 AMA/PRA credits; 53 ACOG cognates. Fee: $675 physicians; $475 residents, fellows, and allied health professionals. **Oct. 18–23**

Diabetic retinopathy. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 29**

Practical management of the uveitis patient. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 30**

Ethics and politics related to clinical trials. Cat 1 AMA/PRA credits available. **Nov. 3–4**

Progress in pediatrics. 11 Cat 1 AMA/PRA credits. Fee: $140 physicians; $80 residents and fellows. **Nov. 5–6**

Update on sinusitis. Cat 1 AMA/PRA credits available. **Nov. 8**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, Maryland 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Cardiovascular risk factors in the elderly: Medical and pharmacologic management, at the Baltimore Grand, Baltimore, Maryland. 7 Cat 1 AMA/PRA credits. Fee: $60 physicians. Info: Reba Cornman, 410-706-4327. — **Oct. 5**

Miscellaneous meetings

Imaging the augmented breast, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Sept. 2**

1993 Med Chi semiannual meeting, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Vivian Smith, 410-539-0872 or 800-492-1056. Fee: Free for Med Chi members. — **Sept. 10–12**

The decade of the brain: An international conference, sponsored by the George Washington University, at the Omni-Shoreham, Washington, DC. 28 Cat 1 AMA/PRA credits. Fee: $550 physicians; $330 residents and fellows; $250 other health professionals. Info: John F. Vargo, 202-994-4285. — **Sept. 11–14**

5th annual trauma conference, sponsored by the Peninsula Regional Medical Center, at the Sheraton Ocean City Resort and Conference Center, Ocean City, MD. Info: Darlene Kwiatkowski, 410-543-7328. — **Sept. 16–17**

14th international congress of lymphology, sponsored by the International Society of Lymphology (ISL). Part 1: "Frontiers in Lymphology" at the Hyatt Regency, Baltimore, Maryland. Part 2: "Lymphology in 1993" at the Ramada Renaissance Techworld, Washington, DC. Info: Grace Wagner, Program Coordinator, 602-626-6118. — **Sept. 20–26**

Congenital heart disease in adolescents and adults, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Sept. 27–29**

Interventional echocardiography: Transesophageal, exercise, pharmacologic, and intravascular, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Sept. 30–Oct. 2**

International liver symposium, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 14 Cat 1 AMA/PRA credits. Fee: $350. Info: Hattie Johnson, 202-687-8735. — **Oct. 1–3**

Clinical cardiac electrophysiology, pacemakers, and cardioverter-defibrillators, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 4–7**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Oct. 7**

Gastroenterology board review course, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 42 Cat 1 AMA/PRA credits. Fee: $650 physicians; $500 residents and fellows. Info: Daniel E. Reichard, 202-994-4285. — **Oct. 9–13**

Miscellaneous meetings (continued)

Medical oncology board review course, sponsored by the George Washington University, at the Ritz-Carlton, Pentagon City, Virginia. 38 Cat 1 AMA/PRA credits. Fee: $695 physicians; $500 residents and fellows. Info: John F. Vargo, 202-994-4285. **Oct. 9–13**

Clinical applications of doppler and transesophageal echocardiography, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. **Oct. 14–16**

New techniques and concepts in cardiology, sponsored by the American College of Cardiology, at the Hyatt Regency Hotel, Washington, DC. 16 Cat 1 AMA/PRA credits. Info: 1-800-257-4739. **Oct. 21–23**

Nuclear cardiology: A case study approach, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. **Oct. 21–23**

Managed Eye Care: Paradigms and Pathways

Allan D. Jensen, M.D., secretary for federal affairs of the Board of Trustees of the American Academy of Ophthalmology, brings to Med Chi members' attention a national invitational conference for physicians and practice administrators which details the history and success of Managed Eye Care (MEC) of Maryland—**"Managed Eye Care: Paradigms and Pathways."** MEC currently manages total eye care for more than 250,000 people in Maryland, Virginia, and Washington, DC.

The conference, sponsored by MEC Health Care, Inc. and *InSight Reports*, is a hands-on program for those who develop and manage all phases of this eye care network. It will be held October 23, 1993, in Baltimore. Watch these pages for more details.

PHYSICIAN'S RECOGNITION AWARD

During May 1993, the physicians listed below received the American Medical Association (AMA) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

July, 1993

Selected Communicable Diseases in Maryland in 1992

This summary describes the epidemiology of selected communicable diseases in Maryland in 1992. Only cases with onset of illness in 1992 were included. In addition to the routine physicians' reporting, an ongoing review of laboratory reports with investigation of patients whose test results showed evidence of a reportable disease added to the number of cases of amebiasis, gonococcal infection, Haemophilus influenzae disease, viral hepatitis, legionellosis, Lyme disease, malaria, meningococcal disease, nontuberculous mycobacteriosis, Rocky Mountain spotted fever, salmonellosis, shigellosis, and syphilis. Death certificates from the Department of Health and Mental Hygiene Center for Health Statistics that listed a communicable disease as a cause of death were counted if confirmed by investigation.

In the following report, the number in parenthesis after the name in the title of each disease indicates the number of cases in Maryland in 1992. Below the disease name are the incidence rates in Maryland and in the United States. The rates in Maryland are based on the 1992 population projections (Maryland Office of Planning. Population Projections. Individual Years, 1980 - 1995. Age, Sex and Race. Report 5A - Total. June 1990). The incidence rates in the United States are based on the 1992 population projection, obtained from the U.S. Bureau of the Census, and the cumulative number of cases reported to the Morbidity and Mortality Weekly Report (MMWR) system in 1992 (CDC. MMWR 1993, Vol.41, Nos. 52 & 53).

We are grateful to the physicians, hospitals, and laboratories for reporting communicable diseases. We appreciate the cooperation of the communicable diseases coordinators in the local health departments and the hospital infection control practitioners for investigating many cases and collecting additional pertinent information.

BOTULISM, INFANT (1)

0.02/100,000 (U.S. 0.2/100,000)

Botulism was confirmed by culturing *Clostridium botulinum* and demonstrating type B toxin in the stool of a 24-day-old boy who had been fed infant formula. After hospitalization and treatment the patient fully recovered. The source of infection was not identified.

CHOLERA (3)

0.06/100,000 (U.S. 0.04/100,000)

One case of cholera occurred in May in Anne Arundel County in a person who had eaten fish in Peru shortly before leaving the country. Another case was reported in June in Prince George's County in a patient whose illness had started in El Salvador after consuming raw clams. Both cases were confirmed by culturing toxigenic *Vibrio cholerae,* serogroup O1, serotype Ogawa. The patients were not hospitalized and both recovered. A third case occurred in September in a 9-month-old boy from Canada who had mild diarrhea shortly before the trip to Charles County to visit relatives. Twenty-four hours after arrival he was hospitalized for gastroenteritis with profuse watery diarrhea and dehydration. The patient was treated and discharged 4 days later. *V.*

cholerae, serogroup O1, serotype Ogawa, was isolated from the stool. The isolate was toxin-positive by polymerase chain reaction. During the investigation for the source of infection it was disclosed that the patient's father was working in an enteric microbiology laboratory; he had been vaccinated against cholera and denied any recent handling of *V. cholerae* bacteria. Additionally, the host family had just returned from Pakistan, where all 5 members (2 adults and 3 children) had diarrhea. However, serological testing for vibrocidal and antitoxin antibodies showed that one person had a slightly positive Inaba titer, 2 had positive titers which could not be distinguished from antibodies to E. coli heat labile enterotoxin, and 2 had negative antibody results.

ENCEPHALITIS, PRIMARY AND POSTINFECTIOUS (22)

0.5/100,000 (U.S. 0.3/100,000)

The incidence rate of 0.5 per 100,000 population in 1992 slightly decreased from 1991 (0.6/100,000). The number of cases by county is shown in Table 1. The highest rates per 100,000 population occurred in Talbot (3.4), Washington (1.7), St. Mary's (1.3), and Harford (1.1) counties. Almost half of the cases (45.5%) had onset of illness in September through December.

The male to female ratio was 1.2:1.0; the ratio of whites to blacks was 2.3:1.0, one case was Asian, and the race of one case was unknown. The age of the patients ranged from 15 days through 78 years (median 30.5 years). Seven cases (31.8%) were less than 14 years of age.

Herpes viruses (9 cases, including 3 post-varicella and 1 post-herpes zoster), *Toxoplasma gondii* (1), *Cryptococcus neoformans* (1), and an untyped enterovirus caused or were suspected to have caused 12 of the cases; the cause for the rest was not identified. Five patients died for a case fatality rate of 22.7%, a threefold increase from 1991 (7.4%). No arboviral encephalitis was reported in 1992; the last eastern equine encephalitis in Maryland occurred in 1989.

GONOCOCCAL INFECTIONS (16,513)

341.0/100,000 (U.S. 195.3/100,000)

Reported gonococcal infections decreased by 24% from the number in 1991 (21,646). The cases by jurisdiction are shown in Table 1. Baltimore City noted a 14% decrease from 1991, but still reported 63.7% of all cases and had the highest rate per 100,000 population (1482.4) in the State. The rate in the counties (excluding Baltimore City) decreased by 37%. Counties with high rates were Wicomico (553.3), Dorchester (458.0), Prince George's (364.2), and Somerset (340.6). The trend of gonorrhea in Maryland and in the United States during the past decade is shown in Figure 1.

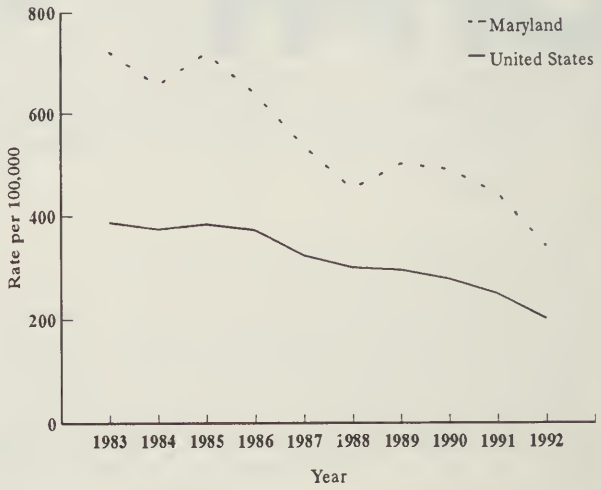

Fig 1. Gonococcal Infection. Incidence Rates in Maryland and the United States, 1983-1992.

The age distribution of the cases was similar to that in 1991 with 82% of cases 15 to 34 years of age. The rates per 100,000 population by age group and sex are shown in Figure 2. In 1992, among the 11,137 cases for whom race was reported, 96% of males and 91% of females with gonorrhea were black.

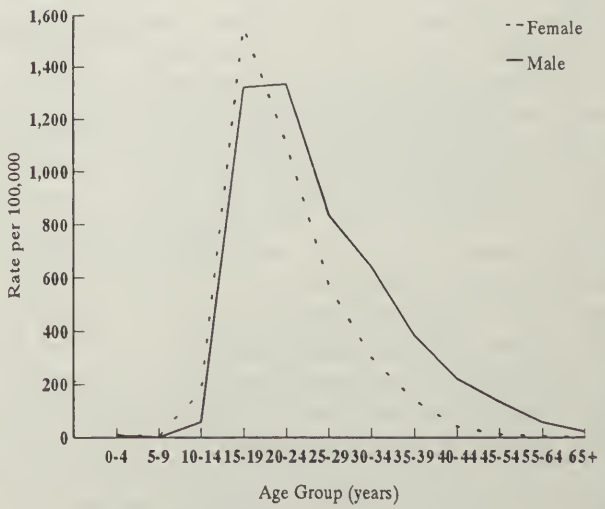

Fig 2. Gonococcal Infection. Incidence Rates by Age Group and Sex, Maryland, 1992.

To be continued August, 1993.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872 or 1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.

PRACTICE FOR SALE

SOUND PROTECTION

Other companies may change their tune every few years, but Princeton's dedication to quality service, aggressive claims handling and a strong financial base remains constant.

One key to insurer stability is capable, consistent management. At Princeton, we have a team of experts with the continuity that leads to sound decision-making every day.

The result: an unwavering commitment to the doctors we protect.

Princeton. It's worth it!

Cover design: Virginia Carter

On the cover: The commissioning and outfitting of the U.S.S. Constellation, which now floats in Baltimore's Inner Harbor, was delayed in 1797 due to a yellow fever epidemic. The yellow flag, commonly known as the "yellow jack," signified—when flown alone—that a ship had no disease on board and was requesting a pratique. Flown with another flag, the yellow jack indicated disease on board the ship. In years past, the yellow jack was often flown on Baltimore buildings to indicate quarantine.

YESTERDAY, TODAY AND TOMORROW

Yesterday Renowned for our consistently high standards, we believe that excellence is never "old fashioned". We developed a laboratory based on high quality, state-of-the-art testing methodologies, personal service, and dedicated patient care.

Today As an industry leader using the most advanced scientific technology, we continue to process your laboratory needs efficiently, quickly and cost effectively. Our skilled staff of pathologists, medical technologists, and hundreds of administrative and support personnel remain dedicated to personal service and personal care.

Tomorrow New technology may bring us an even brighter future, but it will never surpass the human element in our service. Our tradition of caring, and old fashioned pride will never change. Our commitment to excellence will continue to shine brightly in the years ahead.

MARYLAND RESIDENTS:
TWO WAYS TO EARN TRIPLE-TAX-FREE INCOME

100% NO LOAD

T. ROWE PRICE MARYLAND TAX-FREE FUNDS—TWO TAX-SAVING STRATEGIES

As a Maryland resident, you could be losing over 37% of your earnings to income taxes. T. Rowe Price, the leader in Maryland tax-free investing, can help. We offer *two* Maryland funds whose earnings are *exempt from federal, state, and local taxes*—the income is *triple-tax-free*, so you keep everything you earn.* And, because tax-free yields are currently attractive versus comparable taxable yields, your income can be higher with tax-free funds, as the chart shows.

Your earnings can be higher with tax-frees

Annual income on an investment of $20,000 if you're in the 31% federal tax bracket, or 37.2% bracket including state and local taxes

	What you earn		What you pay in federal, state, and local taxes		What you keep
Typical long-term bond fund					
Taxable fund	$1,102	–	$410	=	**$692**
Tax-free fund	$922	–	$0	=	**$922**
Typical short-term bond fund					
Taxable fund	$904	–	$336	=	**$568**
Tax-free fund	$620	–	$0	=	**$620**

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.*

Two no-load Funds let you choose your approach. Whether you want to minimize risk or maximize potential returns, T. Rowe Price has a Fund to suit your needs.

Maryland Short-Term Tax-Free Bond Fund is the *only* Maryland fund to give you the minimal risk of short-term tax-free bonds. With an average portfolio maturity of 1–3 years, it can be appropriate for those who prefer a more cautious investment approach. The Fund offers less risk and lower returns than a longer-term fund.

Maryland Tax-Free Bond Fund—*Maryland's largest tax-free fund*—offers greater income potential, with greater price volatility than our short-term fund. It invests in long-term Maryland securities and has an average portfolio maturity greater than 10 years. Of course, these are both bond funds, so yields and share prices will vary as interest rates change.

Our free report can help you make an informed decision. *The Basics Of Tax-Free Investing* can help you develop a tax-free strategy to meet your investment goals. Each Fund has a $2,500 minimum, offers free checkwriting, and has **no sales charges.**

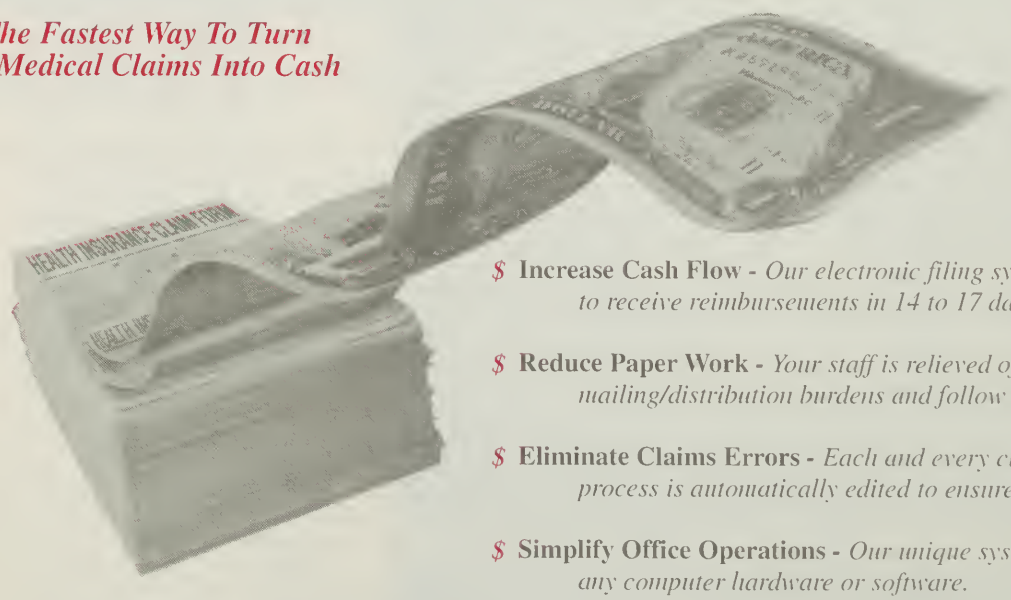
PHYSICIAN PLACEMENT SERVICE



The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872
1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ **announcements for physician placements in the classifed advertisements are charged at the regular classified advertising rate.**

The Fastest Way To Turn Medical Claims Into Cash

$ **Increase Cash Flow** - *Our electronic filing system enables you to receive reimbursements in 14 to 17 days.*

$ **Reduce Paper Work** - *Your staff is relieved of time-consuming mailing/distribution burdens and follow up.*

$ **Eliminate Claims Errors** - *Each and every claim we electronically process is automatically edited to ensure 99% accuracy.*

$ **Simplify Office Operations** - *Our unique system does not require any computer hardware or software.*

Rapid Reimbursement is simply the most effective "all payor" electronic claims processing service available committed to providing physicians nationwide with unparalleled service.

August 1993

Med Chi Sponsors Press Conference on Statewide Substance Abuse Education Program

On August 4, 1993, Med Chi, in conjunction with the Governor's Drug and Alcohol Abuse Commission, held a press conference to announce the initiation of a statewide substance abuse education program. The program has already been presented by Med Chi to over 500 physicians practicing in Baltimore City. It is designed to help physicians identify, treat, and refer patients with substance abuse problems. Statewide courses will begin this fall.

The following media covered the story:

Television

- WJZ-TV (Channel 13)
- WBAL-TV (Channel 11)
- WMAR-TV (Channel 2)

Radio

- WPOC-FM, Baltimore
- WBAL-AM, Baltimore
- WCBM-AM, Owings Mills

Newspaper

- *Arundel Sun*, Anne Arundel County
- *Carroll Sun*, Carroll County
- *Prince George's Journal*, Lanham
- *Baltimore Sun*, Baltimore
- *Evening Sun*, Baltimore
- *Howard Sun*, Howard County

Unique Physician Identification Number

The following services require unique physician identification numbers (UPIN):

- diagnostic laboratory services
- diagnostic radiology services
- consultative services
- specific durable medical equipment
- audiologist services
- physical therapy
- occupational therapy
- surgery

For these services, the name of the ordering/referring physician must be documented in item 17, and the UPIN must be shown in item 17a of the HCFA 1500 form.

Medicare Medical Policies on Critical Care and on Monitored Anesthesia Care

The finalized Medicare medical policy on critical care in Maryland and on monitored anesthesia care (MAC) follow this *Chief Executive Officer's Newsletter*. The latter policy was developed in cooperation with the Maryland Society of Anesthesiologists and is based on standards established by the American Society of Anesthesiologists. Please review these policies and detach them for your records.

Flood Relief

Financial donations are needed to assist Iowans who have been forced out of their homes. The following organizations are accepting donations:

Iowa Cares	American Red Cross	Salvation Army
666 Walnut	2116 Grand Avenue	1330 6th Avenue
Des Moines, IA 50309	Des Moines, IA 50312	Des Moines, IA 50304
	Attn: Brother Phillip	Attn: Lt. Hellstrom

It has been estimated that one-third of Iowa's corn and bean crops are gone, and hundreds of people have lost everything including their homes. There has been damage to bridges, roads, and sewer systems. Business losses in the city of Des Moines alone could exceed $700 million.

Warner-Lambert Reaches Agreement with the Food and Drug Administration

Warner-Lambert (Parke-Davis and Parke-Davis Consumer Health Products Group) has been working with the Food and Drug Administration (FDA) to resolve issues about its manufacturing operations. The company recently reached an agreement with the FDA in the form of a consent decree. This decree ensures compliance with good manufacturing practices (GMP). The agreement calls for certification of all Warner-Lambert drug products. No interruptions in the supply of over-the-counter products is expected; however, spot shortages could occur. There may be interruptions in supply and distribution of certain Parke-Davis prescription products and, in a few cases, discontinuation.

The safety and efficacy of the company's products are not at issue, and the decree does not require any product recalls. Warner-Lambert has realigned its manufacturing and quality assurance operations and committed human and capital resources to achieving compliance with GMPs. If you have questions, please call the Warner-Lambert Information Service at 1-800-926-1151.

Risk Management Program

As of August 1993, the Medical Mutual Liability Insurance Society of Maryland (Med Mutual) has presented more than 62 risk management seminars, "Medicine on Trial." In excess of 3,000 physicians have participated in these programs and will receive a 5% premium discount on their 1994 Med Mutual individual renewal policy premium. To take advantage of this opportunity, attend one of the following seminars designated for 2 credit hours in Category 1 of the Physician's Recognition Award.

August 17	Colony South Hotel, Clinton
August 19	Med Chi, Baltimore
August 24	Kent/Queen Anne's Hospital, Chestertown
August 31	Shady Grove Adventist Hospital, Rockville
September 1	Medical Mutual, Hunt Valley
September 2	Patuxent Medical Group, Columbia
September 7	Cambridge Yacht Club, Cambridge
September 8	Medical Mutual, Hunt Valley
September 9	Anne Arundel Medical Center, Annapolis
***September 11**	**Sheraton Ocean City Resort, Med Chi Semiannual Meeting, Ocean City**
September 14	Harford Memorial Hospital, Havre de Grace
September 15	Doctors Community Hospital, Lanham
September 16	Medical Mutual, Hunt Valley
September 21	Holy Cross Hospital, Silver Spring
September 22	Medical Mutual, Hunt Valley
September 23	Frederick Memorial, Frederick

Cost is $40.00. Space is limited, and reservations are accepted on a first-come, first-served basis. To register, call the Risk Management Services Department at 410-785-0050 or 1-800-492-0193.

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

Medical Policy

SUBJECT: **Critical Care**

EFFECTIVE DATE: **7/9/93**

CPT/HCPCS Code(s): **99291, 99292**

Description of Service: Critical care includes the care and monitoring of critically ill patients in a variety of medical emergencies that require the constant attention of the physician (e.g., cardiac arrest, shock, bleeding, respiratory failure, post-operative complications).

PLACE OF SERVICE AND APPLICABILITY OF CRITICAL CARE CODES

- Critical care is usually but not always given in a critical care area such as the coronary care, intensive care, or respiratory care units or the emergency department. However, payment may be made for critical care services provided in any location.

- **Payment may be made under the critical care codes only if the physician is providing constant attention to a critically ill patient (e.g., cardiac arrest, massive bleeding). Services provided in a CCU or ICU which do not meet this requirement are not to be billed under the critical care codes. Hospital care codes rather, should be used to report these services.**

Clinical Indications: PROCEDURES AND CRITICAL CARE SERVICES:

Critical care is considered to be an evaluation and management service and several procedures are included in this service. The following codes are bundled into Critical Care Codes 99291 and 99292 and may not be paid separately

when they are provided on the same day by the same physician as the Critical Care Codes:

36000	Introduction of needle or intracatheter, vein
36410	Venipuncture, adult, necessitating physician's skill; diagnostic or therapeutic purposes; not routine
36415	Routine venipuncture for specimen collection
36600	Arterial puncture, withdrawal of blood for diagnosis
71010	Radiologic exam, chest; single view, frontal
71020	Radiological exam, chest; two views, frontal and lateral
91055	Gastric intubation
92953	Temporary transcutaneous pacing (external)
93561	Indicator dilution studies; with cardiac output measurement
93562	Indicator dilution studies; subsequent measurement cardiac output
94656	Ventilator assistance and management; first day
94657	Ventilator assistance and management; subsequent days
94760	Non-invasive ear or pulse oximetry for oxygen saturation; single determination
94761	Non-invasive ear or pulse oximetry for oxygen saturation; multiple determinations
94762	Non-invasive ear or pulse oximetry for oxygen saturation; continuous overnight monitoring

All other procedure codes can be paid for separately and will not be bundled into the Critical Care Codes.

ECG interpretations (CPT 93000, 93010, 93040 and 93042) will not be paid separately when performed as part of or in conjunction with Critical Care, as with any other visit or consultation.

CRITICAL CARE SERVICES IN GENERAL AND IN TRAUMA AND BURN CASES:

- Under the global surgery policy, a single fee is paid for all necessary services normally furnished by the surgeon before, during and after the procedure. This generally includes critical care services which are considered related to the surgery and cannot be separately billed.

- Critical care services provided during a global period for seriously injured or burned patients are not considered to be related to a surgical procedure and may be paid separately under the following circumstances:

    1. Pre-operative critical care may be paid in addition to a global fee if:

        a. the patient is critically ill and requires the constant attendance of the physician and

        b. the critical care is unrelated to the specific anatomic injury or general surgical procedure performed. Such patients are potentially unstable or have conditions that could pose a significant threat to life or risk of prolonged impairment. (Examples - a trauma or burn diagnosis must be submitted along with at least one of the following diagnoses which require critical care):

            - Acute myocardial infarction (410-410.9) associated with shock (785.51)
            - Cardio respiratory arrest (427.5)
            - Massive hemorrhage (specify site)
            - Acute respiratory failure (518.81)
            - Shock (several types, 785.5 - 785.59; anesthetic shock 995.4; anaphylactic shock, 995.0; post-operative shock, 998.0; traumatic shock, 958.4).

        In order for these services to be separately paid, two reporting requirements must be met. Codes 99291/99292 and modifier 25 ("significant, separately identifiable evaluation and management services by the same physician on the day of the procedure") must be used. Documentation that the critical care was unrelated to the specific anatomic injury or general surgical procedure performed must also be submitted (e.g., a copy of progress notes, the discharge note, an explanatory letter that constant care and attendance was needed along with one of the above listed critical care diagnoses). An ICD-9-CM code in the range 800.0 through 959.9 (except 930-939) which

clearly indicates that the critical care was unrelated to the surgery is acceptable documentation along with the critical care diagnoses listed above.

NOTE: The modifier 25 is intended for use with evaluation and management codes ONLY. DO NOT SUBMIT the modifier attached to surgical codes.

2. Post-operative Critical Care may be paid in addition to a global fee if:

   a. the patient is critically ill and requires the constant attendance of the physician and

   b. the critical care is unrelated to the specific anatomic injury or general surgical procedure performed. Such patients are potentially unstable or have conditions that could pose a significant threat to life or risk of prolonged impairment.

Billing Instructions:

Critical care code 99291 is used to report the first hour of critical care and the code 99292 is used to report each additional 30 minutes. The following represents guidance when these exact times are met.

Code 99291, Critical Care, first hour should be used to report the services of a physician providing constant attention to a critically ill patient for a total of 30 minutes to one hour on a given day. If the total duration of critical care provided by the physician on any given day is less than 30 minutes, the appropriate E/M code could be used. In the hospital setting, it is expected that the level 3 subsequent hospital care code (99233) would most often be used.

Code 99292, Critical Care, each additional 30 minutes, should be used to report the services of a physician providing constant attention to the critically ill patient for 15 to 30 minutes beyond the first hour of critical care on a given day.

- The following example will illustrate the correct reporting of critical care services to hospital inpatients:

Total Duration of Critical Care	Code(s)
a. less than 30 minutes	99232 or 99233
b. 30 - 40 minutes	99291 x 1
c. 75 - 90 minutes	99291 x 1 and 99292 x 1
d. 1 hr. 31 min.-2 hr. 14 min.	99291 x 1 and 99292 x 2
e. 2 hr. 15 min.-2 hr. 30 min.	99291 x 1 and 99292 x 3

COUNTING FULL TIME INTENSIVIST SERVICES

- Concurrent care services provided by the primary physician and the intensivist may be paid as long as there is a written request for the latter's services by the primary physician and the intensivist bills for a consultation or critical care, but not both, and the hospital record justifies payment to the primary physician by documenting that he or she contributed substantially to the patient's care.

CRITICAL CARE SERVICE LIMITATIONS

- There are no absolute limits on the number of critical care services that can be billed per day or per hospital stay.

- A physician, however, must be prepared to demonstrate that the service billed meets the definition of critical care.

- The carrier may request documentation for cases in which it is implausible that the amount of critical care billed was provided (e.g., more than a total of 12 hours of critical care billed by a physician for one or more patients on the same day).

- Only one physician may bill for a given hour of critical care even if more than one physician is providing care to a critically ill patient.

- Critical care services furnished by anesthesiologists (not CRNA's) are coverable.

- If critical care is required upon presentation to the emergency room only critical care codes (99291 - 99292) may be reported. Emergency department codes will not be paid for on the same day.

- If there is a hospital visit early in the day and at that time the patient does not require critical care, but the patient requires critical care later in the day, both critical care and a hospital visit may be paid.

- Documentation must be submitted when critical care is billed on the same day as other evaluation and management services.

Medical Policy

SUBJECT: **Monitored Anesthesia Care**

EFFECTIVE DATE: **Retroactive to May 1992**

CPT/HCPCS Code(s): Use the appropriate CPT-4 anesthesia code followed by the modifier -QS to indicate monitored anesthesia.

Description of Service: The American Society of Anesthesiologists (ASA) defines MAC as "instances in which an anesthesiologist has been called upon to provide specific anesthesia services to a particular patient undergoing a planned procedure, in connection with which a patient receives local anesthesia or, in some cases, no anesthesia at all. In such a case, the anesthesiologist is providing specific services to the patient and is in control of his or her non-surgical medical care, including the responsibility of monitoring his or her vital signs, and is available to administer anesthetics or provide other medical care as appropriate."

Monitored Anesthesia Services include:

- performance of the preanesthetic exam and evaluation,
- prescription of the anesthesia care required,
- personal participation in or medical direction of the entire plan of care,
- continuous presence of the anesthesiologist. In the case of medical direction, the resident or nurse anesthetist being medically directed are in continuous physical presence.
- proximate presence for diagnosis or treatment of emergencies.

- Services provided during the procedure include non-invasive cardiocirculatory and respiratory monitoring, oxygen administration when necessary, and oral and intravenous use of medications; and

- postoperative anesthesia care.

All institutional regulations pertaining to anesthesia services should be observed and all the usual services performed by the anesthesiologist should be furnished.

Clinical Indications:

For procedures which do not usually require anesthesia services, monitored anesthesia would be covered when the patient's condition medically requires the presence of an anesthesiologist or medically directed anesthetist to perform monitored anesthesia in addition to the physician performing the procedure.

1. This policy does not apply to the use of monitored anesthesia instead of general anesthesia.

2. It does apply to pacemaker insertion.

3. It does apply to cataract surgery.

4. Monitored anesthesia care is only covered when the patient's medical condition requires medical direction of the anesthesia to ensure control of the sedation, medication, airway and to prevent sudden changes in condition from disrupting the procedure and placing the patient at risk. Following is a list of such conditions/diagnoses that may require MAC:

   Active hallucinations
   Cardiomyopthy
   Cerebrovascular disease
   Combative patients
   Debridement of burns
   Dressing changes
   Hepatic failure
   Hypertension, unstable
   Hypotension
   Life threatening arrythmias such as ventricular tachycardia
   Morbid obesity

Organic brain syndrome/dementia with confusion or combative behavior
Painful procedures
Peripheral extremity blocks
Renal failure, acute or ESRD patient on a dialysis program
Seizure disorder
Severe anxiety
Severe respiratory disease, emphysema, bronchitis, cor pulmonale, asthma, pulmonary edema, unstable CHF
Tracheostomy
Unstable angina
Valvular heart disease

5. The MAC service rendered must be reasonable, appropriate and medically necessary. Flexibility will be encouraged in reviewing the clinical indications evaluated by the anesthetist in selecting MAC.

6. The following procedures are some but not exclusive examples of those that could qualify for Monitored Anesthesia Care:

00100	00830	01260
00120-00126	00832	01272
00140-00145	00842	01274

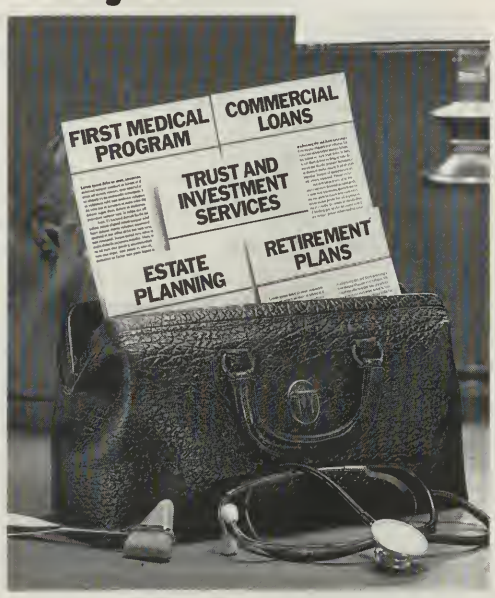
00740	01130	01522
00800	01202	01600
00806	01220	01610
00810	01240	01620
00820	01250	01622

01650	01782	01906
01680	01800	01908
01682	01810	01910
01700	01820	01916
01710	01840	01918
01730	01844	01920
01732	01860	01921
01770	01900	01922
01772	01902	01990
01780	01904	

Billing Instructions:

1. Use the appropriate CPT anethesia code followed by modifier -QS to indicate monitored anesthesia.

2. Reimbursement for MAC will be the same amount allowed for full general anesthesia if all the requirements listed are met. Full reimbursement will be allowed for reasonable and medically necessary services rendered under these requirements which are enumerated under clinical indications. If the latter are not fulfilled, payment will be denied in full.



3. Criteria for medical direction of anesthetists and interns and residents apply to monitored anesthesia services.

4. The Carrier at his discretion may periodically sample anesthesia claims for necessity, appropriateness and adherence to MAC guidelines.

LETTERS TO THE EDITOR

Public health—the other health care system

Affordable health care is a priority issue and uppermost on people's minds these days, especially people who have lost their jobs or are working for companies that do not provide health insurance. Reform of the current system certainly will be debated. By devoting all of our efforts to reforming the current health care system, however, there is a danger that we will lose sight of what I will call the "other" or the "silent" health care system—public health departments. Although little known and often underappreciated, the public health departments in each county and at the state level provide preventive health services designed to promote and protect the public's health. With the state and local funding cuts over the past several years, the public health system—equally as important to the well-being of our communities—is threatened with extinction.

For many years, the public health departments have accomplished their mission quietly and without fanfare. Many of their services, therefore, have been taken for granted. Indeed, many Maryland citizens have little idea of the range of services offered by local health departments. Some consider them agencies that provide medical care only for the less fortunate members of our community—the so-called provider of last resort. Actually, health departments plan, develop, implement, and evaluate preventive health programs for all citizens.

Acute medical care services are not usually provided, but local health departments work to assure access to those services for the people in our communities who need them, regardless of their ability to pay. As those with limited resources are often members of the minority population, both groups receive special attention.

Let me detail just a few of the many programs that health departments provide. Preventing, diagnosing, treating, and controlling the spread of tuberculosis (TB), sexually transmitted diseases (STD), and acquired immunodeficiency syndrome (AIDS) are among the top priorities. These diseases are increasingly common today, especially among teenagers and women, but also in people newly arrived from other countries. Unfortunately, certain lifestyle choices also put people at risk for these infections. Community health education, which is what public health departments do very well, is the most important means of preventing these potentially life-threatening infections.

Prevention programs for women provide family planning, prenatal care, and well-child care, including health education and immunizations. Without these, infant mortality and teenage pregnancy rates would increase dramatically. When you eat in a restaurant or swim in a public swimming pool, your safety is protected by the public health departments' inspection programs. With the help of private doctors, hospitals, and state and national organizations, 20 reportable diseases are traced and treated by local health departments to prevent spread in the community.

Public health services are oriented to prevention rather than treatment. Priorities have been established in this way because the results have been proven to

save lives and scarce dollar resources. In this context, it is important to note that for every dollar spent on prevention, such as immunizations for children, $10 is saved on medical costs that would be associated with treatment of resulting diseases.[1] For every dollar spent on prenatal care, $3 is saved in prolonged hospitalization and care of sick infants.[1] Public health is cost-effective.

In these economic times, setting priorities as to which public health programs can continue is inevitable. At the same time, increasing numbers of county residents now depend on the health departments' clinical services because of lost jobs and worsening family finances.

We must advocate—health care providers and the public alike—as national health system reform becomes a reality, for public health programs. We could understand less funding if the public health needs of Maryland residents had decreased. They have not. I ask the reader, as a health care provider and a Maryland citizen, what would happen if there were not adequate resources to inspect restaurants; to check drinking water supplies; to provide immunizations to children and the elderly; to prevent the spread of communicable diseases such as TB, syphilis, and AIDS; to reduce transmission of rabies and Lyme disease; or to provide health promotion programs to reduce mortality from cancer, heart disease, and other controllable chronic diseases? I submit that the results would be devastating.

Adequate funding for public health must be assured. Without sufficient funding, Maryland citizens could see a rapid reversal in the impressive strides made over the past several decades to make our state and country as safe and healthy as it is. If we are not vigilant, we may be confronted by a resurgence of the disease outbreaks and health problems faced in the early part of this century, as well as the new threats posed by modern society. We must support the public health programs and services that are vital to the health of our citizens.

We diagnose sleep disorders where they occur. At home.

Many patients suffering from sleep disorders can't, won't, or are simply unable to come in for a sleep study. That's a problem for them and for you.

Fully accredited by the American Sleep Disorders Association, Shady Grove's labs are among the area's most sophisticated. And now, to obtain diagnostic data needed to treat patients with sleep disorders, we've established an effective in-home program. For the patient, costs are usually covered by insurance.

Into the home environment, almost anywhere in Maryland, we bring the essential resources of a well-equipped lab. Our technology includes nine-channel recorded and reviewed monitoring, covering EEG, respiration, leg movement, and tracheal sound.

Studies are performed by specially trained sleep technicians who work under the direction of Registered Technicians. You can count on receiving a full report within 72 hours of the study, with interpretation by a board-certified sleep specialist physician. When it comes to diagnosing sleep disorders, rest assured, we do some of our best work...at home.

In-home studies can be diagnostically as accurate as those conducted in a laboratory setting. We'd be pleased to show you why. Just call us at 301-251-5905 and we'll send you the recent ASDA position paper on in-home studies, and we would be pleased to discuss its appropriate clinical use.

Baltimore's public health contributions and today's problems

John B. De Hoff, M.D., M.P.H.

Dr. De Hoff is the former commissioner of health for Baltimore.

ABSTRACT: *The health department's early development and the protective roles of public health roles are described. Qualifications for public health leadership are examined. The diminishing and changing nature of services resulting from continuing federal and state cutbacks are discussed. New public health policy requires major changes in national ideology and politics.*

Only a few decades ago, when physicians or residents of cities and counties spoke of public health, they meant their local health departments. Without question, public health was centered in, and developed from, those local health agencies. Still known for their protective work in health education and sanitation, these "healthy departments" are charged by law with keeping their respective populations safe from preventable diseases and dangerous environments.

In earlier years of organized public health activities, marshes and their noxious effluvia, decaying animals and plants, and fomites were suspected of harboring transmissible disease causes. Contagion was less well understood, and effective vaccines, other than cowpox, had yet to be developed. Deaths from infectious diseases such as diphtheria, scarlet fever, polio, meningitis, tuberculosis (TB), typhoid, or any of the pneumonias were real threats to families. Many patients who recovered from these acute infections often experienced long-term disabilities, loss of employment, or even impoverishment.

Public responses to these potential health dangers included the construction of Sydenham Hospital—now the Montebello Rehabilitation Hospital.[1] This special hospital cared for persons with acute communicable diseases from the time when there were no specific treatments available until the beginning of the antibiotic era. Sydenham's clinical records documenting infectious disease therapy from 1909 to 1949 are preserved in the National Library of Medicine as an example of one municipality's public response to acute infectious illness control.

Health departments' clinical and industrial laboratory services, vaccination, school health programs, maternal and child health care services, public general hospitals and special hospitals for infectious diseases, clinics for the treatment of sexually transmitted disease (STD) and TB, and programs to provide sanitary inspection of housing and food supplies were established to keep citizens healthy. Waste disposal, water purification, and housing inspections remain health department tasks.

> It shall be the duty of the commissioner of health, from time to time, to make a circuit of observation to the several parts of the city and its environs, which, from their location, or from any collateral circumstances, may be deemed the cause of disease, and in all cases where he may discover the existence of any agent, the presence of which will prove dangerous to the health of the inhabitants of the city, he shall cause any ordinance in existence for its correction to be enforced, or if there be no ordinance competent to the correction of the evil, he shall make a full report of all the attending circumstances to the mayor, accompanied with his opinion of the necessity of extraordinary or particular actions. It shall be his duty also to make diligent inquiry and investigation into all cases or reports of cases of communicable diseases which may occur or come to his attention, and cause such immediate measures to be taken as are particular to arrest their progress, and generally to notice all things that relate to the preservation of the health of the inhabitants of the city.

Figure 1. Baltimore City Health Code of 1879, Article 23, Section 5

Quarantine has long been used as an effective public response for controlling the spread of communicable diseases. In the 1920s, for example, children with pertussis were required to wear orange-yellow arm bands labeled "WHOOPING COUGH" as a warning that susceptible adults and other children should avoid contact with them. Sporting the arm bands and under a kind of ambulatory quarantine, symptomatic infected children were kept out of school but were permitted to play in their own neighborhoods with immune children. Health department officials also placed placards on private dwellings in which there were cases of measles or scarlet fever to warn visitors that infection lurked inside. Before any house quarantine was lifted, officials fumigated sickroom areas with an acrid, formaldehyde-like smoke in a further attempt to limit spread of disease.

This tradition was present as recently as the 1980s when a research team experimenting with respiratory viruses wanted to minimize transmission of an infectious agent. In search of a nearly perfectly isolated hospital ward, they asked that it be officially quarantined. The Baltimore City Health Department's chief of communicable disease agreed, and he made and hung at the elevator entrance to the experimental floor a traditional sign of contagion—the yellow flag warning of quarantine (the yellow jack).

Two centuries ago when yellow fever was decimating the population of Philadelphia and then threatened Baltimore Town, elected authorities appointed their first health officials who imposed quarantines by land and by sea. Dr. Worthington and Dr. Ross were asked to protect Baltimore citizens from a deadly disease of unknown nature—a task worthy of an army of defenders. Their work began a community service that continues today as the mayor's official health protection arm.

Relationships and duties of official health agencies were detailed in Baltimore's health code of 1879.[2] More than a hundred years ago, the code described the health commissioner's roles in terms fully applicable to today's health conditions, condensing almost all the general and important responsibilities of a health officer in its opening sentence (**Figure 1**).

In 1879, Baltimore was small enough that, by horse and buggy or on foot, the commissioner and helpers could personally inspect areas and conditions thought to endanger the public's health. This kind of direct observation, called "shoe leather" epidemiology, is extended by other techniques, one of which is the direct reporting of diseases and injuries by physicians, hospitals and other caregivers.

The code of 1879 also adjured the commissioner of health "generally to notice all things that relate to the preservation of the health of the inhabitants of the city." Furthermore, "in all cases where he may discover the existence of any agent, the presence of which will prove dangerous to the health of the inhabitants of the city, he shall cause any ordinance in existence for its correction to be enforced ... if there be no ordinance competent to the correction of the evil, he shall make a full report of all attending circumstances to the mayor, accompanied with his opinion of the necessity of extraordinary or particular action." That reporting requirement helps to keep the chief elected official aware of the health status of people in a jurisdiction. Advice about what should be done to improve unhealthful living conditions is a major role of every health director, as are health law enforcement and codification of sanitary regulations.

The health officer's broad scope of action for health is limited only by a political subdivision's borders. Health department staffs have the duty to intervene whenever a public health risk becomes apparent and have the right to enter buildings, subject only to civil restrictions that apply also to other governmental agencies. Whenever the public health of inhabitants is endangered, health departments are expected to take necessary remedial actions or plan for correction of health threats. Thus,

a health department must be considered as a division of public safety, equivalent to fire and police departments, when prompt actions are needed to protect or preserve human health.

Public health departments are governmental agencies and derive authority from the laws of their jurisdictions. Each reports to a mayor, county commissioner, governor, or the president of the United States, and operates in accord with the policies of one or all of these elected officials. This relationship sets health departments apart from practicing physicians, hospitals, and other health professionals because health officers must enforce health code sections governing activities of each licensed or credentialed profession.

Health department directors require experience in fields other than personal care, including special preparation in addition to medical or professional school training. An article in *JAMA* recognized this a century ago when it noted that "there has probably been no time in the history of this country when trained, competent, and efficient health officers were needed so much as they are now."[3] In general, the director of a major health department should be a physician specially trained in public health disciplines and with board certification preferably in general preventive medicine. Public health practice is a complex field, requiring the combined efforts of 20 or more professional skill groups to accomplish its tasks.[4] Management of large health departments and relationships with elected officials requires administrative and policy skills not frequently used in the private practice of medicine.

Both mutual respect and tensions have always existed between public health officials and private practice physicians, much like traditional "town and gown" rivalries. Private practice and public health practice have different missions and report to different authorities, but workers in both fields have a special social accountability in which success is measured by the health of people. Procedures and work products may vary, but health departments and medical societies have found they can work cooperatively to advance the public's health. For more than 25 years, the Baltimore City Medical Society has worked continuously with the Baltimore City Health Department, currently through its Liaison Committee.

In a report on the future of public health, the Institute of Medicine (IOM) defined the mission of public health as "fulfilling society's interest in assuring conditions in which people can be healthy, and is accomplished through organized community efforts aimed at the prevention of disease and the promotion of health."[5] Public health, the IOM report noted, links many disciplines and rests on the scientific core of epidemiology. Government's role lies in public health assessment, policy development, and assurance of good health for the public. Local health departments are the front line of public health agencies, responsible for direct delivery of public health services. The IOM report concluded that public health is more than what health departments do—important roles clearly exist for the private sector and for public–private partnerships.

Public health is in a dangerous situation today. Budget-cutting and privatization efforts of the last several national administrations have markedly reduced state and local public health efforts in health improvement and disease prevention.[4]

Austerity policies in health services, with reduced government health expenditures and weakened regulations for effective occupational health and safety and environmental health, have undermined these services' effectiveness.[6] In a recent article, Wasserman et al[7] stated that decreases in budgets, staffing, and services due to FY91 and FY92 budget cuts resulted in program reductions varying from 14% in immunizations to 44% in maternal and child health. Politics and decline or rapid turnover in public health leadership at all levels of government have damaged severely the US public health system.[5]

Clearly, public health is different from what it was when Baltimore Town launched its official fight against contagion by ordering two physicians to keep yellow fever from coming down the Philadelphia Pike or into Baltimore Harbor. Just what the next century's health departments will be like is up for grabs. Medicare, Medicaid, and private insurance provide payments for illnesses or injuries that could or should have been prevented. Sick care is a leaky, almost bottomless barrel into which more and more money can be poured with diminishing marginal results.

Effective work to prevent disease and protect health shares importance with reparative sickness care. Whether accomplished through official agencies or by private physicians and voluntary health organizations, it simply must be funded sufficiently to reduce the money that now has to be spent on disease care. The public wants to retain its healthiness and avoid illness, not just regain, even completely, health damaged by illness or injury. Here is where preventive medicine (health education and promotion) can enter with professionally based encouragement to change lifestyles and provide effective protection against environmental hazards. Nontreatment activities such as these should become life-long personal disciplines, but they lack instant appeal, perhaps because patients see no immediate benefit while they continue to keep their good health.

Health departments find it difficult to adapt to the flow of health funding that is aimed at sickness repair but which neglects disease prevention. With more funds labeled for personal care that can be provided elsewhere, health departments are less able to staff underfunded clinics for lower income persons with communicable diseases who live in hard to reach places. In all probability, care of epidemic or endemic diseases and those requiring difficult follow-up will fall to health departments. In private conversations, some health officers have admitted they rely on personal, comprehensive care clinics

to justify their department's very existence at budget times. Instead of treating patients, however, future health departments may depend on public health nursing services, environmental hazard control, health code enforcement, health data collection and analysis, and other supervisory activities that private organizations cannot legitimately or economically carry out. This will require that all levels of government recognize the important of these tasks and provide adequate, stable funding to carry them out.

Major changes in public health services require the consent of elected officials and a knowledgeable public, and should be conducted with advice and guidance from associations and public health schools. To date, little interest has been shown in developing new health department models designed to manage twent-first-century public health problems. The list of challenges is long and includes improved community relations; modern administrative technologies for rapid processing of statistical and epidemiological information; flexible staffing that includes continuing education for new tasks; and advanced health promotion techniques to meet community desires for better health.

Changes in local health department services, if they occur, may be slow, painful, and dependent on other developments in the complicated field of public health. Yet, if health departments are really the public's front line of defense against illness and injury, pressure for their betterment should be coming from professional societies, public health schools, citizen groups, service organizations, and business leaders as well as public health director associations.

"Public health policy in the 1990s will be determined not only by factors intrinsic to the health field but by external circumstances related to international and domestic political and economic changes.... Gains in specific areas of public health will undoubtedly be made in the coming decade, but fundamental changes in public health policy will require far-reaching changes in the nation's ideology and politics."[8]

Baltimore City Health Department: 200 years of progress and partnership

Peter L. Beilenson, M.D., M.P.H., and A. Soula Lambropoulos, M.S.

Dr. Beilenson is the commissioner of health for Baltimore City. Ms. Lambropoulos is the assistant to the deputy commissioner of health, Baltimore, Maryland.

ABSTRACT: *The Baltimore City Health Department began its long history of protecting the health of Baltimore citizens in 1793. An outbreak of yellow fever in Fells Point on the northwest branch of the Patapsco River was the impetus for the governor's appointment of the first two health officers. Since that time, the health department has worked closely with the medical community to promote education and preventive measures (e.g., sewer systems, water chlorination, food inspection) in order to stop the spread of communicable diseases. For 200 years, the Baltimore City Health Department has provided "the advocacy and leadership necessary to ensure the protection and promotion of the health of Baltimore's citizens."*

Baltimore has a long tradition of civic interest, activism, and pride in the health and well-being of its citizens. The need, however, for a public health department was quite obvious before the Baltimore City Health Department's inception in 1793. During the meetings of the Continental Congress of 1776 and 1777, delegates complained regarding the lack of cleanliness. Oliver Wolcott of Connecticut called Baltimore "the most dirty Place I was ever in." [1] Matthew Thornton of New Hampshire wrote that in Baltimore "the man with the Boots has very great Advantage over a man with Shoes, the Carriages are Stoped (sic) by the Depth of the mire in the middle of the Street...." [2]

Public health policy is defined by the calamities that grip the public. Baltimore's public health institutions have always risen to meet the individual plagues of the day. One of the city's early public health concerns was yellow fever, caused by a then unknown entity and with seasonal fluctuations in its virulence. Baltimore's early public health history was, therefore, the early history of yellow fever in this country. In November 1785, several prominent Baltimore citizens petitioned Governor William Paca to establish a health

office to address a variety of scourges and pestilential diseases.[2] Governor Paca left office at the end of that month, and no evidence has been found regarding his response to the petition. Shortly thereafter, outbreaks of yellow fever and smallpox intensified the need for a public health officer.

In 1791, New York was overcome by an outbreak of yellow fever; Philadelphia succumbed the following year. In fact, the Philadelphia outbreak caused 10% of the city's 40,000 inhabitants to perish.[3] In 1793, Baltimore became a port of refuge for the French who fled the Haitian revolution. In the sweltering heat of that summer, yellow fever broke out in Fells Point on the northwest branch of the Patapsco. On September 12, 1793, Governor Thomas Sim Lee issued a proclamation appointing Drs. John Worthington and John Ross as Baltimore's health officers. Their duties were to prevent the spread of yellow fever into Baltimore.[4] Dr. Ross served as the quarantine physician responsible for stopping yellow fever at Baltimore's port;[5] Dr. Worthington was responsible for patrolling the traffic on the northern roads linking Baltimore and Philadelphia.[6] These health officers, also referred to as quarantine physicians, inspected arriving ships at Whetstone Point (to the west of what was later to be known as Fort McHenry, on the northeast branch of the Patapsco River) to determine if they were safe to dock or if they required quarantine. In 1794, Thomas Drysdale, a student of Benjamin Rush, the top physician of the day, was also appointed as a health officer.

During a town meeting in the summer of 1794, a Committee of Health was created and a quarantine hospital at Hawkins' Point (located at the south end of where the Francis Scott Key Bridge now stands) was authorized. The committee, chaired by Alexander McKim, informed Baltimore's citizens that there was no longer any evidence of yellow fever. "And though the town is sickly, yet no other disorders prevail but those common to the season...."[7] It is important to note the astute observations of the colonial physicians who recognized that yellow fever epidemics occurred in the summer and fall and disappeared with the arrival of the first frost.

On January 1, 1797, Baltimore was incorporated as a city. Since that time, public health legislation in Baltimore City has continued as an extension of the two major health ordinances of 1797 (i.e., Ordinance No. 11 and Ordinance No. 15). "The former dealt particularly with the control of pestilential diseases and the latter with the control of nuisances and other matters of general sanitation."[8] The "placing of the powers and duties of the health department under nine commissioners of health was... done with the intention of having all sections of the city fully and forcibly represented."[9]

Ordinances 11 and 15 have undergone many revisions in the 196 years since they were written. Early modifications were most likely initially influenced by the development of smallpox vaccine and by John B. Davidge, M.D., who, in 1797, was the first to publish a statement, in the *Federal Gazette of Baltimore*, that yellow fever was not contagious[10] but was transmitted by the white-legged *Aedes aegypti* mosquito. By the end of 1797, the health department had two clearly defined roles: (1) keeping contagious diseases out and (2) cleaning up rubbish and inspecting meat and fish brought into the city's boundaries.

Despite public assurances that yellow fever was not contagious, the debate was not quelled. The 1797 epidemic delayed the "outfitting and commission of the USS *Constellation*.... The stately new frigate slid down the ways at Fells Point and majestically came to anchor one-hundred yards offshore."[10] Workers were afraid to come out of their homes. The controversy regarding yellow fever ensued for years. Even President Thomas Jefferson's 1804 State of the Union address did not persuade people. Not certain as to whether or not quarantines prevented the spread of yellow fever, the health department continued addressing the threat with quarantine and sanitary measures. Although Baltimore suffered its last serious yellow fever epidemic in 1819, an 1821 ordinance required the Board of Health to fence in and guard all those districts with yellow fever, and a yellow flag (yellow jack) was displayed in the infected area.

Finally, in the health department's 1830 annual report, consulting physician Horatio Jameson, M.D., urged the mayor and city council to bring the city's antiquated quarantine regulations in line with the modern belief that yellow fever was not contagious. Quarantines against yellow fever were eventually dropped in the nineteenth century (although the World Health Organization (WHO) still considers yellow fever a quarantinable disease). The quarantine method proved useful in the 20th century, however, with respect to scarlet fever, diphtheria, smallpox, and, more recently, in a limited way, along the US borders in the case of individuals infected with human immunodeficiency virus (HIV).

The health department's internal structure was reorganized several times in the 1800s. In 1801, the number of health commissioners was reduced from nine to five, with each commissioner allotted one district. In 1803, the number of commissioners was decreased to four, but their authority was increased with power over nuisances on private properties, including docks. In 1808, the position of quarantine physician was abolished, and the number of commissioners reduced to two. In 1815, the department's first annual report was published. By 1817, the department's oversight included springs and wells that were now required to be protected from nearby privies and cesspools to safeguard drinking water from contamination. In 1820, a consulting physician was appointed to advise the mayor regarding the city's health.

The health department's mandates grew as sanitation technology advanced. In 1824, French drains were constructed to clear water from streets, promote better sanitation, and elimi-

A Proclamation: Thursday 12th September 1793

Whereas it appears by the representation of a number of respectable inhabitants of Baltimore town, accompanied by a report from several eminent Physicians of the said town that a malignant and highly contagious fever is at this time raging in the City of Philadelphia, and that through the constant intercourse between that City and Baltimore there is great reason to apprehend that this fatal disease will be introduced into the said town unless immediate measures are taken to prevent so great an evil, And Whereas by the Constitution of this State, the Governor for the time being is authorised to order and compel any Vessel to ride quarantine, if such Vessel or the port from which she may have come, shall on strong grounds be suspected to be infected with the Plague and Whereas in the present case the exercise of this authority according to the letter thereof without taking similar precautions by Land would not effect the purpose evidently contemplated by the said Article of the Constitution, of securing the good people of this State from such dreadful visitation, I have therefore thought proper to issue this my Proclamation Ordering the directing that all Vessels coming immediately from Philadelphia or from any place to which the aforesaid Malignant disorder may have spread, and all Vessels having persons or goods on board coming from Philadelphia or any other infected place be subject on approaching the Harbour of Baltimore town or any other Harbour within this State to the performance of a quarantine not exceeding forty days; or as much less as shall be judged safe by the persons appointed or to be appointed Health Officers for the different towns and Harbours aforesaid, and I have with the advice of the Council thought fit further to direct that all persons coming to Baltimore town, to Havre de Grace, to the Head of Elk or by any other route making their way into this State from Philadelphia or any other place known to be infected with the said disorder shall be subject to be examined and prevented from proceeding, by the persons who will be appointed for the said purpose, and who will be instructed to take the opinion and advice of the Medical faculty in every case, in order that private affairs and pursuits may not be unnecessarily impeded.

And as the town of Baltimore by its extensive trade and populations is the place in which the introduction of the said disorder is most likely to happen, and its effects the most to be apprehended, I have thought proper to proceed without delay to the nomination of persons for that place, and do accordingly appoint Doct'r John Ross Health officer for the approach by water, and Doct'r John Worthington Health Officer for the approach by Land to the said town, with full power to stop and prevent the landing or entrance of all persons who according to appearances and the best information they can procure shall have come immediately from the City of Philadelphia or other infected place and in like manner of goods or articles of any kind, and the Faculty of Baltimore town are hereby authorised and requested to assist the said Health Officers with their Judgement and advice in every doubtful Case: and until particular persons shall be appointed for other places, the Justices of the Peace and officers of every kind are hereby authorised to take steps consistent with the tenor of this proclamation for their own safety, and that of their fellow-Citizens and all public Officers and the good Citizens of this State in general are hereby called upon to be aiding and assisting towards effecting the object of this Proclamation.

Given at the City of Annapolis under the Seal of the State of Maryland this twelfth day of September in the year of our Lord One thousand seven hundred and ninety three

By his Excellency Thomas Sim Lee Esquire Governor of Maryland

nate disease and pestilence caused by accumulated filth. In 1845, the department was again reorganized with one commissioner of health and one city physician, who, with the health officer or quarantine physician, constituted the Board of Health. In 1861, the offices of city physician and commissioner of health were combined and an assistant commissioner of health was provided. During the late 1800s, the commissioner of health was authorized to order all postmortem examinations through the contracting of surgeons; made registrar of vital statistics; was empowered to appoint a chemist and food inspectors; and was authorized, in 1896, to establish chemistry and bacteriology laboratories. These laboratories allowed for milk analysis and the first systematic study of the city's water supply. The laboratories were an invaluable tool in the fight against typhoid. In 1900, the Board of Health was abolished, and the commissioner of health was given sole responsibility for the health department. Since that time, the law has required that the commissioner of health be a physician with a minimum of five years of experience and in active practice at the time of his or her appointment.

In 1896, a turning point occurred in the health department's attitude toward communicable diseases. From that time on, the department made a "more serious effort to apply consistently old knowledge and theories, with modifications and amplifications, under the stimulus of the rapidly accumulating knowledge of modern chemistry, pathology, and microparasitology."[9] The commissioner of health strongly urged physicians to report cases of disease and suggested more funding and appliances, better training of corps of disinfectors, sufficient hospital facilities, and better supervision of the infected. Prior to these more aggressive modalities, "patients were discharged from isolation and quarantine under no fixed rules and on the certificate of the attending physician that in his opinion danger of transmitting the disease had passed.... He [the commissioner of health] suggested a system of school inspection and the inauguration of measures to prevent pulmonary tuberculosis."[9] In 1905, a system of medical inspection of school children by the department's first nurse was created. In 1909, the Sydenham Hospital was opened for patients with scarlet fever and diphtheria. By 1910, a division of tuberculosis that included nurses and dispensaries was begun. The Bureau of Child Welfare was established in 1919, its focus being lowering morbidity and mortality among the very young and their mothers.

Throughout its 200 years, the Baltimore City Health Department has promoted preventive policies that attempt to anticipate and remedy diseases prior to their swelling into an epidemic. The 1793 appointments of Drs. Worthington and Ross began this tradition of prevention and response to contemporary problems when the major public health concern was yellow fever and other contagious diseases. Today's public health concerns are different (e.g., cancer, heart diseases, acquired immunodeficiency syndrome (AIDS) and environmentally related diseases). Yet, the basis underlying the work and accomplishments of the Baltimore City Health Department remains constant: to protect, insure, and continue the sound health of the citizens of Baltimore through preventive measures and education.

Advanced medical technology and improvements in civil engineering resulted in tremendously beneficial public health changes in the twentieth century. When the century began, Baltimore lacked a sewer system, clean water, and pure milk—all of which caused frequent typhoid deaths. However, the partnership between the Baltimore City Health Department and the medical community resulted in the milk ordinances of 1908 and 1917, the 1911 opening of the sewer system, and the chlorination of water beginning in 1911, all of which effectively eradicated typhoid from Baltimore City. The support given by the medical community to the Baltimore City Health Department's efforts in addressing a variety of issues (e.g., prevention of yellow fever, diphtheria, scarlet fever, tuberculosis, polio, AIDS, sexually transmitted diseases, lead paint poisoning, and teen pregnancy, as well as mental health and addiction services, vaccinations, domestic and occupational safety, and minority health issues) has been ever-present.

Today's preeminent viral epidemic is AIDS. As they did in 1793 with the yellow fever epidemic, private physicians, community advocates, and the Baltimore City Health Department are working together to treat the sick and prevent the spread of the disease. Baltimore's private physicians have been an integral part of the city's public health structure and the workings of the Baltimore City Health Department. Throughout the years, physicians—whether as individuals or as members of the state and city medical organizations—have been leaders and supporters of public health standards and services. As stated in the Baltimore City Health Department's mission statement, the emphasis of the department is to function "as the local public health authority, ... to serve as an architect and catalyst for needed change in the health and human services systems of Baltimore City. We will provide the advocacy and leadership necessary to ensure the protection and promotion of the health of Baltimore's citizens."[11] We do so in keeping with the theme of our 200th anniversary celebration: "200 years of partnership and progress."

The Baltimore City Health Department invites you to join in its bicentennial celebration by reading this issue of the *Maryland Medical Journal* in which health department physicians, public health workers and administrators, and colleagues in the private sector have written about their work. The Baltimore City Health Department is proud to have been an integral part of health care in Baltimore for the last 200 years.

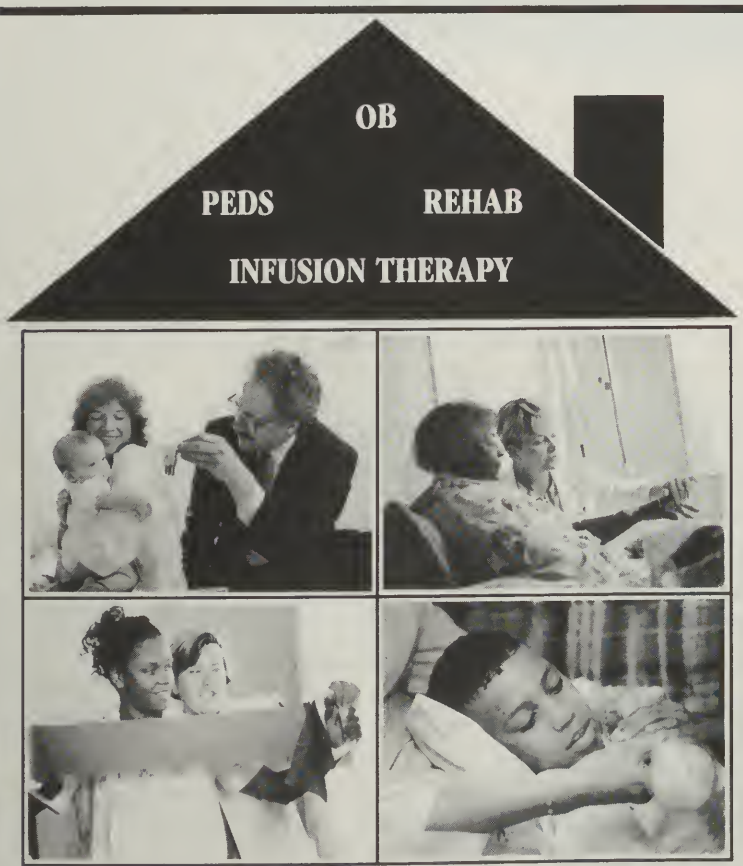
You'll love working with our locum tenens physicians and allied health care professionals.

WE GUARANTEE IT.

CompHealth has thoroughly credentialed physicians and allied health care providers from more than 40 fields of specialization available to provide locum tenens, or temporary, staffing assistance when and where you need it.

Plus, we have the standards and experience to guarantee your satisfaction each time we place a member of our medical staff in your practice or facility. It's the closest thing you'll find to a risk-free way to cover for absent staff members, "try out" a potential new recruit, or take care of your patients while you search for a new full-time associate.



Call us today to arrange for quality locum tenens coverage, or to discuss your permanent recruiting needs.

THE FACTS ABOUT MRI IN BLACK AND WHITE.

Independent tests and physician reports confirm that MR images generated by a 1.5 Tesla MR system are of a higher resolution and superior quality than those produced by an open-air, low-field system.

At the MRI Center at Saint Joseph Hospital, we believe in giving physicians and patients the best diagnostic imaging services available anywhere. Which is why our facility features a General Electric 1.5 Tesla MR system.

Better images result in better diagnoses. And that's what we're here to provide.

Partners in community health: The Baltimore City Health Department, the Johns Hopkins School of Hygiene and Public Health, and the Eastern Health District, 1932-1992

Elizabeth Fee, Ph.D.

Dr. Fee is professor of history and health policy, Department of Health Policy and Management, Johns Hopkins School of Hygiene and Public Health.

ABSTRACT: *The Eastern Health District of Baltimore was established in 1932 as an early partnership between the Baltimore City Health Department and the Johns Hopkins School of Hygiene and Public Health. Although its heydey occurred in the thirties and forties, for 51 years the district has provided data for researchers studying community health problems; learning opportunities for students in medicine, nursing, and public health administration; and a wide array of clinical and public health services to urban residents. The Eastern Health District concept has been copied worldwide, and although the partnership between the health department and the school of public health has changed over the years, some collaborative activities continue the tradition of research and service provision.*

The Eastern Health District of Baltimore, established in 1932, was the most famous result of the early partnership between the Baltimore City Health Department and the Johns Hopkins School of Hygiene and Public Health. Participants in this joint venture had different but complementary interests: Hopkins faculty wanted to do research on community health problems and teach students practical methods of public health administration; Baltimore City Health Department staff wanted to demonstrate how public health services could best be provided in an urban setting.[1] These goals were broadly endorsed within the larger public health community. The joint project was funded by the Rockefeller Foundation and warmly supported by Joseph W. Mountin of the US Public Health Service (PHS).[2]

In 1932, the Eastern Health District was composed of 60,000 people in 15,000 families living in approximately one square mile of East Baltimore immediately surrounding the school of public health—bounded on the west by Caroline Street, on the north by Chase and Eager streets, on the east by

Figure 1. A public health nurse ready for home visits in the Eastern Health District. (Baltimore City Health Department.)

East Avenue and Loney's Lane, and on the south by Baltimore Street. It was a settled working class neighborhood with a high proportion of homeowners. Although the majority were German and Scandinavian, there were recent Irish and Italian immigrants and African-American families who had moved to the city from the Maryland countryside, North Carolina, and Virginia. The area consisted of neatly kept row houses adorned with Baltimore's famous white marble steps and hand-painted screen doors; many churches, doctors' offices, and corner stores; and just enough saloons, bars, and houses of prostitution to alarm some of the area's more righteous citizens.

Organization of the Eastern Health District

The Eastern Health District was jointly administered by the Johns Hopkins School of Hygiene and Public Health and the Baltimore City Health Department. This dual administrative structure was not an easy one.[3] The district health officer, a city health department member and faculty member in the school of public health, was supposed to balance the needs of research, education, and community service when these were in conflict. In the district's first decade, research was stressed as much as, or perhaps more than, education and service. From 1940 to 1960, however, teaching and community service gradually came to dominate the district's activities. In part, this shift reflected the priorities of Huntington Williams, the commissioner of health, who thought researchers' interests should be subordinated to efficient administration and service delivery.

Many who worked in the district went on to distinguished careers elsewhere. The first Eastern Health District officer, Harry Stoll Mustard, later became commissioner of health in New York City.[4] A master tactician, his political skills proved essential to his success as a public health administrator. Martin Frobisher, head of the district's diagnostic laboratory, later became chief bacteriologist at the Centers for Disease Control (CDC). Others were equally dedicated and talented, including the later Eastern Health District officers—C. Howe Eller, Harry Chant, and George Silver.

The public health nurses were, however, the backbone of the Eastern Health District (**Figure 1**). Katherine Peirce and Mary Johnson, the first nurse supervisors, were assisted by a field staff of fourteen. They provided health education, interpreted physicians' findings to patients, gave instructions on isolation techniques to families of tuberculosis (TB) patients, prepared admission forms to sanitoria, followed up on venereal disease (VD) cases, assessed home conditions before the discharge of premature infants from the hospital, and, in emergency cases, gave bedside care. These nurses understood the health context of the family and community; they knew the social and economic pressures on working class patients and were often able to mediate between the world of the community and the more rarified perspective of the hospital or doctor's office. In addition, sanitarians and inspectors from the city health department moved in and out of the district to investigate milk or meat

quality complaints, to inspect for rodents or other nuisances, to test the air for environmental pollutants, and to examine workplaces for industrial hazards.

The work of the district began in a building on Orleans Street but soon moved to a Monument Street row house to be closer to the school of public health; it remained there until 1955 when a new building was built on Caroline Street. In 1938, the district was expanded, almost doubling its population size. At the same time, the rest of the city's health department programs were reorganized on a district basis, following the model of decentralized local administration.

Many district services concentrated on child health problems (**Figure 2**) such as measles, hearing impairment, and dental health. The district provided prenatal clinics and well-baby clinics (**Figure 3**); free smallpox vaccinations; diphtheria anti-toxin; medical, dental, and eye examinations; child care instruction; doctor and hospital referrals; and a constant stream of health advice distributed to anyone who would read or listen. Public health clinics provided about 50,000 medical examinations each year—approximately one per inhabitant. All newborn children were closely followed.[5] As the *Baltimore Sun* reported, "every child in the district, and a good share of adults, comes sooner or later into the grasp of a health officer or nurse. No child can escape. Some of them are under the benevolent dictation before they are born."[6]

The most important achievement of the first year was a health survey that provided information on the health, sickness, and social conditions of each member of every family in the district. The public health nurses and students worked for seven weeks gathering information door-to-door; the resulting family files would provide a basis for many future statistical studies.[7] The *Baltimore Evening Sun* explained:

> Inquisitive visitors who ask very personal questions are no novelty to the people who live in Wards 5, 6, 7, 10, and the three borderline census tracts of Ward 8. They are, by all odds, the most interrogated, surveyed, examined, investigated and card-indexed citizens of Baltimore—and probably of the 48 states, Alaska, Hawaii, Puerto Rico, and the Philippines.[8]

This district census survey was repeated in 1933, 1936, and 1939, providing a wealth of information on the health status of all district inhabitants and supplying data for many student theses.[9] TB, for example, received much attention as students and public health nurses charted a continuing decline in TB mortality and morbidity, despite a continuing high rate of infection.[10] In 1937, Wade Hampton Frost, professor of epidemiology, was able to argue, in words that have a tragic relevance today:

> We have already reached the stage at which the biological balance is against the survival of the tubercle bacillus.... This means that under present conditions of human resistance and environment the tubercle bacillus is losing ground, and that eventual eradication of tuberculosis requires only that the present balance against it be maintained.[11]

The Eastern Health District also focused on diphtheria, then one of the most prevalent diseases affecting young children. Under Martin Frobisher's direction, workers tested different immunization procedures and documented progress in controlling the disease.[12–15] Soon, diphtheria would vanish as a serious childhood threat.

Chronic diseases

In 1938, the Eastern Health District, in cooperation with the PHS and the Milbank Memorial Fund, started an intensive study of chronic illness in the local population. At the time, little was known about the incidence of chronic disease or common infections, and the survey established a database for public health studies and programs.[16] Researchers conducted monthly house-to-house surveys of about 1,500 families, asking about all illnesses and medical care received. They found the main illness causes were minor respiratory diseases (almost half of the total),

accidental injuries, "degenerative diseases" (including rheumatism, arthritis, and diseases of the heart and arteries), and digestive disorders.[17] The illness rate was approximately one per person per year; chronic diseases were by far the most important source of illness, time lost from work, and mortality.[18] Some 25% of all district families suffered from chronic diseases, and a small proportion appeared to suffer much higher rates of illness, possibly because of poor nutrition.[19]

Mental hygiene

Much district research involved community-based mental hygiene studies. Dr. Adolf Meyer, director of the Phipps Clinic, was trying to develop a "socially-oriented psychiatry" in which psychiatrists and nurses would work with physicians, teachers, charity organizations, and clergy to promote mental health within communities.[20] At the same time, Wade Hampton Frost wanted to measure the prevalence of mental illness in a defined community since nobody knew how mental health problems were distributed in a normal population. The Rockefeller Foundation funded this research on the grounds that "while geneticists have minutely observed the fruit fly through hundreds of generations, and nutritionists and cancer researchers have life histories of the white rat and the mouse, the human individual—the presumed beneficiary of all this study—remains in large measure unknown."[21]

District staff collected records of people who had been seen at mental hygiene clinics, had been reported to the police, or had exhibited "behavior indicating the probability of some mental defect or disorder."[22] About 6% seemed to fall into this general category. These individuals were classified into reaction types: psychotics, psychoneurotics, psychopathic personalities, post-psychotics, mental deficients, epileptics, and the maladjusted. While these early studies seem almost comical from a modern perspective, they constituted pioneering efforts to measure the prevalence of mental disorders in a community.[23–26]

The mental hygiene program staff went beyond measurement and tried to prevent problems by educating mothers in proper child care methods. According to one of the psychiatrists, Ruth Fairbank, many mental ills and resulting social problems began with a lack of parental discipline: "Common sense must grant that the period of growth is the ideal time to develop and foster such habits as emotional control, self-reliance, self-dependence, and the ability to get on with one's fellows."[27] In 1935, therefore, the Mental Hygiene Study opened a Mothers Advisory Service (**Figure 4**).[28] Psychiatrists, psychiatric social workers, and nurses offered advice on routine child behavior problems, such as bed-wetting and temper tantrums; the mothers were grateful and many returned regularly to report their progress. This popular service was gradually expanded by offering a psychiatric consultation service to all district physicians and by adding group therapy sessions where mothers could discuss child-rearing problems. Paul Lemkau, a psychiatrist who became director of the program, later commented: "This was conceived to be a preventive activity. Nobody has ever shown that it was, but it was conceived to be. Certainly, it was obvious that it made people feel better...."[29]

Lemkau did much to develop the mental hygiene field, as it was then called. He developed a popular course using family case study conferences in the Eastern Health District and a textbook used by several generations of public health students, *Mental Hygiene in Public Health*.[30] He extended mental hygiene research and published papers on the prevalence of mental health problems in the community—many written with Christopher Tietze, a talented statistician, and Marcia Cooper, a devoted student who became a psychologist for the Mothers Advisory Service.[31–36]

Syphilis

One important infectious disease project in the district was a study of syphilis started in 1936 by Thomas B. Turner, later dean of the Johns Hopkins School of Medicine.[37] A skilled laboratory scientist with field experience in international health, Turner gathered data on the incidence and prevalence of syphilis in the local community as a baseline against which the relative success of syphilis control efforts could be measured.

The district staff undertook extensive community surveys, collected available records, and encouraged hospitals and private practitioners to conduct Wassermann tests.[38–39] The staff attempted to find, examine, and treat the sexual contacts of all those infected. The published results gave an epidemiological picture of syphilis in an urban community.[40–42] The syphilis program also trained VD control specialists for the entire country. During World War II, Turner became head of the US Army's VD control program. Syphilis research continued through the war years, and, in 1945, the Eastern Health District helped evaluate the treatment of syphilis by the "miracle drug," penicillin.

Community-based research and teaching

The district was a site of community-based health studies during and after the war years. During the war, the rodent ecology project studied rat behavior, tested poisons, and explored methods of controlling the rat infestation of inner city neighborhoods—eventually concluding that rehabilitation of old and dilapidated housing was the only effective method of keeping rat populations under control. The child and maternal health services focused attention on prenatal care and well-baby clinics, and their work helped keep infant mortality rates in the district well below those of the city as a whole.

The Eastern Health District was an undeniable success. Throughout the 1930s and 1940s, officials and students came

Figure 4. The Mothers Advisory Service, part of the mental hygiene program of the Eastern Health District. Attention to early childhood development was intended to prevent mental health problems. Here, a psychiatrist interviews a mother while her children are playing, 1941. (Rockefeller Archive Center, Tarrytown, New York.)

from all over the world to observe the research and training programs—staying for a few hours or for weeks at a time. They copied and emulated the Eastern Health District in cities as diverse as Mexico City and Peking. In 1938, the International Health Division of the Rockefeller Foundation described the district as "an outstanding success in providing practical field training for students in public health; in providing a population group, exceeding 100,000, unequalled anywhere in the country for study purposes because of the complete family records now available; and in elevating public health standards and practices in the City of Baltimore, as well as serving as a model and stimulus for comparable developments in other schools of public health." [43]

In the 1940s, district staff consisted of one full-time and one part-time health officer, and approximately 29 part-time physicians, mostly general practitioners, who worked in maternity, child health, VD, and TB clinics, and served as school physicians in the district's elementary schools. A part-time dentist and full-time dental hygienist working in the dental clinic made routine dental services available to all school children.

Like the health officer, the nursing supervisor taught public health administration at the school of public health. Twenty-five staff nurses provided nursing services in public health clinics, assisted by aides who received on-the-job training. Specialized public health services were directed by heads of the corresponding city health bureaus, such as the Bureau of Communicable Diseases, the Bureau of Tuberculosis, and the Bureau of Child Hygiene. Bureau responsibilities included milk and meat inspection, rodent control, industrial hygiene, housing, communicable disease control, child hygiene, school hygiene, dental care, health information, mental hygiene, and nutrition.

The district provided public health nursing training to all newly employed health department nurses and to senior student nurses from the Johns Hopkins and Sinai Hospital schools of nursing. The curriculum included TB control, VD, mental health, and nutrition, and emphasized the recognition of health and interrelated social problems and cooperation with social agencies in promoting a safe and sanitary environment.

Candidates for the masters of public health degree at Johns Hopkins spent six mornings observing district activities as part of a required public health administration course. Senior medical students spent two mornings a week in district clinics. Students were introduced to public health work by the case study approach—problem-solving by addressing specific health or administrative issues. Medical students received patient assignments and visited homes accompanied by a public health nurse, sometimes also seeing the patient at school, at work, or in a clinic.

Local secondary school pupils also visited clinics as part of their "civic experience" program, to observe public health in action. On request, the district health officer lectured in local schools on subjects such as venereal disease, tuberculosis, and family life.

Clinic services

In the post-war years, child health clinics were organized at five localities—on the principle that every mother should have a clinic within walking distance. The clinics provided physical examinations, counseling, and preventive inoculations; children needing specialist care were referred to area hospitals. The clinics provided free smallpox vaccinations and inoculation of triple antigen for diphtheria, whooping cough, and tetanus; they distributed health education pamphlets on infant care, child health, and lead poisoning.[44]

Beginning in 1948, the health department also financed medical care for indigent patients on welfare. Under the Baltimore Medical Care Program, it gave private physicians a capitation fee of $7 per annum for each eligible patient registered.[45] This entitled patients to receive home and office care from the physician of their choice, provided the doctor agreed to the arrangement.

In the 1940s, TB clinics gave several thousand x-rays each year in the search for active TB cases. High school students received free x-rays as part of their civic awareness orientation to public health. Those at high risk of TB infection, such as health workers, were given BCG (bacille Calmette-Guérin) vaccine. As soon as streptomycin became available for TB treatment, the district pioneered its use in home treatment.

Clinic services performed a two-fold purpose: care for the community and data collection for researchers. The weekly clinic offering free serological screening tests for syphilis provided data for ongoing syphilis research. The child health clinics provided data for family and child health studies, while the TB clinics provided fodder for epidemiological investigations. Research and clinical services thus supported and informed each other.

The principles of informed consent did not always govern district research, but there is little in the records to suggest that community members rejected the services offered or resented researchers' constant probing. There was, to be sure, some minor controversy over the health officer's school lectures on sex education.[46] Some parents were also indignant that their children were being tested and questioned about VD; but on the whole, even these issues seem to have generated little protest. One is left with the impression that most people were pleased with the array of services available and were patient with researchers whose questionnaires sometimes required respondents to reveal the most intimate details of their family and personal lives. We can also conclude that much of the research had clear and direct benefits for those involved: streptomycin really was effective against TB, and penicillin was indeed miraculous in treating syphilis and other infections.

A new infant formula

Also tested in the district was a canned baby food consisting of evaporated milk fortified with all essential vitamins and minerals that was formulated according to a recipe developed by Elmer V. McCollum of the school of public health and Wilson L. Grubb of the Johns Hopkins Hospital. At the time, many mothers were bringing babies suffering from rickets, scurvy, and other nutritional deficiencies to the clinics. Most had been fed for some time on artificial baby foods, canned milk, and infant formulas. McCollum, discoverer of vitamins A and D, developed a formula that was tested by the Baltimore City Health Department and the Baby's Milk Fund Association, tried out in the Harriet Lane Home for Orphans, and fed to approximately 100 Baltimore infants. Edwards A. Park of the Johns Hopkins Department of Pediatrics examined the children, found they had done "unusually well," and declared the food nutritionally healthy. The new canned milk was produced by the National Dairy Products Research Laboratory under the name "Formulac." Formulac was not patented in the hope that all major milk-processing companies would produce it and make it available to large numbers of children.[47]

Squabbles within the family

The last complete health and population census of the Eastern Health District was taken in 1947. In 1949, the

Rockefeller Foundation, responding to reports of an increasingly stormy relationship between health department staff and Hopkins faculty, terminated its direct financial support for the project. By this time, Huntington Williams had made clear his feeling that the school of public health had too much influence in the district. Williams later described his disagreements with the school as "squabbles within the family" that were resolved with the expenditure of much "blood, sweat, and tears." [48]

The most serious struggle came over the location of a new building for the Eastern Health District. Williams insisted that the building be erected at least four blocks away from the school of public health—the minimum distance he thought necessary to guarantee its autonomy.[49–50] Dean Ernest Stebbins said the Johns Hopkins University was willing to provide land and share building costs, but only if the city agreed to the building being located in the same block as the school of public health as "a really outstanding example of city and university cooperation for the benefit of the citizens of Baltimore." [51]

Williams, however, stuck to his position, and the new building was erected at 620 North Caroline Street (**Figures 5 and 6**)—exactly four blocks from the Johns Hopkins School of Hygiene and Public Health. The building carries symbols of both cooperation and competition—the seal of the university and the seal of the city are sculpted together on the facade (**Figure 7**). Buried within the corner stone in a copper box are historical reports, correspondence, and photographs relating to the district's early history. Inscribed above are names of the great public health leaders, including—perhaps in a gesture of conciliation—two from the school of public health: Wade Hampton Frost and William Henry Welch. The building itself is named for Huntington Williams.

With the new building as a symbol of the distance between the district and the school, the close working relationship earlier nurtured between the school and the health department began to fade. Students made field visits to the Eastern Health District but no longer regularly worked there. Faculty members conducted research only if they had the commissioner of health's specific approval. Lemkau, for example, continued the mental

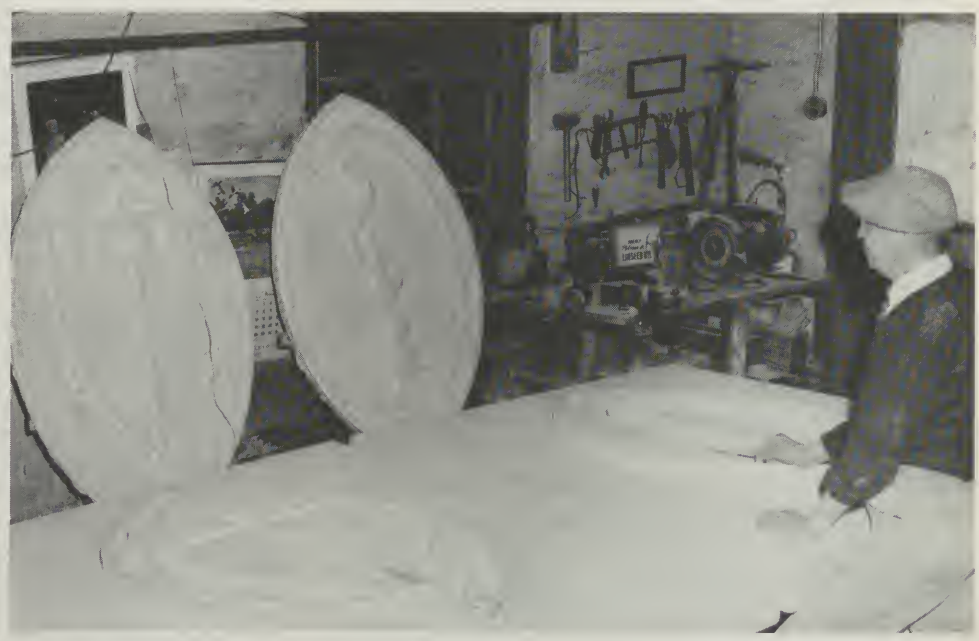

Figure 7. Making the seals for the new Eastern Health District building, January 1954. The two seals represent the Johns Hopkins School of Hygiene and Public Health and the Baltimore City Health Department. (Baltimore City Health Department.)

hygiene program and expanded it to other city areas, but most researchers retreated to their offices to work on statistical data drawn from national population groups; no longer did they collect information by ringing East Baltimore doorbells. East Baltimore's population was left undisturbed by researchers' questions—although residents also lost whatever benefits were to be gained from having their health so closely monitored.

Steps toward a new partnership?

The Eastern Health District was now no longer perceived as a population laboratory for public health research and teaching; it was simply a unit of public health administration within Baltimore. As such, it continued to expand: between 1954 and 1960, its area was enlarged from 2.1 to 24.2 square miles. By 1960, 2 full-time and 72 part-time physicians maintained an array of services, including clinics specializing in prenatal and well-baby care, TB, sexually transmitted disease (STD), chronic disease, and mental health. The district now employed 45 full-time nurses, 15 part-time nurses, and additional student nurses and volunteers to run clinics and make home visits. Specialized vision and audiometric clinics were made available to school children. Fourteen part-time dentists and five dental assistants provided services at the dental clinic and in local elementary schools.

Demographically, the area experienced major changes. Population shifts started during World War II and continued in the fifties, sixties, and seventies. Reflecting a national trend, younger and more prosperous families migrated into suburban areas; young African-American families moved into the neighborhood.[52] Older and poorer whites stayed behind, leaving an elderly white and a youthful African-American population; gradually, the area was reestablished as an essentially African-American neighborhood. In general, district residents were those who had been left behind in the suburban exodus because they could not afford to purchase housing elsewhere. Their health needs were similar to those of poor inner city populations across the country. These needs were at least partially addressed by federal and local programs in the 1960s and early 1970s but were to be generally neglected in the years of Republican administrations.

City health departments everywhere suffered from federal cutbacks in public health funding. In 1975, Dr. John DeHoff, then Baltimore's commissioner of health, saw the budget crisis coming and suggested to John Hume, then dean of the Johns Hopkins School of Hygiene and Public Health, that the school take over the entire Eastern Health District, including the building on Caroline Street, and use it as a student training site.[53] Hume was enthusiastic about the idea but—perhaps because the school of public health was suffering from its own budgetary problems—the suggestion was never taken up and a promising opportunity to marry the academic world of public health research and education with the practical world of public health service to the community was lost.

In recent years, relationships between the Johns Hopkins Medical Institutions and the Eastern Health District have been reestablished. The Eastern Health District's STD Clinic, part of the city's STD/HIV (human immunodeficiency syndrome) Prevention Training Center, is funded by the CDC and is again a national resource for training specialists in STD control. Many center faculty are from Hopkins; Hopkins faculty and clinical staff also provide medical services and conduct research in the clinics through an arrangement interlocking health department treatment and prevention grants with Hopkins research grants. For the past several years, the Eastern Health District has provided space and facilities for the Hopkins-run Alive study, which follows a cohort of 3,000 injection drug users, monitoring them for HIV and TB infection.[54–55] Within the last year, a new collaborative agreement between Hopkins and the district has supplied medical care and made available opportunities for teaching and for research on the growing TB problem and the new drug-resistant TB strains.[56] The district accepts preventive medicine residents and provides a context through which students can gain practical experience in a public health setting.

These new collaborative activities are not yet a match for the explosion of research and services produced in the Eastern Health District in the 1930s and 1940s, but they provide a basis for building a stronger and more extensive cooperative relationship between the Johns Hopkins School of Hygiene and Public Health and the Baltimore City Health Department. Perhaps the 200th anniversary of the Baltimore City Health Department, by offering a chance to reflect on this historical experience, can provide some ideas and inspiration as to new ways of working together to benefit the public's health.

CURTIS Hand Center

The Raymond M. Curtis Hand Center
is pleased to announce the opening of
The Congenital Hand Deformities Clinic

This clinic is staffed by Hand Specialists of The Union Memorial Hospital.

W. Hugh Baugher, M.D.
Thomas M. Brushart, M.D.
Gaylord Lee Clark, M.D.
Peter C. Innis, M.D.
George Lazar, M.D.
Michael A. McClinton, M.D.
J. Russell Moore, M.D.
Anne B. Redfern, M.D.
Keith A. Segalman, M.D.
E. F. Shaw Wilgis, M.D.
Bruce S. Wolock, M.D.
Neal B. Zimmerman, M.D.

Patients are seen on the third Friday of each month beginning at 4:00 p.m.

You are welcome to attend with your patient if you so desire.

For Appointments Please Call:
The UMH Hand Associates Office

Baltimore fluoridates

H. Berton McCauley, D.D.S.

ABSTRACT: *In all the history of human progress, there is no measure for the advancement or protection of the public health more effective at lesser cost than fluoridation of domestic water supplies for the control of tooth decay, the adjustment of the concentration of a substance naturally present in water to a level found to be optimal for dental health. This is the story of its adoption in a city of nearly one million people.*

Dr. McCauley is the retired director (1949-1975) of the Baltimore City Health Department Bureau of Dental Care.

The newsprint was hardly dry when the mayor of Baltimore requested the Baltimore City Health Department and the Bureau of Water Supply to provide information on the feasibility of adding fluoride to the city's water. The mayor was Thomas D'Alesandro, Jr. His request was received first thing in the week of November 3, 1950. What prompted it was news of a resolution passed by the House of Delegates of the American Dental Association, which had convened in Atlantic City on Saturday, November 2. The resolution recommended the fluoridation of community water supplies "when approved by the local dental society and utilized in accordance with the standards established by the responsible health authority."[1]

On November 14, armed with a positive report from the health department, Mayor D'Alesandro announced that "adoption of a plan to retard tooth decay among users of city water by adding fluorine compounds to the supply is under consideration."[2] Budget Director Herbert Fallin was asked whether the sum needed could be made available without unbalancing the proposed 1951 budget. It could. At the same time, a Baltimore City Council resolution requested study of the desirability of using fluoride chemicals in the water supply. Two days later, the press reported the mayor had "ordered the addition of fluorine to the city water supply in an attempt to reduce tooth decay among children." Children between birth and eight years of age, when the teeth are formed, would be most benefited; the cost, $55,480 per year; a beginning date, "no later than January."

It was not to be. *The Sun* lost no time editorially suggesting that our mayor, in ordering fluoridation, had "gone off half-cocked." Tests in other parts of the country still had years to run. Had Dr. Huntington Williams, the health commissioner, talked with Mr. Leon Small, the water engineer? What of the position of the local medical and dental societies? Had anyone consulted Dr. Abel Wolman, the renowned sanitary engineering authority of the Johns Hopkins University, or leaders of the dental faculty at the University of Maryland?[3]

The Honorable Thomas D'Alesandro was not intimidated. In a letter to the *Sun's* editor, the mayor promptly retorted it was the editor who had "gone off half-cocked," reminding him of an Associated Press dispatch dated October 27 that stated, "The [US] Public Health Service said today it has definitely been shown that sodium fluoride, added to the public water supply, will 'substantially reduce' dental decay in children." The mayor pointed out that 36 municipalities were fluoridating their supplies as a routine practice. Also, the city's water engineer, Leon Small, an employee of the Department of Public Works headed by Mr. Paul L. Hollan, had been kept fully apprised of fluoridation plans. The US Public Health Service and the American Dental Association provided sufficient evidence of professional approval. Further, the editor had deliberately ignored a November 6 letter to the mayor from the director of the Bureau of Dental Care:

> As indicated in the attached report of the commissioner of health entitled "Dental Aspects of the Addition of Fluoride to the Public Water Supply," there is good reason to anticipate a reduction of at least 50% in tooth decay at any age among persons who continuously receive water containing one part in a million of fluorine as fluoride while the teeth are being formed; that is, between birth and the eighth year of age. Such a reduction in dental disease among the people of Baltimore would be reflected in greatly improved teeth, health, and appearance for tomorrow's citizens, and a very substantial decrease in the presently staggering total of our population's unmet dental needs....We hope this is the information you want and that you will consider it to the advantage of the people of Baltimore to apply this most promising measure against tooth disease....

And a quotation from Enslow:

> If the process proves worthy of adoption sometime hence, a community denied fluoridation during any period of "watchful waiting" will have lost the value of the treatment for such period. Neither is it pleasant to contemplate that such loss in tooth protection amongst the youngsters cannot be made up through subsequent water treatment.

Informing the citizenry

During the last two months of 1950 and well into 1951, the news media carried many items, editorials, letters to the editor, and testimonials on fluoridation, most of which were decidedly positive, some cautious, a very few frankly opposed. Favorable resolutions and policy statements appeared from the American Public Health Association, November 1; the Baltimore City Dental Society, November 20; the Faculty Council of the Baltimore College of Dental Surgery at the University of Maryland, November 21; the Medical and Chirurgical Faculty of the State of Maryland (Med Chi), November 22; the Maryland State Board of Health at its November meeting; and the Council on Dental Health of the Maryland State Dental Association, December 11. The dean of the dental school at the University of Maryland, Dr. J. Ben Robinson, and Dr. Myron S. Aisenberg, a professor of pathology, not only urged adoption but provided scientific information that did much to allay the fears of people who supposed all sorts of ill effects from putting "rat poison" and "insecticide" in the drinking water.

> With the one part in a million ration planned here, it would take 1,000 gallons of water—at one time—to be lethal....The amount of fluorine that remains in the system is not cumulative to the extent of four grams (the lethal dose).... Animals and fish, dogs, cats, and goldfish, even rats and mice, suffer no ill effects.... Studies of the use of the chemical in test cities over a period of years [yield] no evidence of harmful effects on the bone structure, eyesight, or other bodily development.... A test in New York state has shown a [significant] reduction in decay in a [fluoridated] city....The results should be even better as more time passes.

There was a wealth of supporting information to draw upon, practically nothing but imaginary supposition against it. Controlled programs of experimental fluoridation at the one part per million level in Grand Rapids, Michigan; Newburgh, New York; Brantford, Ontario; Marshall, Texas; Sheboygan, Wisconsin; and Evanston, Illinois, had provided consistent and convincing evidence of effectiveness without harm to the population. Also, there were several hundred thousand persons who had been living for generations where the water naturally contained fluoride in appreciably higher concentrations, in whom toxic manifestations had never been encountered. The Bureau of Dental Care's director lost no opportunity to expand and clarify the anticipated benefits of adoption, responding to numerous and persistent inquiries, largely referred by the mayor or the health commissioner, from individuals, groups, and public media interested in various aspects of fluoridation procedure, effects, or safety. According to the *Sun*, "no one appeared to oppose the use of the chemical in the water supply" at a public hearing of the Baltimore City Council conducted November 27 "because of reports of opposition."

Health Commissioner Williams was beset with recommendations to go along with the mayor and proceed with the plan, beginning with urgings from the health department's Dental Advisory Committee, composed of Dr. George M. Anderson, professor of orthodontics, University of Maryland, and member of the Maryland State Board of Health; Dr. M. Edward Coberth, professor of pediatric dentistry; and Dr. Edward D. Stone, Jr., dentist for the Maryland Casualty Company. The committee met with the health commissioner and dental care director November 20, 1950, leaving no doubt of the desirability of fluoridating the water supply. The effect was heightened by an impressive and rapidly accumulating body of positive data and

widespread interest in such a strikingly preventive measure, which, as early as May 1949, had moved the American Water Works Association to establish policy and procedure guidelines for adding fluoride to public water supplies.[4] To determine possible objection from the commercial community, the health commissioner turned to the Baltimore Association of Commerce. The result was a survey of 16 major companies with diversified products in the chemical, porcelain enamel and frit, drug, soap, electrical insulation, food, beverage, and plating industries, including large users of water for steam generation. No barrier was elicited.

Waiting to see

Nevertheless, the first six months of 1951 passed without definitive progress. The health department's report to the mayor had mentioned that "the data, however promising, are not complete and at least another year of study will be required to demonstrate adequately the anti-decay effect of the fluoride added to the Grand Rapids water supply," referring to the US Public Health Service fluoridation study project begun in January 1945.[5] The Bureau of Water Supply was prepared to proceed. Mr. Edward S. Hopkins, the filtration engineer, had surveyed fluoridation procedures as practiced in Wisconsin, Michigan, and Illinois, and decided that hydrofluosilicic acid (H_2SiF_6) was the best fluoride source for Baltimore. Unlike sodium fluoride and sodium fluosilicate, both commonly employed at the time, fluosilicic acid was relatively cheap and was a liquid. It did not have to be subjected to the onerous process of being dissolved in water before being introduced into the water supply. It was available locally from the Baugh Chemical Company and the Davison Chemical Corporation. And, it could be economically stored and controlled in the process of fluoridation. According to the water engineer, however, chemical and equipment could be delayed for months in the prevailing war situation.

On June 29, 1951, Baltimore newspapers published a letter to Mayor D'Alesandro from Surgeon General Leonard A. Scheele, M.D.: "It is my view that the City of Baltimore can no longer afford to postpone fluoridation of the drinking water supply." The process had been approved by every creditable organization in the fields of dentistry and public health. Yet, on the same date, the mayor received a communication from Health Commissioner Williams:

> While in general the reports of experience in other communities are favorable....Baltimore should not take this step in the immediate future....There remains some considerable doubt in the minds of leading medical and sanitary authorities on the question of possible toxicity of a cumulative nature for adults.

The commissioner recommended postponement pending a report expected before the end of the year from the National Research Council's ad hoc Committee on Fluoridation of Water Supplies. Williams was the only one to counsel delay among the medical and dental authorities consulted by the mayor, including the Maryland State Department of Health, Med Chi, and the University of Maryland. No city with more than 173,000 population had yet adopted the measure.

Assuring safety

The awaited National Research Council report was noted as a special dispatch to the *Evening Sun*, November 29, 1951:

> Fluoridation of public drinking water to reduce tooth decay as called for by a $90,000 plan in Baltimore is safe and practicable, according to a report by a special committee of the National Research Council.

A follow-up editorial expanded the findings:

> The committee reports that children in communities where there are small amounts (one part per million) of a fluoride in the drinking water have from one-third to one-half as much tooth decay as children exposed to fluorine-free water. The increased resistance to decay, the committee found, carries into adult life to an "appreciable degree." The fluoride can be added to fluorine-free water supplies with the same beneficial effects and, if handled wisely, should not have harmful effects on the human system.

The reporting committee was headed by Dr. Kenneth F. Maxcy, professor of epidemiology at the Johns Hopkins School of Hygiene and Public Health. Among its 10 members were Dr. A. McGehee Harvey, professor of medicine, and Dr. Abel Wolman, professor of sanitary engineering—both from the same prestigious university. The commissioner of health was satisfied. On November 30, he communicated the entire report to the mayor, with comment:

> This report, which is very satisfactory, has just reached me during the past half-hour, and I feel sure that now it will be well, on the basis of these findings, for Baltimore City to move forward with the plan you have sponsored so actively to take this important public health step.

Before the day's end, Mayor D'Alesandro requested authority from the Maryland State Board of Health to add fluoride to the city's water supply.

While the Bureau of Water Supply was finalizing preparations, a dispatch from Philadelphia appeared in Baltimore papers. The date was December 29, 1951; the headline, "Fluorine Use Called Risk." Dr. Robert S. Harris of the Massachusetts Institute of Technology had decided "much is still unknown about the long-time effects of small amounts taken every day." Fluoridation was "a calculated risk." To make matters worse, a US House of Representatives committee became involved in the debate, adding to the confusion.[6] On February 25, 1952, a resolution appeared before the Baltimore City Council (No. 506). Citing disagreement among scientists and claims of harm to persons suffering from rheumatism and arthritis, the commissioner of health and the water engineer were requested to provide "whatever information is available on this treatment by fluoridation of city water supplies."

Dr. Huntington Williams and Mr. Joseph S. Strohmeyer, who had succeeded Mr. Leon Small in the post of water engineer, appeared before the Baltimore City Council's health

committee in an open hearing conducted March 3. The commissioner presented a prepared statement.[7,8] This and a second hearing four days later were dominated by about 80 highly vocal and determined opponents who vehemently berated fluoridation as an insidious socialistic plot to use a rat poison and an insecticide to perpetrate every imaginable bodily injury upon the populace—"mass medication," "a fifth column," "pagan," "unconstitutional." Dentists obviously had a vested interest in the chemical industry. In rebuttal, reason and truth were patiently projected into the proceedings by Commissioner Williams and Dr. Myron S. Aisenberg, professor of pathology from the University of Maryland dental school. Copies of the National Research Council report and a health department issue of *Fluoridation Questions and Answers* were distributed to interested attendees.

Surmounting the opposition

Ignoring an October 1951 request from the Coordinating Council of the Baltimore Public School Parent-Teacher Organizations for "immediate action on the fluoridation of the public water supply of Baltimore City" and the December 1951 endorsement of the principle of fluoridation by the American Medical Association, opposition members of the Baltimore City Council persisted with yet another resolution, No. 533, introduced March 10, 1952. Citing "uncertainty as to the wisdom of placing fluoride in the water supply," the commissioner of health and the water engineer were "requested to delay the fluoridation....until additional information has been secured....to determine whether it is a wise step to take...."

On March 19, the Baltimore City Council's health committee conducted its third hearing in less than two weeks. Physicians and dentists in opposition to the plan were especially invited. None had appeared before, and none did at this hearing. Instead, an impressive array of health professionals and authorities in defense of the measure were heard, among them were Dr. A. McGehee Harvey, who had participated in the National Research Council study; Dr. Francis A. Arnold, Jr., deputy director of the National Institute of Dental Research (NIDR) and veteran of numerous Public Health Service studies of the effects of fluoride-bearing waters; Dr. Isidore Zipkin, an NIDR biochemist; Dr. Robert H. Riley, director of the Maryland State Department of Health; and Dr. Dean Roberts, his deputy.

Four days later, Baltimore City Council Resolution No. 533 was defeated by a vote of 17 to 4. A March 26 editorial aptly commented:

> The contest, in short, has been decided, and it turned out to be no contest. That being so, there is no legitimate reason to postpone the use of fluorine.

However, there was. On April 5, the Bureau of Water Supply was reported to be delaying the procedure for want of rubber-lined 5,640-gallon tanks in which to store the hydrofluosilicic acid. Coincidentally, two taxpayers, Ian Ross MacFarlane, a radio personality, and one Harry C. Hoffman, had filed a complaint in court: the "introduction of fluorine into the water supply would be prejudicial to health, to religious rights, and to other rights guaranteed by the Constitution of the State of Maryland." The mayor, the Baltimore City Council, the health commissioner, and the water engineer were named as defendants. Again, it was wait and see.

While waiting, the Maryland State Dental Association convened in Baltimore and was addressed on May 26, 1952, by two recognized experts in regard to the effects of fluoride ingestion and exposure: Dr. Harold C. Hodge, professor of pharmacology and toxicology at the University of Rochester, and Dr. Reidar F. Sognnaes, associate dean of the Harvard Dental School. The press was interested. Pertinent questions were answered. There was "absolutely no basis" for rumored complaints of fluoride-caused arthritis, rheumatism, high blood pressure, or kidney or bone disease. On the other hand, there was plenty of need for fluoridation.

The MacFarlane-Hoffman injunction suit was heard by Judge Michael J. Manley of the Circuit Court of Baltimore City during November 6 and 7, 1952. As in the case of the three Baltimore City Council hearings the preceding March, recognized authorities testified against allegation of harm. Again, NIDR sent Drs. Arnold and Zipkin to the defense, and the University of Maryland sent its professor of general and oral pathology, Dr. Aisenberg. The Maryland State Department of Health was again represented by its director, Dr. Riley, this time with Dr. Perry S. Prather as deputy. Other important witnesses included Dr. Alan M. Chesney, dean of the Johns Hopkins School of Medicine and president of Med Chi; Dr. Maurice C. Pincoffs, professor of medicine at the University of Maryland and member of the Maryland State Board of Health; Dr. J. Roy Doty, secretary of the ADA's Council on Dental Therapeutics; Dr. Huntington Williams; and Mr. Joseph S. Strohmeyer. Mr. Harry C. Hoffman, a Christian Scientist, alone defended his complaint; at no time did Mr. Ian Ross MacFarlane appear in the court room. On November 12, Judge Manley dismissed the complaint, charging court costs to the plaintiffs.[9] Assistant City Solicitor F. Clifford Hane had won his case.

Realizing the goal

Two years after Mayor Thomas D'Alesandro, Jr., had ordered it, and two weeks after Judge Michael J. Manley had dismissed the injunction suit, adjustment of the fluoride content of Baltimore's water supply to the optimal level for dental health—one part fluoride to one million parts of water—was finally realized. At 3:00 p.m., Wednesday, November 26, 1952, at the Montebello water treatment plant, the mayor ceremonially pushed the starter button in the presence of the health commissioner; the water engineer; the city solicitor; and representatives of the Maryland State Department of Health, city and

state, medical and dental societies, various municipal agencies, and interested citizen groups (**Figure 1**). He addressed them:

> What we do here today may well be termed by future generations one of the most important events in the history of our city. By adding fluorine to our water, an advance strongly recommended both by the dental and medical professions, we begin today to benefit thousands of young children, and in the future hundreds and thousands of boys and girls will be benefited.
>
> Exhaustive tests by the United States Public Health Service have demonstrated conclusively that fluoridation of the drinking water supply will reduce dental decay up to 60%. Thinking in terms of toothaches alone, the benefits to children will be enormous. And fluoridation will have a very beneficial effect on the financial headaches of parents.
>
> Our medical and dental authorities tell us that the addition of fluorine to the drinking water has the direct result of strengthening the enamel which coats our teeth. It is as simple as that. Yet this greatly desired result is attained without any harmful effect on the body.
>
> Proof of this has been demonstrated again and again in communities which have fluorine in their waters naturally and in quantities much larger than we shall add. As a matter of fact, there are several such communities right here in Maryland.
>
> Baltimore, I believe, becomes today the largest city in the world which is fluoridating its water for the benefit of its citizens, and I like to think of what is happening here as a sort of Thanksgiving Day present to the people of Baltimore and to those county residents served by the city water supply system.
>
> We are trying to put Baltimore in the forefront in every way. We want the best health facilities—we want the finest public schools—we want the smoothest streets—and we want the best of everything for the people of Baltimore at the lowest possible cost in taxes.
>
> There was a little opposition—misguided opposition—to fluorine. But the overwhelming majority of our people, the parents of Baltimore who think of the well-being of their children, is solidly behind fluorine. The support of the people and the powerful support of the medical and dental professions have made this day possible.
>
> I believe with all my heart that in the fluoridation of our water we have something wonderful to be thankful for, in addition to all the other blessing we enjoy as American citizens.

Figure 1. Baltimore officials convene in the Montebello water treatment plant on November 26, 1952, to initiate flouridation. From l to r, Thomas N. Biddison, city solicitor; Huntington Williams, M.D., commissioner of health; Joseph Strohmeyer, water engineer; and Mayor Thomas D'Alesandro, Jr.
(Photo courtesy of Baltimore City Health Department, from its 1953 annual report.)

Baltimore in 1952 was a city of 970,000 people, seventh largest in the nation. Its water supply system served another 210,000 people in surrounding counties. The first year (1953), cost of fluoridating the 200 million gallons of water treated daily was $93,300—7.9 cents per person.[10] In 1991, the system served 1.6 million people, the output treated was 260 million gallons daily, and the fluoridation cost was $321,400 or 20 cents per individual.

For this expenditure, the dental health of Baltimore citizens has dramatically improved. Before fluoridation, a school child free of tooth decay was a rarity. Today, fully 50% of the school population has never had a dental cavity, and children who have are less affected—fewer lesions, fewer teeth lost, far less restoration expense. It is estimated that among adults aged 60 or over, wherein one-half were edentulous before fluoridation, this proportion is now one-third.

Because of the two-year delay in carrying out Mayor D'Alesandro's fluoridation order, Baltimore was preceded in the initiation by Indianapolis, Indiana, August 1951; Hagerstown, Maryland, December 1951; Miami, Florida, April 1952; Washington, DC, June 1952; San Francisco, California, August 1952; and Richmond, Virginia, early November 1952.

Health indicators of substance abuse problems in Baltimore

Jo DeWeese, Ph.D., and Hongji Liu, M.A.

From the Baltimore Substance Abuse Systems, Inc., Baltimore, Maryland, where Dr. DeWeese is former executive director and Ms. Liu is a statistician.

ABSTRACT: *Selected health indicators were examined for which Baltimore-specific data were available, including substance abuse treatment admissions, AIDS (acquired immunodeficiency syndrome) case reports, and drug-related emergency room visits and deaths. All indicators reflected high levels and increasing rates of substance abuse problems in Baltimore. Drugs of choice most likely to result in adverse effects were heroin, cocaine, and alcohol—often in combination. The African-American population in Baltimore is disproportionately affected by substance abuse. Emerging drug use patterns are examined, and health service and policy issues are discussed.*

While the decreasing drug abuse trends as depicted in national surveys in the 1980s were encouraging, they did not reflect the situations in many major metropolitan areas nor in poor central-city populations in particular. Substance abuse is dynamic by nature, constantly shifting in terms of drugs of choice, patterns of use, locations, and demographic characteristics of those involved. Often, substance abuse data are not comparable between sources; the lack of standardization frequently restricts systematic comparisons or meaningful conclusions.

Despite these limitations, analyses of various drug indicators demonstrated that the drug problem is frequently greater in urban areas, and that substance abuse patterns differ from city to city at any given time. Policymakers must use numerous indicators and retrieve data from various sources to examine the nature and extent of alcohol- and drug-related problems. Data on people affected by *negative consequences* of drug abuse may help identify those most *severely affected* by drug abuse, as well as the patterns of use and the drugs most likely to result in adverse effects.

Local data are essential for local policy formulation. Selected health indicators of drug abuse for which Baltimore data are available include

treatment admissions; acquired immunodeficiency syndrome (AIDS) case reporting; and emergency room (ER) visits and deaths related to substance abuse. However, no single entity has monitored routinely all these health indicators or used them to provide information on Baltimore substance abuse trends and patterns.

Demographics. The Baltimore City population has decreased over the last few decades. According to 1990 census data, Baltimore's population is 736,014—15% of the population of Maryland. The majority (59%) of Baltimore residents are African-American, 39% are white, and 2% are other. Forty-seven percent are male and 53% are female. Over half (51%) are between the ages of 25 and 64; of the remainder, 24% are under 18, 11% are between 18 and 24, and 14% are over 64. Baltimore's median annual household income is $24,045—the lowest in the Baltimore metropolitan area. Sixteen percent of city households are dependent on some form of public assistance, compared with 4% in the surrounding metropolitan area. Forty-four percent of Maryland households receiving public assistance are located in Baltimore. Thirty-three percent of Baltimore households have annual incomes below $15,000; 56% of metropolitan area households with an annual income under $15,000 are in the city.

Service structure. Interpretation of substance abuse treatment data requires an understanding of the service structure of the Baltimore substance abuse treatment system. The Maryland Alcohol and Drug Abuse Administration (ADAA) and the Baltimore City Health Department have a memorandum of understanding outlining their roles and responsibilities for administering the Baltimore treatment system. The state certifies programs and approves the sliding scale that publicly funded programs use to charge fees according to an individual's income. Publicly funded substance abuse treatment programs, for purposes of this article, are those that receive federal block grant and state general revenue funding from the Maryland ADAA through the Baltimore City Health Department and, therefore, are required to provide treatment services without regard for a patient's ability to pay. Forty-eight publicly funded treatment programs operate in Baltimore; an additional 13 programs operate with private funds. The health department provides the services directly in 3 of the 48 public programs and contracts with nonprofit organizations for the remaining 45.

Treatment slot static capacity is the number of persons who can receive treatment simultaneously at a given point in time. The static capacity in Baltimore's publicly funded treatment system increased from 4,439 in fiscal year* 1989 (FY89) to 5,392 in FY92 due to reductions in the state's general revenue funding. Treatment slot capacity is not reported by Baltimore's privately funded programs. Of the 5,392 publicly funded slots available in FY92, only 193 residential substance abuse treatment beds were in the city; the remaining 5,199 slots were for outpatient treatment. Of these outpatient slots, about half were in programs providing methadone treatment for patients whose primary drug of abuse was heroin or other opiates; the remaining slots were in programs serving those with problems relating to the abuse of alcohol or any other drug, including opiates, or combinations of substances.

* *Fiscal year for Substance Abuse Management Information System (SAMIS) data is July 1 through June 30, while Baltimore AIDS surveillance and DAWN (Drug Abuse Warning Network) data follow the calendar year.*

Data sources

All Maryland-certified treatment programs for alcohol and other drug abuse are required to report admission and discharge data to the Substance Abuse Management Information System (SAMIS), ADAA, Department of Health and Mental Hygiene (DHMH). While the majority of persons who abuse alcohol or other drugs do not enter the treatment system, data on those admitted provide an excellent information source on the drug problem because they reflect the substantial number of identified abusers with problems severe enough to result in their voluntary or involuntary admission to the treatment system.

Data reported to SAMIS by ADAA-certified Baltimore treatment programs for July 1, 1987, through June 30, 1992 (FY88 through FY92), were analyzed on the Baltimore Substance Abuse Systems, Inc. computer network, using the Statistical Package for Social Sciences (SPSS) software. For SAMIS data, treatment episodes (the time between admission and discharge) are unduplicated, but each treatment episode does not necessarily represent a unique individual patient. Up to three *mentions* (a mention is a substance that is reported as the primary, secondary, or tertiary problem) for each admission may be reported, so the number of mentions exceeds the number of treatment episodes.

Data on AIDS case reports were extracted from the December 31, 1992, *AIDS Statistical Summary,* published monthly by the Baltimore City Health Department.[1] This publication of AIDS surveillance data includes cumulative cases; race, sex, and transmission mode by year of initial diagnosis; case fatality rates; and deaths by half-year and age group. AIDS risk categories reported include: (1) homosexual or bisexual men; (2) injection drug users (IDUs); (3) homosexual or bisexual IDUs; (4) hemophiliacs; (5) heterosexuals with infected partners; (6) recipients of transfusion of blood or blood products; (7) children with a parent at risk or having AIDS/HIV (human immunodeficiency virus)—a vertical mode of transmission in pediatric cases; and (8) none of the above or other. For this article, categories were combined into three groups: (a) homosexual or bisexual men; (b) IDUs including the IDU group 1 above, the homosexual or bisexual IDU group 3 above, and the vertical transmission group 7 above; and (c) all other patient groups including 4,5,6, and 8 above. Since calendar year 1992

data may be revised substantially as additional diagnoses continue to be confirmed, further transmission data were plotted through 1991 only.

Other substance abuse indicators are reported by the Drug Abuse Warning Network (DAWN), which is funded by the National Institute on Drug Abuse (NIDA) with participation from the Drug Enforcement Administration. DAWN data, collected from a sample of hospital ERs and from medical examiners located throughout the United States, pertain only to the substance-abusing population who seek emergency medical treatment or who die in a way that brings the death to the medical examiner's attention. The Baltimore metropolitan area, rather than Baltimore City alone, is among the primary metropolitan statistical areas included in the DAWN system. DAWN data were obtained from published NIDA reports.[2,3] As with treatment program data, the number of DAWN ER episodes is not synonymous with the number of individuals involved in drug abuse. An episode is counted in the DAWN system for each patient who visits a DAWN ER room and mentions drugs in relation to the presenting medical crisis. In contrast, deaths are counted as the number of individuals whose cause of death was directly related to drug abuse as determined by a medical examiner. Up to four substances can be specified for each episode and six substances for each death.

Efforts by NIDA to transform the DAWN system into a national probability sample for ERs at the national and metropolitan levels resulted in a new sample of ERs being used from 1990 forward. Starting with the 1991 annual DAWN report, ER statistics are nationally representative weighted estimates. Trend tables in the 1991 report provide weighted estimates for 1988 through 1992 that can be used in year-to-year comparisons for selected data disaggregations. For Baltimore, procedural changes affected the level of reporting, and the completeness of reporting varied over time for several participating hospitals. These factors influenced the data for several months in 1989 and for 1990. Therefore, while trends data appeared unaffected, the observed increases for the area as a whole might be less if complete data were available from all hospitals and if no procedural changes had occurred.

Results

Treatment availability. The number of persons able to obtain alcohol and drug abuse treatment in Baltimore is dependent, in part, on the number of slots available in appropriate treatment modalities. Lack of sufficient slots limits the number of admissions or persons receiving treatment. In the aggregate, Baltimore's publicly funded treatment programs consistently operate very near to or above static capacity, especially the methadone programs whose average treatment slot utilization rates ranged from 99% to 116% over the five-year period examined (1988–1992). On average, the number of patients in treatment in Baltimore's publicly funded programs on a daily basis tracked the available static slot capacity, increasing from 4,943 in FY89 to 5,130 in FY90 and to 5,328 in FY91, and then decreasing to 5,079 as slot availability decreased in FY92. Approximately one-fifth of substance-abusing patients treated in Baltimore receive services from privately funded programs. Baltimore's treatment capacity in privately funded programs, proportional to slot capacity in publicly funded programs, is substantially less than in the remainder of Maryland; nevertheless, Baltimore's private treatment programs are often not fully utilized because of the predominance of indigent patients seeking services in the city.

As the median duration of substance abuse treatment episodes is often less than one year, the number of patients admitted and treated annually typically exceed the static slot capacity. The number of patients *admitted* to Baltimore treatment programs has steadily increased from 13,502 in FY88 to 16,327 in FY92; the number *treated* over the same period increased from 18,793 to 22,234. While Baltimore has only 15% of the Maryland population, Baltimore programs served 37% of Maryland's substance abuse treatment patients in FY92.

Treatment admissions by race. From FY88 through FY92, the number of white patients admitted for treatment in Baltimore steadily declined from 4,280 to 3,411, while the number of African-Americans increased from 9,128 to 12,818. The number of white females remained stable at approximately 1,000 annually. The greatest percentage change was in the number of African-Amercian females admitted, which nearly doubled from 2,264 in FY88 to 4,211 in FY92. Fifty-three percent of the 16,327 patients admitted for treatment in Baltimore in FY92 were African-American males, 26% were African-American females, 14% were white males, 7% were white females, and 1% were other. Thus, African-Americans and males were overrepresented in treatment, and whites and females were underrepresented compared with their proportions in the Baltimore population as a whole.

Treatment admissions by age and education. The age distribution of those admitted in FY92 was generally proportional to the Baltimore population's age distribution; the exception is an overrepresentation of those 18 to 25 years of age and a comparable underrepresentation in the under-18 years of age group, reflecting the usual age of onset of substance abuse. Of the 16,327 patients admitted in FY92, nearly one-fourth were between 26 and 30 years of age, and nearly half were between 31 and 44. Twelve percent completed less than the ninth grade, 35% completed the ninth through eleventh grade, and another 38% graduated from high school. Thirteen percent completed some college, and only 2% graduated from college or beyond. Of the 15,317 admissions who were over age 18 years of age, 46% were unemployed and not seeking employment, 30% were unemployed, 4%

were employed part-time, and 20% were employed full-time.

Most commonly abused drugs. SAMIS records a maximum of three substances mentioned at admission as the primary, secondary, and tertiary drugs of abuse. For FY92, **Figure 1** shows that opiates, usually heroin, were the most frequent primary drugs of abuse, followed by alcohol, cocaine, and marijuana as a distant fourth. Cocaine, including crack, was abused as the primary drug about half as often as heroin, but was the secondary drug of abuse far more often than any other substance, frequently in connection with heroin abuse. Inhalants (ranking fifth) were the primary drug for 43 patients, with every other primary drug being cited even fewer times. The small number of persons with primary inhalant or hallucinogen problems were generally youth, with a mean age of 18. When total substance mentions are examined for FY92 admissions, cocaine, at 9,968, was the most frequently mentioned, followed by opiates at 9,385, alcohol at 8,403, and marijuana at 3,239 mentions—a different ranking of the top four primary drugs abused. All other substances were mentioned fewer than 400 times each.

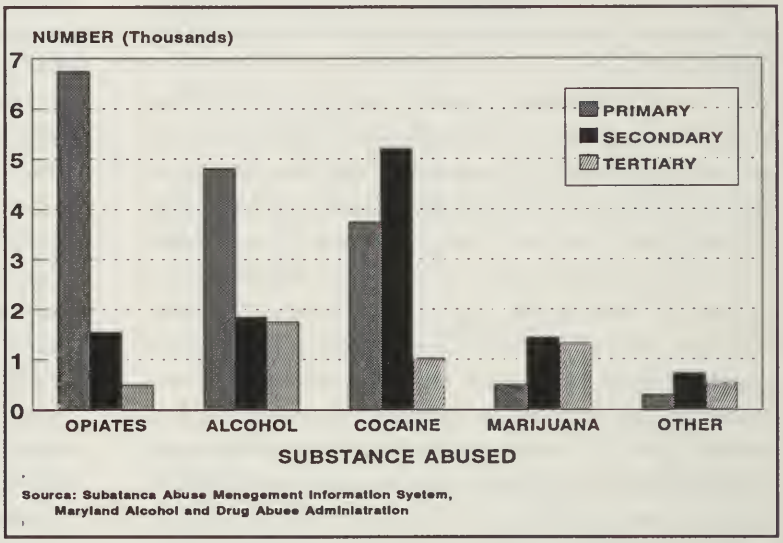

Figure 1. Substances abused by patients admitted to Baltimore treatment programs, fiscal year 1992.

Increasingly, patients mentioned alcohol in combination with other drugs or the use of two or more drugs concurrently. From FY88 to FY92, the percentage of patients admitted who used only alcohol declined by 50%, while the percentage who used two or more drugs increased by 50%. This increasing polydrug abuse was paralleled by an increase in medical problems, HIV infection and AIDS in particular, among substance abusers seeking treatment.

Figure 2 shows that while cocaine mentions increased 83% and heroin mentions increased 64%, the number of alcohol and marijuana mentions did not change significantly for patients admitted from FY88 through FY92. The relative ranking of substances mentioned by adolescents 18 years of age or younger who were admitted to treatment is different than for adults, as shown in **Figure 3**. Adolescents admitted in FY92 were most likely to mention alcohol, followed by marijuana, cocaine, and heroin. From FY88 to FY92, adolescents' substance mentions at treatment admission decreased substantially for marijuana and increased slightly for alcohol, cocaine, and heroin.

Intravenous drug use. IDUs who share injection equipment are of particular concern because of their risk for contracting and transmitting HIV. In FY92, 15,881 IDUs received substance abuse treatment in Maryland. Sixty-two percent of these, or 9,852 persons, were treated in Baltimore. The number of patients admitted to treatment in Baltimore who use an intra-

venous administration route increased steadily from 5,471 in FY88 to 6,412 in FY92. **Table 1** shows the race and gender by age of IDUs admitted in Baltimore in FY92. Over half were between the ages of 31 and 40; 53% were African-American males; 27% were African-American females; 12% were white males; and 8% were white females. **Table 2** shows the number of mentions (maximum of three per patient) of drugs used intravenously by patients admitted to Baltimore treatment programs from FY88 through FY92. Heroin or other opiates and cocaine were by far the most likely drugs used intravenously, frequently in combination.

Table 3 shows the route of cocaine administration for patients admitted from FY88 through FY92. While the total number of cocaine mentions nearly doubled over this period, the percentage of intravenous administration cocaine mentions decreased from 62% to 46%, and the percentage of mentions for smoking crack increased from 12% to 33%. It is important to note that the *absolute* number of intravenous cocaine mentions increased from 3,406 to 4,539 over the period analyzed, even though the *percentage* decreased. The number of heroin mentions for patients admitted to treatment in Baltimore also increased substantially from 5,353 in FY88 to 8,781 in FY92. Interestingly, a simultaneous decrease in intravenous injection and increase in inhalation were observed, with the intravenous route of administration dropping from 88% in FY88 to 66% in FY92, and the inhalation route of administration increasing from 11% in FY88 to 30% in FY92 (**Table 4**). Those using an inhalation route tended to be younger (**Table 5**) and to enter

treatment earlier. For heroin-abusing patients admitted to treatment in FY92, those who used an inhalation route and who had no prior treatment waited 5 years between first heroin use and treatment admission compared with 12 years for those who injected heroin.

HIV and AIDS. Sharing of injection equipment is a major risk factor for HIV and AIDS. For cumulative cases of AIDS from January 1, 1981, through September 30, 1992, 67% of the Maryland cases in which injection drug use was a risk category were Baltimore residents. Of the various risk categories, injection drug use was a factor in half the 2,490 adult or adolescent cumulative cases and in 88 of 95 pediatric cases among Baltimore residents through December 31, 1992; homosexual or bisexual men who were not IDUs comprised an additional 934 cases or 38% of the total. Of the 2,490 adult and adolescent cases, 1,996 were men and 494 were women. At the time of initial diagnosis, 95 cases were age 12 or under, 11 were 13 to 19 years of age, 468 were 20 to 29, 1,166 were 30 to 39, 622 were 40 to 49, and 223 were over 49. Eighty percent were African-American, and 19% were white.

Figure 4 shows that the three aggregated IDU risk categories surpassed homosexuality or bisexuality alone as the most common transmission mode for new AIDS cases among Baltimore residents in 1989 (229 cases and 150 cases, respectively). **Figure 4** also shows an increasing trend for IDU-related AIDS transmission through 1991 when 303 IDU-related Baltimore AIDS cases were reported. Injection drug use is a risk factor for most new AIDS cases in Baltimore.

African-Americans in Baltimore have been disproportionately affected by AIDS relative to their percentage representation in the population (80% of cumulative AIDS cases through December 31, 1992, compared with 59% of the Baltimore

population). This overrepresentation has been even greater for new IDU-related AIDS cases; for cases diagnosed in 1991, 62% were African-Amercian males, 24% were African-American females, 12% were white males, and 1% were white females. The increasing trend for African-American females to be affected is of particular concern, in part because of transmission risk during pregnancy. For IDU-related cases diagnosed from 1988 through 1991, the percentage of new female African-American cases increased from 24% (35) to 30% (90).

Drug abuse episodes in ERs. Additional health indicators from the DAWN system have been analyzed to further define the nature and extent of Baltimore's substance abuse problem. When weighted ER-episode estimates in Baltimore are examined for 1988 through 1991, the number of drug abuse episodes increased from 4,858 in 1988, to 4,781 in 1989, to 6,222 in 1990, and to 10,902 in 1991. Of the DAWN metropolitan areas reporting, Baltimore had the largest percentage increase in drug abuse–related ER episodes from 1990 to 1991 (74%); the ER episode increase from 1990 to 1991 for the total coterminous United States was 8%. Increases in Baltimore ER episodes were similar for males (75%) and females (74%). Episodes involving African-American patients increased 88%, and those involving white patients increased 44%. Drug-related ER episodes increased 92% for patients 35 years of age or older, 82% for those 26 to 34 years old, and 50% for those 18 to 25 years old.

According to 1991 DAWN data for the Baltimore metropolitan area, cocaine is mentioned more frequently in ER episodes (6,687) than any other drug, followed by heroin (3,892), alcohol in combination with other drugs (3,115), and marijuana (355). Mentions in ERs for all four substances increased from 1988 through 1991, showing the largest percentage increases from 1990 to 1991 (**Figure 5**).

Baltimore ER mentions of cocaine increased 121% from 3,023 in 1990 to 6,689 in 1991—the second largest increase of the 21 DAWN metropolitan areas. Increases were observed in 15 of 21 metropolitan areas, with no metropolitan area showing a statistically significant decrease in cocaine mentions from 1990 to 1991. In the United States, weighted estimates of cocaine mentions increased 28% from 80,355 in 1990 to 102,727 in 1991.

Heroin ER mentions also increased in the United States from 1990 to 1991; weighted estimates changed 8% from 33,884 to 36,576. The number of heroin ER mentions in Baltimore increased 134% from 1,667 in 1990 to 3,892 in 1991—the greatest increase in the United States. Additionally, alcohol-in-combination mentions increased 69% and marijuana men-

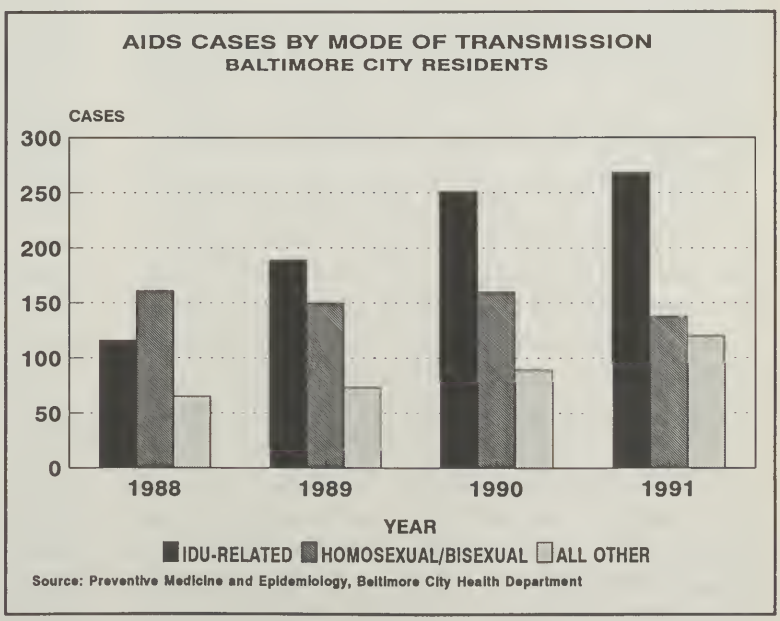

Figure 4. AIDS cases by mode of transmission, Baltimore residents, 1988-1991.

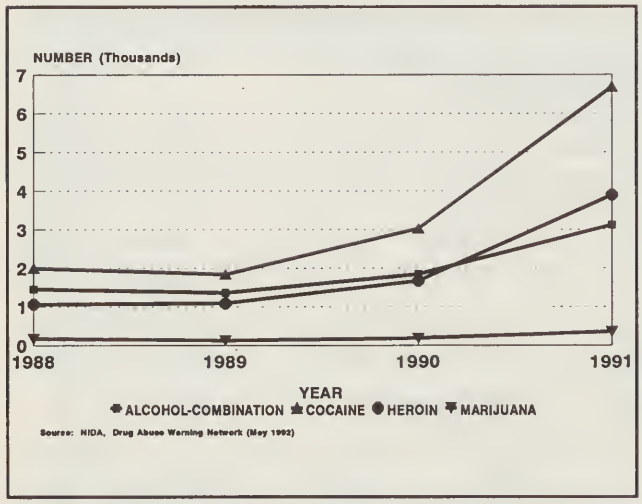

Figure 5. Number of substance-related ER mentions in the Baltimore metropolitan area, 1988-1992.

tions increased 91% from 1990 to 1991 in the Baltimore metropolitan area.

Not only are the large percentage increases in ER episodes and in various drug mentions from 1990 to 1991 within the Baltimore metropolitan area noteworthy, but the number of ER episodes and drug mentions are substantial when compared with other cities and the entire United States. Rates per 100,000 population for those age six or older were computed for weighted estimates of ER episodes and drug mentions. The number of drug-related ER episodes per 100,000 US population in 1991 was 179; San Francisco had the highest total of the 21 metropolitan areas at 831, followed by Newark at 538, New Orleans at 533, and Baltimore at 500. More significantly, Baltimore ranked second of all 21 metropolitan areas in 1991 for cocaine-related ER mentions and second for heroin-related ER mentions per 100,000 population. Cocaine mentions per 100,000 population for the United States were 45; New Orleans was highest at 323, and Baltimore followed at 310. US heroin mentions per 100,000 population were 16, Seattle reported 223, and Baltimore 180.

Drug-related deaths. Baltimore had the eighth highest rate (57) of drug-related deaths per thousand deaths in 1991—higher than the DAWN average of 45 per thousand. Drug-related deaths increased 10% across the 27 DAWN metropolitan areas from 1990 to 1991, with some cities showing increases and others decreases. Of all DAWN areas, Baltimore had the largest increase in drug-related deaths (177%) from 1990 to 1991. The increase in deaths was approximately equal between males (176%) and females (181%). Drug-related deaths of African-Amercians increased 262%, and deaths of whites increased 106%. Deaths of persons 18 to 25 years of age increased 133%, deaths of persons 26 to 34 years of age increased 250%, and deaths of those over 34 increased 142%.

Heroin-related deaths increased 16% across the areas reporting, with the largest increases occurring in Baltimore (268%, from 47 in 1990 to 173 to 1991). Cocaine-related deaths also increased 20% overall from 1990 to 1991, and the greatest increase again occurred in Baltimore (254%, from 35 in 1990 to 124 in 1991). Baltimore deaths involving alcohol in combination with other drugs also increased from 1990 to 1991 (207%, from 41 to 126).

Discussion

Substance abuse is a major problem in Baltimore. Health indicators were compared, and trends and patterns in alcohol and other drug abuse in Baltimore from 1988 to 1992 were analyzed. Adverse health consequences connected to substance abuse, particularly heroin and cocaine use, alone or in combination, continued to increase in Baltimore. Problems related to alcohol or alcohol in combination with other drugs generally ranked third, and problems related to marijuana ranked a distant fourth. Baltimore has one of the largest and most longstanding heroin abuse problems of any major metropolitan area in the United States. The crack epidemic began late in Baltimore relative to other cities, but crack-related problems continue to escalate. Multiple drug use has become increasingly common, as have multiple health and social problems in persons seeking substance abuse treatment.

Data analyses show, in general, that (1) increasing numbers of persons were admitted to treatment in Baltimore from FY88 through FY92; (2) the four leading drugs abused by persons admitted to treatment were heroin, cocaine, alcohol, and marijuana—the order of the first three changed depending on the analysis, and marijuana ranked a distinct fourth except for adolescents in treatment; and (3) the number of patients admitted to treatment for alcohol and for marijuana abuse remained relatively stable from FY88 through FY92, while the number mentioning cocaine and heroin increased steadily over the same period.

Several factors limit the extrapolation of substance abuse treatment system data for policy development purposes. One is the lack of enough Baltimore treatment slots to allow treatment on demand. The limitations in treatment availability overall and by specific modality limit the number of patients who can be admitted and may bias their profile. Also, those admitted to treatment are a relatively small fraction of substance abusers and, therefore, may not be representative of that population.

Baltimore has only 15% of the Maryland population, but about one-third of the persons admitted to substance abuse treatment in the state and about two-thirds of the state's IDUs in treatment. The nature and extent of injection drug use are critical concerns because sharing injection equipment is a major mode of HIV transmission. Many younger and less-experienced users in Baltimore are reporting inhalation rather than injection as the route of heroin administration. Whereas 11% of those mentioning heroin when admitted to treatment in FY88 used inhalation as the administration route, 30% of those

admitted in FY92 inhaled heroin rather than injected it. While this is positive in terms of helping to prevent HIV infection, there are still significant numbers of persons injecting drugs. Only a fraction of IDUs receive substance abuse treatment, partially as a result of the inadequate number of treatment slots. Failure to treat the addict population will result in far more costly health and social service outlays in the future.

Substance abuse treatment system data and AIDS surveillance data indicate that problems related to injection of heroin and cocaine, separately or in combination, continue to increase in Baltimore at an alarming rate. A paramount issue is the risk of HIV infection associated with sharing injection equipment and the subsequent transmission of the virus through drug or sex practices. HIV infection and AIDS have major negative effects on the health of infected individuals, substantially increase the costs of their health care, and have a heavy impact on the functioning of health care services in locations with high incidence rates. The average direct lifetime medical costs for each adult with HIV infection is between $60,000 and $100,000, while indirect costs due to lost productivity are six times as high.[4,5]

IDUs experience an exceptionally high risk of seroconversion from HIV infection. Annual infection incidence rates as high as 9% have been reported,[6–9] but seroconversion rates are lower in a given area for cohorts receiving methadone-maintenance treatment services.

DAWN data on drug-related ER visits and drug-related deaths corroborate the SAMIS treatment and Baltimore AIDS surveillance data indicating significant substance abuse problems in general and that heroin and cocaine abuse, in particular, disproportionately affect Baltimore's African-American population. Substance abuse problems continue to increase in Baltimore; they do not appear to have peaked as they may have in the remainder of Maryland and the United States. Health care providers and policymakers must recognize the enormity of the challenge substance abuse poses for Baltimore. They need to plan appropriately, especially in light of the limited and frequently decreasing resources available.

Geographic distribution of AIDS patients diagnosed at eight Baltimore hospitals

John N. Lewis, M.D., M.P.H.; Courtland F. Storck; and Thomas L. McArdell

From the Baltimore City Health Department where Dr. Lewis is assistant commissioner, Mr. Storck is chief of the AIDS Surveillance Office, and Mr. McArdell is a supervisor in the AIDS Surveillance Office.

ABSTRACT: *Since the begining of the AIDS (acquired immunodefinciency syndrome) epidemic in Baltimore, the university hospitals, particularly Johns Hopkins, have diagnosed and treated a disproportionate share of Baltimore patients. Many Baltimore community hospitals are now treating AIDS patients. These hospitals will have an increasing role in providing primary and secondary care as the epidemic expands.*

In 1981, the first Baltimore case of acquired immunodeficiency syndrome (AIDS), then known as gay-related immune deficiency (GRID), was diagnosed. At that time, this syndrome's etiology was poorly understood; the etiologic agent had not yet been identified, and little was known about its pathogenesis. Few Baltimore hospitals were prepared to deal with this epidemic's impact.

In 1985, Johns Hopkins Hospital made a commitment to serve as a referral center for AIDS cases in the Baltimore metropolitan area (Anne Arundel County, Baltimore County, Carroll County, Harford County, Howard County, and Queen Anne's County) and beyond. At the end of 1985, the virus causing AIDS had been identified, and a serologic test for infection became available. Up until that time, Johns Hopkins Hospital had been the hospital of diagnosis for 47.6% of the 105 AIDS cases reported by Baltimore health care providers.

By February 1987, the number of AIDS cases reported through 1985 had doubled, and by December 1992, Baltimore health care providers had reported 3,036 cases. As these dramatic increases occurred, more Baltimore hospitals began to diagnose AIDS cases in substantial numbers.

Faced with the rapidly growing epidemic and the need to effectively coordinate the limited resources available to treat AIDS, Mayor Kurt L. Schmoke established the Mayor's AIDS Coordinating Council in 1988 and the Greater Baltimore HIV (human immunodeficiency virus) Health Services

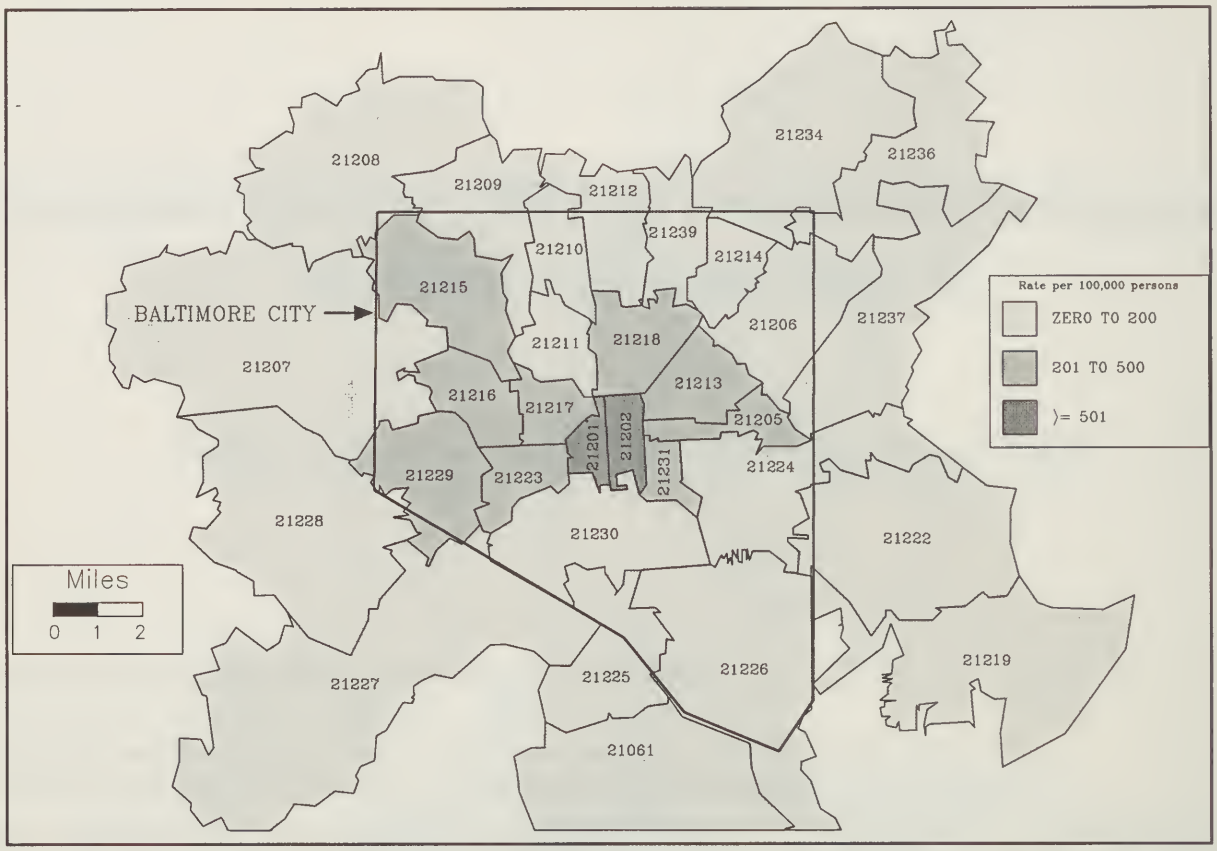

Figure 1. AIDS case rate per 100,000 population by zip code for AIDS cases reported directly to the Baltimore City Health Department.

Planning Council in 1991—the latter having the specific mission of setting priorities for the use of the Ryan White CARE Act, Title I funds. The councils' concern is the large number of HIV-infected persons in Baltimore who have limited access to hospitals and clinics providing primary care. The councils have also focused on the continuum of care for HIV/AIDS patients and have made it a priority to assure a smooth transition for HIV-infected persons from early diagnosis, through early intervention services, and through referrals, specialty consultations, and tertiary care. In 1992, the Health Resources and Services Administration (HRSA) made the assessment of continuum of care and unmet HIV service needs a requirement for receipt of Ryan White Title I funds.[1]

Methods

Maryland medical care providers who diagnose AIDS are required to report to the local (city or county) health department. In addition, Baltimore laboratories that have positive results diagnostic for AIDS-defining conditions (such as pneumocystis carinii pneumonia) must report to the Baltimore City Health Department (BCHD). Zip code of residence was tabulated for patients reported to BCHD. Cumulative incidence rates of AIDS by zip code were calculated using 1990 census figures.[2] Residence and the hospital diagnosing AIDS were counted for all patients diagnosed in Baltimore and reported through December 1992.

Results

Cumulative AIDS incidence per 100,000 population by zip code is shown in **Figure 1** for patients reported to BCHD. Incidence rates vary from zero per 100,000 in zip code 21226 to 929 per 100,000 in zip code 21201. The highest AIDS rates have been in the center of Baltimore and to the north and west of the center.

Of the 3,036 persons with AIDS reported to BCHD through December 1992, 88% were diagnosed in Baltimore's acute care hospitals. The percent distribution of residence of patients diagnosed by eight Baltimore hospitals is shown in **Table 1**, which presents data for the 32 zip codes that are included in or border on Baltimore City.

Johns Hopkins Hospital and the University of Maryland Medical Center are the two major Baltimore referral hospitals. They have been the hospitals of diagnosis for 30.8% and 15%, respectively, of the cumulative case total. They have also diagnosed patients coming from a wide geographic area. Johns Hopkins Hospital, in particular, has diagnosed patients whose residence closely parallels the incidence rates seen in **Figure 1**. Six community hospitals diagnosed 796 cases—26.2% of the total. Geographic distribution of AIDS patients at these hospitals is more limited, reflecting their community catchment areas and the level of HIV care they provide.

Boldface type indicates zip code has >10% of hospital's AIDS patients.

Conclusions

As the AIDS epidemic has evolved in Baltimore, Johns Hopkins Hospital has played a leading role—diagnosing and reporting the most patients. It is the leading referral site for tertiary and specialty care. The University of Maryland Medical Center has played an increasing role as a referral center—also serving a wide area—and is expected to expand that role further, especially given its proximity to the geographic concentration of AIDS patients in central and west Baltimore. As the epidemic continues to grow, neither of these two referral centers will be able to continue to care for such a high proportion of AIDS patients.

A large number of Baltimore community hospitals diagnose, report, and treat AIDS patients in the particular geographic areas the hospitals serve. Their share of HIV services will continue to grow, particularly in the areas of primary and secondary care. The needs of HIV-infected persons in Baltimore will be best served if diagnostic, early intervention, and primary care services can be provided to these persons in or near the communities where they live. Community hospitals and clinics should expand their services in these areas. It may be that Johns Hopkins Hospital and the University of Maryland Medical Center should limit primary care service expansion while taking on a tertiary and specialty consultative role for an expanding number of patients in the later stages of illness.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

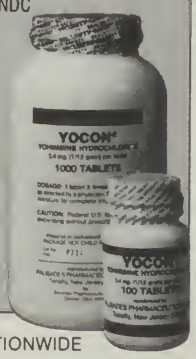
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Prevalence of human immunodeficiency virus-1 infection in a Baltimore acute care hospital

Claudia J. Zuckerman, M.H.S., and Carolyn F. Masters, M.P.H.

Ms. Zuckerman and Ms. Masters are health professionals in the Division of Preventive Medicine and Epidemiology, Baltimore City Health Department.

ABSTRACT: *In conjunction with the Centers for Disease Control and Prevention's (CDC's) national Sentinel Hospital Surveillance System for HIV (human immunodeficiency virus) Infection, we conducted unlinked (anonymous) testing of a systematically selected sample of blood specimens for HIV-1 antibodies to assess the HIV-1 infection level in an urban hospital's catchment population. We excluded specimens from patients with admitting diagnoses often associated with HIV infection. Of the 5,350 specimens tested between April 1988 and October 1989, 106 (2%) were HIV-1 seropositive. HIV-1 seroprevalence in female patients was 1%, and in male patients, 3%. Those 25–44 years of age showed the highest seroprevalence (3.7% in all patients: 6.6% in male patients, 1.1% in female patients). These results demonstrate a high HIV-1 infection level in this patient population and suggest Baltimore hospitals should evaluate the impact and costs of developing routine HIV counseling and testing programs for their patients.*

Between 1981 and 1990, the first 10 years of the acquired immunodeficiency syndrome (AIDS) epidemic, 161,073 cases of AIDS were reported to the Centers for Disease Control and Prevention (CDC).[1] During the same time period, 3,174 cases were reported in Maryland.[2] Baltimore accounted for 1,499 (47%) of these reported cases. The AIDS epidemic has had the greatest impact on young adults. AIDS is one of the leading causes of death in the United States among persons 25–44 years of age.[3] In Baltimore, between 1987 and 1989, the mortality attributable to human immunodeficiency virus-1 (HIV-1)/AIDS among residents ages 25–44 years more than doubled.[4]

The retrovirus HIV-1 is responsible for the majority of HIV infections in the United States. In this report, "HIV" refers to the HIV-1 retrovirus.

Since 1983 and 1989, respectively, AIDS and symptomatic HIV infection have been reportable illnesses in Maryland (Code of Maryland Regulations, 10.06.01). Asymptomatic HIV infection, however, is not captured by this surveillance system. Epidemiologic patterns among persons diagnosed with AIDS or symptomatic HIV infection today do not reflect the current HIV transmission dynamics.[5] Because of the long asymptomatic period of HIV infection, AIDS/symptomatic-HIV surveillance more clearly reflects the HIV transmission level from several years past. For effective HIV health care planning and policy making, AIDS case data and an estimate of the current HIV-infection burden are needed.[6]

In late 1987, CDC designed and implemented the family of HIV seroprevalence surveys to complement AIDS case reporting.[7,8] These surveys represent a national ongoing sentinel surveillance system for HIV infection based on standardized, anonymous survey and serologic testing procedures across geographically diverse US metropolitan areas. These surveys estimate HIV infection prevalence in clinic (drug treatment, tuberculosis, sexually transmitted disease, and women's health) and hospital settings. CDC instituted its hospital-based surveys under the Sentinel Hospital Surveillance System (SHSS) for HIV Infection. The clinic-based seroprevalence estimates are limited in their generality because they monitor narrowly defined groups of people receiving health care, the majority of which are at high risk for HIV infection.[9] Because patients are admitted to a hospital for varied reasons, many of which are unrelated to HIV infection or associated risk behaviors, seroprevalence surveys in hospital settings provide a more general "population-based" estimate of HIV infection.

Since April 1988, in conjunction with CDC's SHSS, the Baltimore City Health Department's Division of Preventive Medicine and Epidemiology conducted unlinked (anonymous) HIV-antibody testing at a sentinel hospital in Baltimore. In this report, we present the results of the first 19 months of data collection.

Methods

Survey design. In unlinked surveys, there is no interaction or intervention with patients for the purpose of the survey. Leftover serum or plasma from blood specimens drawn for routine clinical purposes are anonymously tested for HIV. HIV test results, therefore, cannot be linked to identifiable individuals. This survey methodology eliminates the informed consent requirement and, consequently, the effect of patient self-selection on HIV-seroprevalence estimates.[5,7,8,10]

Excluded were specimens from persons whose admitting diagnosis was among the following SHSS-defined "ineligible" conditions: (1) AIDS or other medical conditions commonly associated with AIDS/HIV infection; (2) conditions that might be expected to occur more frequently among HIV-infected persons, such as diarrhea, pneumonia, unexplained fever, neuropsychiatric conditions, and neoplasms; (3) conditions often associated with medical risk factors (such as hemophilia) or behavioral risk factors (such as drug abuse or sexually transmitted disease) for HIV infection; and (4) gunshot and knife wounds—conditions that have been reported in the past to be associated with higher than expected rates of HIV infection.

HIV-infected individuals, because of their HIV infection and need for additional medical services, may have presented to the hospital in greater proportion compared with other individuals from the catchment population.[9] The intent of the eligibility criteria was to reduce the overrepresentation of HIV-infected individuals in the survey.[5] Eligibility was determined solely by admitting diagnosis. Thus, persons known to be HIV-infected or previously diagnosed with AIDS were eligible if they presented to the hospital with an admitting diagnosis (e.g., broken arm) unrelated to the "ineligible" conditions.

The monthly sample quota of 300 specimens was divided equally between male and female patients and included specimens from six age groups: 0–4 years (40 specimens), 5–14 years (36 specimens), 15–24 years (50 specimens), 25–44 years (100 specimens), 45–64 years (50 specimens), and over 64 years (24 specimens). The SHSS standardized age- and sex-stratified sampling scheme yielded a sample of patients with an age distribution similar to that of the US population, thereby enabling comparisons of results across all participating hospitals.[9]

Specimen selection. Blood specimens were collected over a 19-month time period (April 1988 through October 1989). Each month, survey-eligible inpatient and outpatient serum or plasma, which was remaining after routine clinical tests, was collected until each age and sex category had been filled. In some months, an insufficient number of specimens were available to fill certain age and sex categories. Where possible, specimens in age and sex categories were over-sampled by 10%, and then some were randomly deleted.

Specimens were labeled with a nonpatient-associated survey number. Selected demographic data (e.g., age, sex, race, and inpatient/outpatient status) were retained with the specimens. No patient-identifying information (e.g., patient name or medical chart number) was linked to the specimen. Random deletions of specimens within age and sex categories further ensured patient anonymity.

Patients were included only once during a calendar year. For all specimens included in the survey, a subset of the patient's medical chart number, not linked to the survey number, was recorded, and any successive specimen with the same number sequence was excluded.

HIV-1 antibody testing. The specimens were screened for HIV-1 antibodies using a Food and Drug Administration

(FDA) licensed enzyme-linked immunosorbent assay (ELISA) (Electronucleonics, Inc., Columbia, Maryland). Specimens reactive on the first ELISA and on at least one of subsequent duplicate ELISAs were considered HIV-1 positive by the presence of at least two of the following viral proteins detected by an FDA-licensed Western blot (DuPont Company, Wilmington, Delaware) assay: p24, gp41, and gp120/160.

Statistical analysis. HIV seroprevalence is expressed as the number of specimens that were HIV antibody positive divided by the total number of specimens tested. Chi-square tests were used to determine differences in HIV seroprevalence by demographic characteristics. Odds ratios with 95% confidence intervals were calculated using the Epi Info package of statistical programs.[11]

Estimation of HIV-infected patients, ages 15–54 years, discharged in 1989. Hospital discharge data from 1989 was available for inpatients. Unlinked HIV-seroprevalence estimates for inpatients ages 15–54 years were extrapolated to hospitalized patients of the same age groups who were discharged in 1989. Age- and sex-specific seroprevalence estimates in surveyed inpatients were calculated (age groups: 15–24 years, 25–34 years, 35–44 years, and 45–54 years).

The National Health Interview Survey provided the following estimates on hospitalizations in 1988: 19,746,009 patients with 25,684,734 episodes.[12] From these data, we estimated the average annual number of discharges per patient (1.3). To estimate the number of patients in each age and sex category from our hospital discharge data, we divided the number of discharges in these categories by 1.3. The age- and sex-specific inpatient HIV seroprevalence was multiplied by the estimated number of inpatients in the corresponding age and sex category.

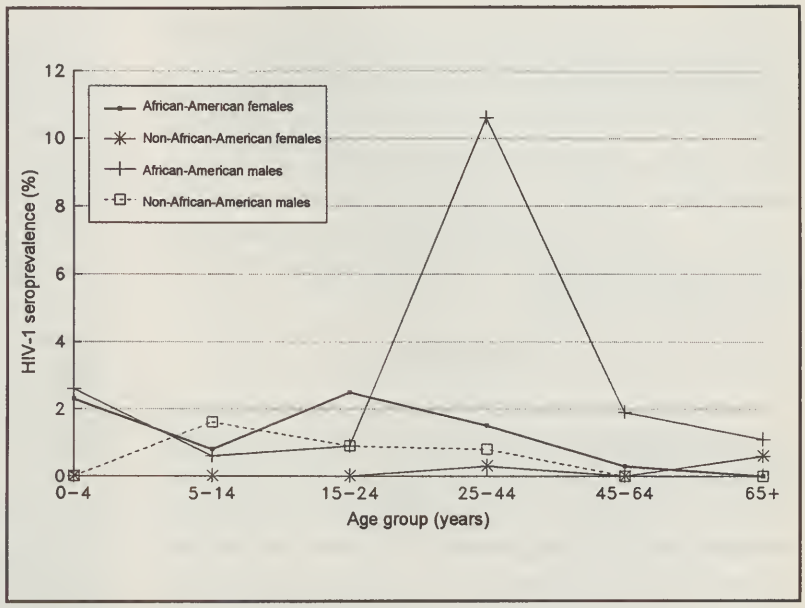

Figure 1. HIV-1 seroprevalence by age group, race, and sex.

Results

Table 1 shows the prevalence of HIV infection by age group and sex. Of the 5,350 anonymously tested specimens, 106 (2%) specimens were HIV antibody positive. A total of 28 (1%) of 2,771 specimens from female patients were HIV positive. In male patients, 78 (3%) of 2,579 specimens were HIV positive. Male patients were more likely to be HIV-infected compared with female patients (odds ratio [OR] = 3.06, 95% confidence interval [CI] = 1.94, 4.84).

Overall, the highest HIV seroprevalence was in the 25–44 year age group (3.7%). In male patients, the highest seroprevalence was in the 25–44 year age group (6.6%). The seroprevalence in this age group was significantly higher when compared with male patients in any other age group. In female patients, the highest seroprevalence was in the 15-24 year age group (1.9%). Except for the 45–64 year age group, however, the seroprevalence in the 15–24 year age group was not significantly higher when compared with female patients in other age groups.

Of the hospital patients included in the survey, 61% were African-American. In African-American patients, 99 (3%) of 3,265 specimens were HIV positive. In white patients, 7 (0.3%) of 2,085 specimens were HIV positive. African-American patients were more likely to be HIV-infected compared with white patients (OR = 9.28, 95% CI = 4.16, 21.83). **Figure 1** shows the prevalence of HIV infection by age group, race, and sex. African-American male patients, ages 25–44 years, had the highest prevalence of HIV infection (10.6%).

Of the hospital patients included in the survey, 67% were inpatients. There were no statistically significant differences in HIV seroprevalence by inpatient/outpatient status.

Table 1. HIV-1 seroprevalence by age and sex

	No. tested (% HIV-1 seropositive)		
Age	**Males**	**Females**	**Total**
0-4	232 (1.7)	194 (1.5)	426 (1.6)
5-14	232 (0.9)	178 (0.6)	410 (0.7)
15-24	339 (0.9)	565 (1.9)	904 (1.5)
25-44	933 (6.6)	1,036 (1.1)	1,969 (3.7)
45-64	566 (1.1)	530 (0.2)	1,096 (0.6)
≥ 65	277 (0.4)	268 (0.4)	545 (0.4)
Total	2,579 (3.0)	2,771 (1.0)	5,350 (2.0)

Based on extrapolation of the survey data, which measured potentially unrecognized HIV infection, to the hospital population, the estimated number of HIV-infected inpatients between ages 15 and 54 years discharged from the hospital in 1989 was 177. Of the estimated 1,777 male inpatients ages 15-54 years discharged in 1989, an estimated 71 patients were HIV-infected. During the same time period, an estimated 106 patients of the estimated 5,730 female inpatients ages 15–54 years were HIV-infected.

Discussion

The overall seroprevalence of the survey population drawn from this Baltimore hospital was 2%. The burden of HIV infection was not evenly distributed across demographic categories. Male patients were more likely to be HIV-infected compared with female patients. In male patients, the seroprevalence was highest in the 25–44 year age group (6.6%). In female patients, the peak seroprevalence was in the 15–24 year age group (1.9%). Seroprevalence was highest among African-American male patients ages 25–44 years (10.6%).

Because the specimens were systematically sampled and stratified by age group and sex, the crude seroprevalence does not represent the total hospital population's seroprevalence. The standardized protocol, however, facilitated comparisons of overall seroprevalence among SHSS-participating hospitals across the United States. HIV prevalence at this hospital (2%) was more than twice the median seroprevalence (0.7%) of the 26 hospitals participating in the national SHSS, but was similar to the seroprevalence seen in other SHSS hospitals in the northeastern and southern regions of the United States.[5]

From the seroprevalence results and the hospital's inpatient discharge data, we estimated the number of HIV-infected patients in the 15–54 year age range (the broadest age range of those at highest risk of HIV infection) discharged in 1989. An estimated 177 patients were HIV-infected. Because the survey protocol excluded those whose admitting diagnosis was associated with HIV infection, this represents a minimum number of HIV-positive patients discharged from this hospital in 1989.

The high seroprevalence and the large number of potentially unrecognized cases of HIV infection underscore the importance of following infection control procedures to increase the safety of health care workers and their patients. Several studies have demonstrated that precautions against bloodborne pathogens were not easily adopted, especially in emergency situations.[13,14] Studies such as this, however, which provide a more complete understanding of the potential number of HIV-positive patients, may serve as motivation to health care workers to protect themselves from nosocomial infections.

In establishing national health goals, *Healthy People 2000* calls for the identification of 80% of HIV-positive individuals by the year 2000.[15] Conducting screening programs in populations at risk is an efficient means of identifying those who are HIV positive. Harris et al have evaluated a Houston, Texas, hospital admission, voluntary HIV-screening program and concluded that "hospitals are an efficient and practical setting for HIV testing."[16] Lombardo et al have suggested that hospitals serving populations with high seroprevalence levels offer HIV counseling and testing to patients as part of their medical care.[17] More recently, CDC proposed strategies for hospitals without access to HIV seroprevalence data, suggesting that hospitals with one or more newly, diagnosed AIDS case per 1,000 discharges per year offer voluntary HIV counseling and testing to patients ages 15–54 years.[18]

There are many potential individual and societal benefits of HIV counseling and testing.[19] Early detection of, and medical intervention in, HIV infection increase life expectancy for those with HIV infection.[20] A counseling and testing program can prevent further HIV spread by providing pre- and post-test opportunities for educating seropositive and seronegative patients. Furthermore, monetary estimates of the lifetime cost of treating a person with AIDS have reached over $100,000.[21] Preventing new HIV infections will help control future AIDS medical care costs. The results of our seroprevalence survey suggest that Baltimore hospitals should evaluate the impact and costs of developing routine HIV counseling and testing programs for their patients.

It is important to note that prevalence is a measure of the number of individuals with a certain characteristic at a point in time. From these data, it is difficult to determine the rate at which new cases of HIV infection are occurring (incidence). Since HIV has a long latency period, the prevalence of HIV infection in a given population is affected by the length of time a population has been exposed to the virus and the relative "effectiveness" of HIV transmission in the population. While this survey demonstrates that the sampled population in this Baltimore hospital had a high prevalence of infection, especially in certain demographic subgroups, it does not shed light on the incidence of HIV infection in this population.

The SHSS is an ongoing project, with annual seroprevalence surveys being conducted in the same hospitals following standardized protocols. Trends in HIV seroprevalence can provide an estimate of HIV-infection incidence. This hospital continues to be part of the SHSS, and further analysis of HIV-infection trends in its patient population may help predict the impact of the HIV epidemic. Ultimately, these data should help prevention efforts by identifying populations into which the epidemic is moving, as well as those populations already affected by this disease.

ABSTRACT: *This article is an epidemiological analysis of Baltimore homicides between 1986 and 1990. The main findings were that young African-American males between 15 and 34 years of age are at greatest risk of homicide victimization. Homicidal events primarily occurred with handguns, in drug-related circumstances, between acquaintances, and in the western police district area. Questions are raised concerning the expansion of the public health professional's role and the use of epidemiologic data for injury prevention programs. This article is the result of a grant from the Centers for Disease Control and Prevention, Division of Injury Control, to the state of Maryland, Department of Health and Mental Hygiene, and the Baltimore City Health Department.*

Homicide is a major public health problem for African-Americans across the nation. It has been one of the leading causes of death for all African-Americans for over two decades and the primary cause of death for African-American males between the ages of 15 and 34 years of age for over one decade. Throughout America, interpersonal violence has continued to rise, affecting not only victims but their assailants, their families, and the community. Assaults have resulted in sensory, musculoskeletal, and psychological disability. Emergency room, surgery, intensive care, pharmaceutical, and inpatient and outpatient costs are staggering. The social costs of funeral expenses, crime scene clean-up, and loss of a family provider also continue to grow.

The economic costs of days off from work and school, payment for child care services, and legal and funeral expenses add to the morbidity burden. When major bodily trauma is sustained as a result of an attempted homicide, the change in quality of life results in economic drain, as well as the costs of

mental anguish associated with activity constriction and fearful ruminations over the trauma.

Public health practitioners must strive to understand better this public health problem's epidemiology and develop strategies to reduce the burden of interpersonal violence on mortality and morbidity outcomes. This paper describes a five-year analysis of Baltimore homicides.

Methodology

All Uniform Crime Report data collected on Baltimore homicide deaths occurring between 1986 and 1990 were used for this study. These data from the Baltimore City Police Department include all criminal and justifiable homicides that occurred in Baltimore. The geographical areas analyzed represent the nine police districts.

Results

Risk of homicide. Homicide victimization has continued to increase since 1987. In 1986, the age-adjusted death rate from homicide was 32.5 per 100,000. From 1987 through 1990, this death rate increased from 31.6 to 32.9, 36.5, and 42.5, respectively. By race, 91.2% of homicide victims were African-American, 7.9% were white, 0.4% were Hispanic, .02% were Asian-American, and 0.1% were other.

African-Americans comprise the largest minority population in Baltimore. Hence, African-American will be the designated term used in this paper to reflect the minority or nonwhite label.

When African-American rates were compared with white rates of victimization, African-Americans were more than four times as likely to be victimized as their white counterparts (50.6 vs 11.6 per 100,000). Race and sex analyses revealed that African-American males were at the greatest risk of homicide, followed by white males, African-American females, and white females. African-American males were five times more likely, and African-American females were over two times more likely, to be homicide victims than their white counterparts. Between 1986 and 1990, the age-adjusted homicide victimization rate per 100,000 was 6.7 for white females, 17.0 for white males, 15.8 for African-American females, and 90.7 for African-American males.

Individuals between 15 and 24 years of age were at greatest risk, followed by those 25 to 34 years old. What is striking is the finding that there was a significant increase in risk for individuals between 15 and 24 years of age from 1989 to 1990. The rate jumped from 83 to 108 per 100,000 population—a clear increase in adolescent victimization.

During this five-year period, the victimization ratio between African-Americans and whites was 9:1 for those 15 to 24 years of age. For those 25 to 34 years of age, the ratio was 8:1.

Weapon. During the period 1986 through 1990, firearms were the primary weapon of choice for committing homicides. Firearms accounted for 64% of homicides, followed by cutting or piercing instruments (20%) and bludgeons (7%). Handguns accounted for 94% of all firearm-related homicides. For both African-Americans and whites, firearm assault was the primary method of homicide. The death rate for the two respective groups was 32.4 and 4.93 per 100,000.

Circumstances and location. Most homicides involved drugs or drug trafficking and occurred in city streets. Homicides involved drugs 42.4% of the time, arguments 20.9% of the time, and robbery 10.8% of the time. The primary locations for most homicides were the streets, private residences, and apartments. Shop parking, vacant residences, school playgrounds, nightclubs/taverns, and parks/playgrounds were not as predominate homicide sites.

Relationship and age of victim to assailant/arrestee. The majority of homicide victims were acquainted with their assailants. In general, male homicide victims were more likely to be killed by acquaintances, whereas females were more likely to be killed by family members. Whites were most likely to be killed by strangers (4.67 per 100,000), followed by acquaintances (3.3), family members/relatives (0.07), and lovers/spouses (0.2)

The age of homicide arrestees reflected the high homicide risk for those ages 15 to 24 and 25 to 34. The majority of homicide arrestees and homicide victims were in these age groups, with most being in the 15 to 24 age range.

Geographical locale. Over the course of this period, homicides in the nine police districts were analyzed. The highest and lowest death rates were in the western (75.4) and northeastern (14.7) police districts. Following behind the western police district were central (66.9), eastern (60.5), northwestern (37.5), southwestern (31.7), southern (29.1), southeastern (25.2), and northern (17.7).

When type of weapon was examined, firearms and cutting/piercing instruments continued to be first and second in rank order across all districts. Looking at age of victim and police district, the majority of homicides occurring among those 15 to 24 years of age occurred in the northwestern district, whereas most homicides among those 25 to 34 years of age were in the central district **(Table 1)**.

Discussion

Between 1986 and 1990, African-American males, 15 to 34 years of age, were the most likely homicide victims in Baltimore; they were eight to nine times more likely to be victimized than their white counterparts. Homicides tended to occur with the use of a handgun, in drug-related circumstances, on the streets, and during arguments with acquaintances of similar age. In Baltimore, the western police district was the locale with the greatest victimization risk.

These findings are consistent with national data from the Centers for Disease Control and Prevention Homicide Surveillance Reports.[1] In Norton and Smith's *Homicides in Baltimore*,[2] those 24 to 34 years of age were at greatest risk for

homicides. Our findings show that homicide victims are becoming younger and younger; this is consistent with national trends.[3] The finding that African-American males 15 to 24 years old had a homicide rate of 108 per 100,000 greatly exceeds the 1990 and *Year 2000 Health Objectives* for this population; the 1990 health objective was fewer than 60 homicides per 100,000.[3]

In addition to the disturbing epidemiological findings related to young African-American males, was the finding that most homicides occurred with handguns and in drug-related circumstances on the streets. The authors agree with Webster et al[4] that gun control is important in the prevention of handgun-related mortality and morbidity. This clearly, however, is not sufficient. The recent handgun thefts from gunshops in Maryland and throughout the nation speak to the need for wider ranging gun control laws. Just as clearly, however, the need for dropout prevention, increases in employment opportunities, and support for family discipline and cohesiveness cannot be ignored.

The public health field has gone beyond the traditional criminal justice and medical models of behavior and disease. Epidemiological findings of different ages at risk in different geographic areas strongly suggest the need for a variety of prevention strategies for these diverse communities. Peer-group conflict-resolution strategies may have greater impact in younger groups, whereas readily available employment opportunities, with mentoring, may be appropriate for other age groups. This study reflects the need for public health professionals in various disciplines to share information, educate the public, and implement and evaluate programs to reduce firearm-related homicides.

Maternal and child health services in the Baltimore City Health Department, 1900-1992

Grace Black, R.N., M.S.N., and Nira Bonner, M.D., M.P.H.

Ms. Black and Dr. Bonner are employed by the Baltimore City Health Department.

ABSTRACT: *Maternal and Child Health Services in the Baltimore City Health Department, founded in 1934 and 1919, respectively, grew out of concern for maternal and infant death. Increasingly, services have focused on prevention and on building individual health by strengthening the family. The authors identify changing patterns of health care and the health department's continuing role in assuring high quality care and developing guidelines for cost-effective management.*

The early Maryland settlers brought with them a strong tradition of preventive health measures which, in 1797, were translated into City Ordinance 11 (dealing with the prevention of pestilential and other diseases) and Ordinance 15 (concerned with preventive sanitary measures).[1] These ordinances laid the foundation for guarding the city's health. Local programs, however, that addressed mothers' and children's specialized needs did not come into being until the beginning of the twentieth century, paralleling the advent of national legislation pertaining to maternal and child health and welfare.

The federal government's Children's Bureau was created in 1912,[2] following a resolution of the 1909 White House Conference on Child Health—the first gathering of its kind on a national level. The bureau's initial mandate was to address infant mortality—a problem that continues to burden Baltimore women of childbearing age today. Two assumptions of this early federal bureau continue to guide Baltimore public health policy in maternal and child health. These include recognition of (1) the intricate and delicate relationship between maternal health, birth outcome, and later health status of infant and child, and (2) the role that socioeconomic factors and environmental factors have on the health of mother and child. The first federal law pertaining directly to maternal and child health, known as the Sheppard Towner Act, was passed in 1921.[2] The act targeted maternal and child health services by sex and age groupings. The landmark legislation represented the

first instance in which the US government provided direct support of health services for any of its citizens. Due to strong opposition against this early form of socialized medicine, the act was allowed to lapse, and the national maternal and child health programs ceased to function. In 1935, however, after five years of inaction, Title V of the new Social Security Act reinvigorated the federal government's role in the health and welfare of mothers and their infants. It established the public's responsibility for the well-being of all children born into this society—a responsibility still addressed today.

Although the Baltimore City Health Department placed its first school nurse in 1905, it was not until 1919, five years after the establishment of the federal bureau, that the Baltimore Bureau of Child Welfare was created.[1] Fifteen years later, the Baltimore City Health Department established the Bureau of Maternity Hygiene in 1934.[3] As a measure of its impact, it is notable that in 1900 there were 86 maternal deaths per 10,000 live births, but by 1949, this rate had decreased to 55 per 10,000 live births.[4]

The story of maternal and child health cannot be separated from that of public health nursing, which was established as a Baltimore bureau in 1920 with child health, well-baby, and maternity clinics providing primary care to families. Although the terms "family-centered health care," "case management," and "primary care provider" did not come into vogue until much later, these concepts were applied early on in the provision of maternal health care services. To this day, however, all programs—even those labeled family-centered health care—have dealt with family only in the sense of using family support to improve the health of mothers and children. The programs still do not provide health services to adults other than women of childbearing age nor attempt a holistic approach to the family as a unit. This shortcoming is manifest in the manner in which national mother and child health laws are written and administered under the collective Maternal and Child Health Block Grant.

In the early part of the century, public responsibility for maternal health was shared with obstetric departments of teaching hospitals. Home deliveries were attended by medical students from teaching hospitals, while beds for indigent patients were available at city hospitals. Maternal services reached their heyday in the 1960s and 1970s when considerable funding was made available through an innovative program called Project 501.[5]

During the 1980s, the Baltimore City Health Department provided prenatal care primarily through funding and oversight of two maternity centers: the Westside Center run by the University of Maryland Hospital, and the Eastside Center managed by the Johns Hopkins Medical Institutions. Due to a resurgence in the infant mortality rate, the health department recently re-instituted prenatal care initiatives with programs such as Healthy Start* and the Baltimore Project.

At various times during this century, the child health spotlight has fallen on different age groups (i.e., infants and preschoolers, school-age children 6–12 years of age, and adolescents). These changing emphases have been based on assorted factors, including actual health and disease trends as reflected in morbidity and mortality statistics and the development of health standards such as milk pasteurization and the enriching of flour. In addition, a growing concern for children's rights in the century's early decades, the women's movement, growth in the concept of self-determination, constraints brought about by growing health care costs, the trend toward privatization, and the strong leadership of Baltimore-based health professionals have helped shape local child health services.

Although the Baltimore City Health Department did not have a formal policy and planning division until the 1980s, thoughtful analysis has always guided policy development and application. Public health leaders have collaborated with the health department[6,7] in conducting major studies, and, more recently, department staff have directed internal studies. The health department "networked" with interested groups and agencies long before the word was invented. The network included the Medical and Chirurgical Faculty of Maryland (Med Chi), the University of Maryland, the Johns Hopkins University, the Baltimore Department of Education, local physicians, the Baltimore Department of Recreation and Parks, and various anti-poverty programs and agencies such as Head Start, Model Cities (later called Urban Services), and the Job Corps.

Basic services for children, regardless of age, have always included physical examinations with state-of-the-art developmental evaluations, referral for problems, and parent counseling, whether called anticipatory guidance or health education. The tools of child health could always be contained in a nurse's bag, the ubiquitous ice bucket or cooler, and assorted cartons stashed in a nurse's vehicle, whether it was a Model T, a Volkswagen, or the motor scooter used by one nurse in the 1960s.

Integral parts of child health services include lead paint poisoning prevention and treatment, handicapped children services, vision and hearing testing, identifying and arranging for services for learning disabled children, nutrition, and social services.

The services that varied the most over time were those for adolescents. Until 1959, services for students in secondary schools were provided by the Baltimore Department of Education. At that time, school nurses "came over" to the health

**Editor's note: Med Chi will be spearheading the infant mortality review for the Healthy Start Project. In addition, a multidisciplinary group will be formed under Med Chi auspices to make recommendations to improve services directly to the Healthy Start Program, formulate recommendations to the Governor's Commission on Infant Mortality, and to possibly make recommendations for legislative changes.*

department. Physicians were the dominant provider for adolescent health services. As might be expected, many health problems were identified but were not aggressively followed up. In those days, it was believed that adolescents were the healthiest segment of the population. Not until after the Harlem Study of Adolescent Health did physicians and others take a closer look at data and realize the health department should take a more active role in adolescent health. Adolescents were, subsequently, included in comprehensive child health services and family planning services, and attention was given to their special needs in maternal health. Again, adolescent experts in the teaching hospitals provided valuable help in health department programs development. During the 1960s, teen pregnancy began to be seen as a health risk rather than a moral problem identified by calling a pregnant teen an "unwed mother." Today, many programs address adolescent health, recognizing that the teen is a child still in the process of becoming an adult, while at the same time facing adult responsibilities. It is hoped that these programs can be continued and enhanced as the health department determines what is the best use of resources. Effective programs for teens have a direct impact on two generations.

Another area identified closely with child health is immunization. Med Chi provided the first inoculations for yellow fever, cholera, and smallpox at the almshouse starting in 1801 or 1802.[1] The health department began giving smallpox vaccinations about 1824. When the health department began its child health clinics, immunizations became an integral part of the health supervision. Some innovative ways of getting the community vaccinated were "Salk Sundays," which were held when Salk polio vaccine first became available. A nurse-sanitarian team would go door-to-door with the Sabin oral polio vaccine, knocking on doors and asking if the families had any uninoculated children. The sanitarian followed, carrying the cooler of vaccine and a bull horn, announcing free vaccine.[8] Other campaigns included the "Rub Ella Out" school campaigns against rubella, the "Measles Saturdays," the mobile van that traveled into neighborhoods, the immunization clinics run by the school health department, the city-wide "Shots for Tots" campaign to celebrate the world summit on children in 1990, and the massive 1992 health campaign mounted by the National Guard with the help of community health nurses. In many clinics, these services are no longer free, nor are they covered services under some employee health plans.

Current status in maternal and child health services

During the past three years, the health department has held a number of forums to develop strategic plans for defining and implementing the department's role in primary care. Some conclusions reached include:

- Prevention is fundamental to public health. Early intervention is a subcomponent of prevention and not easily distinguishable as both involve similar techniques and approaches. Primary care is largely a preventive and interceptive activity based on physician–patient medical models.
- In the context of maternal and child health, prevention means providing primary care for pregnant women (i.e., prenatal care and outreach for those at particular risk)—early intervention. Once the child is born, primary care (comprehensive pediatric care) is essentially early intervention—outreach to families with infants at risk. The Baltimore City Health Department's priority for children and its objectives for reducing infant mortality rates, lead toxicity, and teen pregnancy are consistent with traditional health departments roles.
- The health department must continue its traditional role of protecting the community's health through a combination of prevention, early intervention, and primary care procedures, activities, and programs.
- The health department should demonstrate effective programs, develop guidelines for cost-effectiveness and quality management, and monitor Maternal Child Health Block Grant programs. It should continue direct delivery of program services where mandated and where no other resources are adequately available.
- Defining the health department's role in providing family health services is a very significant issue that continues to surface in planning forums. The health department has enlarged its mission to include the integration of services applicable to a family unit and re-aligned services to validate the family's central role in a child's life, including the strengths and needs of fathers. It is vitally important, however, to keep a distinct unit responsible for mothers and children. The close links between services for mother and child must remain intact for continuity of care and other measures of quality assurance.

So many faces and pictures come to mind as the authors try to describe "how it was" in maternal and child health in the early years. One author's experience spans almost half the life of child health services in the Baltimore City Health Department. The other author became involved more recently, but has participated in most major changes in recent years, wielding a scalpel with one hand to fix or prune existing programs, while nurturing new growth with the other hand.

- What will the next 50 years of maternal and child health services be like?
- Will traditional patterns of care be followed?
- Will policy making and program implementation ever be integrated? Will prevention ever be made a major focus, saving health costs and human misery?

- Will the family be viewed as a unit and vehicle for building healthy members?
- Will ways of collecting data be standardized to more accurately reflect needs and progress in meeting those needs?

Perhaps some young professional reading this article will be around to write an update of the maternal and child health services story in 2043.

Two Reasons Why You Should Refer Your Patients To Accessible MRI:

1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.

We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

Book Reviews

Living with Rheumatoid Arthritis. Tammi L. Shlotzhauer and James L. McGuire. Baltimore: The Johns Hopkins University Press. 1993. 216 pages. $22.95

About three million Americans—many in the 20–40 year age range—suffer with rheumatoid arthritis (RA), and, this year, 200,000 more will join the ranks. If all concerned cooperate in their care, they may live full, satisfying, and highly productive lives. Knowledge of RA provides the power to cope with and answer the problems that will be encountered.

Living with Rheumatoid Arthritis presents a thorough discussion of the articular and extra-articular symptoms. In addition, valuable portions of the book are concerned with exercises for various joints that may be involved and with medication advice. Rheumatologists now believe that the more powerful medications should be used early in the course of the disease before irreversible joint damage is present. Aspirin and nonsteroidal anti-inflammatory drugs are now being offered less frequently as the first-line approach.

The disease-modifying anti-rheumatic compounds (injectable gold, oral gold, hydroxychloroquine, penicillamine, and sulfasalazine) alter the course of RA by controlling arthritis and preventing joint damage. Although these drugs do not provide fast pain relief, improved comfort is often a long-term benefit. Special attention is given to the immunosuppressants, which include methotrexate, azathioprine, and cyclophosphamide. The side effects of these potent drugs are reviewed carefully.

When medications resembling natural cortisone are taken in larger amounts than the body normally produces, a marked decrease in the inflammatory process is observed. Frequency of the numerous side effects seen in steroid treatment of RA is related to dose size, treatment length, and nature of the individual patient. Cortisone injection into an involved joint is efficacious and usually well tolerated.

The most important part of the therapy advice is contained in a section called "Coping Strategies." Patients encounter physical and mental changes in the course of RA, and a strategy to meet these challenges is all important. A satisfactory life by the individual with RA may be attained by assessing the difficulties engendered by it and then modifying behavior in concordance with available resources. Continuing reassessment is necessary to attain realistic goals and a more pleasant life. Although the doctor, medications, and relatives may help considerably, the therapeutic goal will not be achieved without the patient's thoughtful and enthusiastic cooperation.

Surgery for arthritic joints is an option recommended for a variety of reasons. The most common is to control severe pain caused by inflammation or damaged joints.

Rheumatologists will be familiar with the material in this RA review. They should read it, however, as they might wish to recommend the book to their patients and patients' relatives. The message that one has a chronic disease may be depressing, but these emotions may be alleviated or ablated by the therapeutic counterattack mounted by the patient. Knowing what to do and then doing it may be the first steps toward at least a partial recovery and a happier life.

Shlotzhauer and McGuire have given patients with RA a *vade mecum* about this disease. Because the nuances of RA must be understood by the patient and the relatives to permit optimal management of the disorder, the book is particularly valuable.

Homicide: A Year on the Killing Streets. David Simon. New York: Fawcett-Columbine. 1991. 594 pages. $24.45

Most book reviews in the *Maryland Medical Journal* deal with manuscripts describing medical disease, various aspects of health care delivery, or "guiding lights" in the medical profession. This month's *MMJ* contains a sobering report of homicide as a public health problem in Baltimore during the years 1986–1990 (see Wood et al, page 771). For readers of this public health report who want to delve further into this aspect of sociological deviation, David Simon's book, *Homicide: A Year on the Killing Streets*, is both an informative and fascinating read.

Homicide is Mr. Simon's description of his year as a police intern. He followed investigations by members of the Baltimore Police Department Homicide Unit as they pulled together the jigsaw puzzle of a year's worth of murders in Maryland's largest city.

The book's primary subject is both depressing and sobering, and it closely mirrors the Baltimore City Health Department's description of this violent crime. Many of the crimes described center around drug use and drug dealing, and the amount of sympathy elicited for the victims by the investigating detectives is not extreme. In subsequent investigations, the frequent lack of cooperation by residents in neighborhoods where these violent crimes are being committed bespeaks to the apathy and despair existing in many inner city Baltimore environs. It is also a vivid demonstration that available social institutions and educational opportunities have not provided many young African-American males with the skills necessary to earn a livelihood other than from drug dealing.

Simon's book points out that "all murders are not equal." The term "redball" is used to describe the murder of someone uninvolved in any criminal activity. Several murders involving children were particularly difficult to handle, both for the community and the investigating detectives. A near fatal shooting of a police officer aroused strong emotions of revenge in the whole unit. A fatal shooting, apparently by a police officer, became an ambivalent experience for the primary investigating homicide detective. Simon's description of the "Black Widow of Baltimore" who took out life insurance policies on multiple husbands and various relatives, and then hired addicts and thugs to kill the insureds so she could collect insurance proceeds, was almost humorous.

As physicians, we have dedicated our time and energies to saving lives and alleviating pain and suffering. It is hard to imagine that anyone, no matter how desperate, could so casually and callously end the life of a fellow human as is described repeatedly in this book. Simon's work is a poignant reminder of the feeling of futility that has pervaded many inner city areas in the United States. It also fosters a deep appreciation for the sanctity of life and a realization that new social initiatives and economic incentives that effectively combat inner city problems are well worth the sacrifices needed to accomplish them.

Blue Cross and Blue Shield of Maryland derivative litigation

The Med Chi Council voted on July 15, 1993, to approve involvement of the Faculty as *amicus curiae* in the following action. A group of physicians and policyholders of Blue Cross and Blue Shield of Maryland, Inc., including Charles F. O'Donnell, M.D.; John C. Ahlberg; Kenneth R. Glauber; Paul A. Mullan, M.D.; Dana Whitehead; and Donald G. Light, has brought a policyholder's derivative action on behalf of Blue Cross and Blue Shield of Maryland (BCBSM) against certain present and former officers and directors of BCBSM for negligence and breach of fiduciary duties in the management of the corporation, as disclosed in hearings before the United States Senate in 1992. The individual defendants include the following: Carl J. Sardegna; William Beasman, Jr.; Barry Bosworth; J. Owen Cole; Dan A. Colussy; M. Thomas Goedeke, E.D.; Frank A. Gunther, Jr.; John J. Jeffries; Albin O. Kuhn; Fred M. Gloth, Jr.; Charles E. Vadakin; Phillip H. Grantham; Stephen E. Bailey; Peter J. Kampisi; and Hadley C. Ford and Booz-Allen and Hamilton, Inc., an accounting firm.

The attorneys for the policyholders in this action approached Angus R. Everton, Med Chi general counsel, with the request that Med Chi lend its name and *some* legal services to the plaintiffs in the capacity of *amicus curiae*. In this capacity, Med Chi could assist in the preparation of briefs and legal memoranda, and would be listed as *amicus curiae* on behalf of the plaintiffs on pleadings, but would not be directly involved in the trial of the case or in any oral arguments on appeal. An *amicus curiae* is "friend of the court" and enters into litigation because of an interest on its part in the outcome, on one side or the other.

The reasons for becoming involved in this litigation as *amicus curiae* are as follows: The lawsuit is analogous to a stockholder's derivative action, brought on behalf of BCBSM, to recover substantial sums of money that were allegedly dissipated by the corporation through the acts of the various defendants, including the accounting firm. This is lost money that had to be made up out of the pockets of policyholders and treating physicians, and, if it is recovered, the ultimate effect will be diminished premiums to policyholders and, quite possibly, more reasonable payments to all health care practitioners who provide services compensated by BCBSM. Obviously, if in fact the allegations in the complaint are true, and if these officers, directors and the accounting firm, through their conduct, caused this sort of monetary injury to BCBSM, the funds lost should be recovered. It was thought by the Executive Committee and, ultimately, the Council that it was clearly in the interests of the Med Chi membership to see that BCBSM is financially sound, and this lawsuit was perceived as one means by which some degree of financial soundness could be restored to the Blues.

Council's decision has been conveyed to Messrs. Nolan and Brassel, attorneys for the plaintiffs. Any questions regarding Med Chi's future involvement may be directed to Angus R. Everton, Esq., Med Chi general counsel.

ANGUS EVERTON, ESQ.
Med Chi's general counsel. ■

Forty years ago

Forty years is a fascinating interval. It can be seen as a generation—four decades of change and advancement: new medications, new diagnostic tools, and new techniques and procedures.

On the other hand, human nature may not have changed very much. *Plus ça change, plus c'est la même chose.*

Excerpts from the past are selected to remind us of our limitations. Some limitations of the past may seem silly in today's scientific light, but others may point out the ignorance of today and the need to mush on with some humility.

1953:
The Korean armistice was signed in July.
The St. Louis Browns moved east and became the Baltimore Orioles.
Queen Elizabeth was crowned.

Below is material from February 1953. A monthly report by the executive director of the insurer followed by a thoughtful article by a Med Chi member. If the insurance business and Med Chi had paid closer attention to some comments from Wicomico County, "progress" might have been more cautious and the parachutes less golden.

JOHN W. BUCKLEY, M.D.

The employer and Blue Cross–Blue Shield

Reprinted from the *Maryland State Medical Journal* 1953; 2(1): 101–3.

The Blue Cross–Blue Shield subscriber who utilizes his membership to cover the expenses of his hospital and medical care quite naturally feels grateful to the doctors and hospitals who guide him toward better health. He is grateful to Blue Cross–Blue Shield for taking care of all or part of the bills. He may even be aware of the fact that there is a close relationship between those members of the team that helped him; that Maryland Hospital Service and Maryland Medical Service are, in effect, the agents of the hospitals and the doctors in bringing him the best treatment at a cost he can afford.

But there is another important figure in the background of the picture. It is the businessman: the employer whose cooperation made it possible for the working man to enjoy the benefits of the Plans.

The employer contributed a great deal more to the success of Blue Cross—Blue Shield than his permission to allow membership solicitation to be made on the job and to set up the simple system of payroll deduction of subscription charges

on a group basis. The entire group principle is based on willingness to work with other members of the community health team. Blue Cross and Blue Shield benefits and rates are predicated upon the group principle, namely, that an average selection of risk is obtained which, in turn, means low subscription rates. No health statement is needed, such as would be required if memberships were sold to individuals.

That our very existence is contingent upon the employer's cooperation and sponsorship, we all know, but he benefits himself in many ways from Blue Cross and Blue Shield. He derives satisfaction from knowing that his employees are protected against hospital and medical bills. He recognizes that such protection gives the employee more peace of mind and less worry about his personal finances. He knows that it increases the respect of the employee for the company that makes his welfare a part of its personnel policies. He has learned that absenteeism due to illness and poor production on the job are lessened when the employees know that they can afford hospital and medical care at the first symptoms of sickness. In the long run, he finds that it pays in both good will and good business operation to encourage enrollment of his people in a Blue Cross-Blue Shield group. And, finally, looking beyond the doors of his own firm, he sees that he is contributing to the general welfare and good health of people in his community.

R.H. DABNEY

R.H. Dabney was executive director, Maryland Hospital Service, Inc., Maryland Medical Service, Inc.

Blue Cross, Blue Shield; "Indemnity" or "Service"

The voluntary hospital is an ever more efficient agent and has come a long way in the last 100 years. Originally conceived as a concentration point for the bedside care of hopeless invalids, few of whom expected to, or did, become rehabilitated; the converse is now so generally true that few expect otherwise.

Although the procedures that the physicians carry out and the medicines and biologicals they use have changed radically; the main services which the hospital renders are basically unchanged viz., housekeeping and nursing care for the sick patient, on the one hand; technical aid to the physician, in his diagnostic or therapeutic efforts, on the other.

The professional nurse is an important part of this complex and her intelligent dispatch of the systems of treatment, outlined by the physicians in charge, determines greatly the nature of the result.

The voluntary hospital was, from the beginning, a charitable and cooperative community answer to the problems of the sick patient; where the facilities could be maintained for all and a nominal charge be made to the users; except the poor. The more fortunate gave freely. The poor, in the real sense, have all but disappeared. Although many are most comfortable, few are sufficiently secure and substantial to consider themselves in the roles of personal philanthropists. The base had to be "broadened," but the hospital patient resisted, and rightly, to becoming the sole support of the hospital. The Blue Cross Plan was a splendid solution—a form of voluntary taxation, mutually levied on the potential users, in groups. The plan solved a difficult situation; but left much to be desired. The public which could prior scarce afford C.O.D. services, and seldom made provisions against the possibilities; now began to gather momentum as Pre-Paid Consumers.

The Pre-Paid Consumer begins his cycle with the natural relaxation of peace and protection; but he has repeatedly demonstrated his ability to develop a healthy, if not a voracious, appetite for things to which he is "entitled." Hospitalization; and its more expensive accessory goods, and services have proven no exception. This has become the kernel of every conference and meeting that is concerned with patient costs; and to postulate that the physicians have effective control and could limit the consumption of these goods and services is sheer fantasy, if not worse!

The lowered mortality and morbidity; and the generally pleasant air in hospitals today, has removed virtually all the deterrents that faced the potential patient; the last barrier is gone, or was, when full pre-payment appeared. To ask the physician to deny the subscriber his use of the Plan is asking him to correct an inherent fault too great; and a fault many physicians foresaw from the inception. The prohibitive cost of automobile collision insurance, except when on a deductible

basis, suggests an approach toward an answer to this Pre-Paid Consumer whose appetite will one day exhaust the reserves; in short, nullify the purposes of the entire plan.

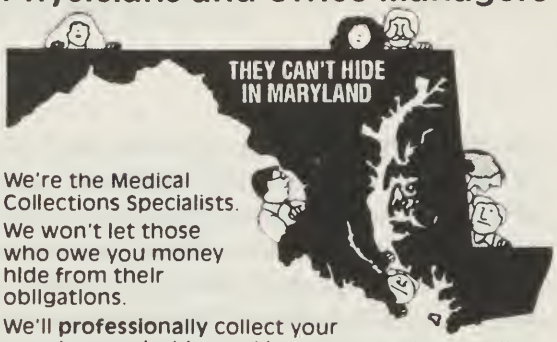
So much for the community's cooperative attempt, to find a satisfactory answer to the inadequate home sick-room; and which has evolved the modern voluntary hospital in America, a monument to devotion and service. The Blue Cross is an excellent attempt toward equitable finance, in the field of hospitalization, but some of its features have far reaching aspects deserving close and careful consideration.

The professional doctor and professional nurse are only by association part of the hospital; and in a sense the nurse is the liaison between doctor and hospital; all three rendering a distinct indispensable service to the patient. The gradual merger of the vision of nurse and hospital has progressed to the point where the nurse, as an individual of professional ability is almost unnoticeable. This is to be deplored. The nurse should be a team member; cooperative but *professional.*

The nurse can hardly recall that her counterpart of a century ago once worked almost solely in patient's homes. Not so the physician; his activities in the hospital have only recently become a major, albeit always important, part of the many functions of his profession. He has adapted himself and his patients to the hospital and it to him. He depends on the hospital, from a practical standpoint, but not fundamentally.

As to his services to the patient, they resist definition; and this is the key to a profession. The amount, type, scope and value of those services vary in an infinite number of ways and these are subject to change without notice; according to the giver and the receiver, and countless other factors. The custom of paying a fee for a professional service has long been justly honored as a solution; and no other profession can point to a more honorable record, of service to the needy save, perhaps, the clergy.

We are threatened by some politicians with *Federal* standardization of professional services for medicine; and wooed by well-meaning friends and associates to join voluntarily in a Blue Shield Plan, whose aims and principles differ only in degree. This seems harsh but it is, at least, honest. The means of finance may belong to financiers and planners, but the agreement on the nature of the services, and the fees to be paid, in any given instance, is a matter to be settled between the parties involved—and this is a fundamental to a profession.



This author is concerned with but one issue; it lies between "Indemnity" and "Service" as the basis for payment of prepaid medical insurance. The indemnity method protects the above defined fundamental and, in no way that is apparent, injures the policy holder. He can readily find treatment at the Service fee levels, *if* these are realistic; all factors being considered, including the momentary economic indices, both general and personal. What sufficient purpose, then, exists, for the profession to catalogue its services and offer at predetermined fixed fees? Let us not lose touch with the people. The arrival at an equitable fee must be a cherished privilege and recognized as a responsibility and a trust, of no less importance than the several other great keystones underlying the relationship between patient and physician. The "Indemnity" feature has desirable elasticity and will limit the endless pressures, conferences and debates, through which one group, and then another, will attempt to alter the details of payment, premiums and eligibility in a fixed-fee service plan.

Let us resist the continuation and expansion of the types of plans which catalogue fees exactly, and provide full prepayment to the consumer. Inflexible to the physicians, taxing the thrifty user in favor of the less scrupulous—the so-called "Service" plans are a long step towards reducing the status of the profession, eliminating the physician as a free agent; and nullifying the value of money as a mode of exchange and a method of saving for future use, the fruits of one's present or past endeavors. Thus, both the subscriber and the physician are injured. The steadily climbing premium costs are mute testimony, and these are but a preview; for the plan administrators cannot forever expect the luxury of claims even as low as now! How long will the private patient continue to build and furnish the hospitals while the Blue Cross patient enjoys a maintenance cost basis? How long will it take us to realize that these are not a few of our patients, but soon will be almost all?

Let us leave no stone unturned in a search for insurance against *catastrophe*, either sudden or chronic. This is the insurance every honest citizen wants. Let us, however, stand as a bulwark against signing the public and the profession to a contract which tends to standardize professional fees; must eventually lead to endless bickering between the representatives of the policyholders, hospitals, and professional groups—each anxious to obtain equity; whilst uncontrollable wastefulness makes a mockery of the entire proceedings!!

Highlights: Executive Committee and Council Actions

Executive Committee meeting, July 12, 1993

Actions taken

1. Positions, not candidates, will be supported by Med Chi, with candidate support referred to MMPAC (Maryland Medical Political Action Committee).

2. It was noted that candidates may buy a booth at the semiannual meeting to promote their candidacy and that nothing in Med Chi's bylaws prohibits this action—a candidate buying a booth is not a form of endorsement but free enterprise.

3. The Maryland Alliance for Health Care asked Med Chi to provide $5,000 to help with start-up costs for the Community Health Management Information System (CHMIS), which will be operated by the Maryland Foundation for Quality Healthcare (Foundation). The Executive Committee was concerned about membership on the Foundation's board of directors and asked Med Chi's chief executive officer (CEO) and Donald H. Dembo, M.D., president-elect and member of the Maryland Alliance for Health Care, to request that the Foundation's bylaws be amended to reflect that Med Chi provide more physicians to the board than previously noted. The Executive Committee asked that this revision be finalized by July 15 so the Council could vote on the funding request.

4. The Ad Hoc Legislative Enhancement Committee conducted interviews with prospective Med Chi lobbyists. Med Chi's CEO was requested to meet with the four identified candidates and report back to the Executive Committee. The CEO, chief operating officer (COO), and general counsel will report back to the Executive Committee regarding fiscal and operational aspects concerning the lobbyist.

5. Since the Baltimore County amendments to HB 1359 were received after the suspense date, Baltimore County will be notified that its amendments will be properly reviewed and presented to the Executive Committee and House of Delegates in September.

Council meeting, July 15, 1993

1. The Council chairperson reviewed the Council's charges.

2. The Council chairperson stated he would like Med Chi's bylaws to be more coherent and reflective of current Med Chi policy. He noted that the Bylaws Committee, under the chairpersonship of J. Ramsay Farah, M.D., is actively pursuing this.

3. Emeritus membership was granted to Claude L. Bell Jr., M.D. (Anne Arundel), Claudia B. Blair, M.D. (Harford County), Louis W. Doroshow, M.D. (Baltimore County), and Harold Sussman, M.D. (Baltimore City).

4. The recommendation of the Committee on Managed Care and Third-Party Liaison was referred to the Executive Committee for a decision. The committee recommended employing a marketing research firm, selected through competitive bidding, to put together a physician survey to evaluate HMOs (health maintenance organizations), PPOs (preferred provider organizations), managed care companies, and other insurance companies and payers doing business within Maryland. The survey would rank the entities on the basis of general and specific criteria in order of efficiency and effectiveness for Maryland patients.

5. The Maryland Alliance for Health Care asked for $5,000 to fund start-up costs for the Community Health Management Information System (CHMIS). The Council approved the start-up money.

6. The Public Health Committee recommended that Med Chi support the efforts of the Maryland Alliance Against Family Violence and provide $25,000 to be disbursed over a two-year period. Efforts would target physician education and legislation that would be friendlier to physicians who report family violence. The recommendation was approved, and the funding request was referred to the Charitable Education Fund and the Finance Committee.

7. Council approved the Committee on Scientific Activity's recommendations to revise its mission statement and to hold the 1994 annual meeting in Hagerstown on May 12-14, 1994.

8. Med Chi general counsel was instructed to cancel the InforMed contract.

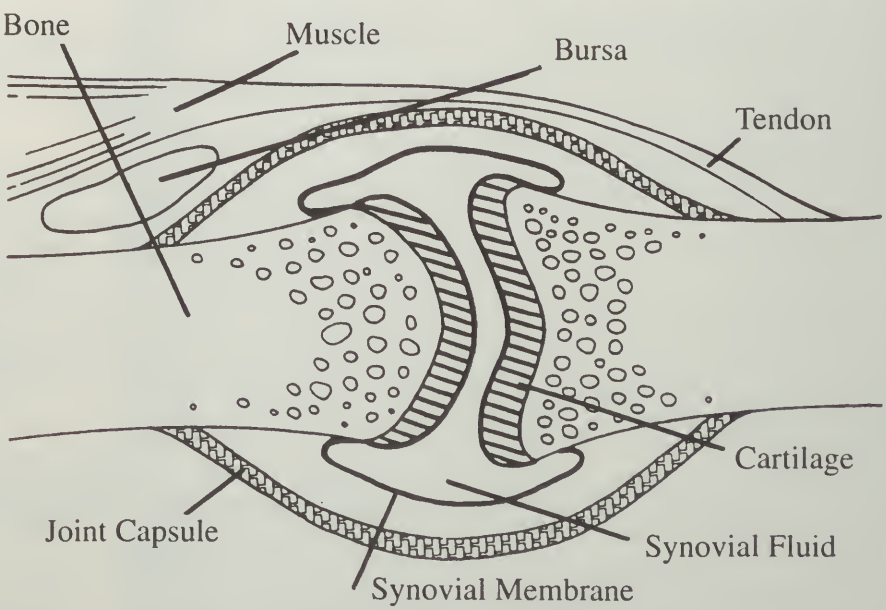
9. Med Chi general counsel was instructed to join the *amicus curiae* brief filed by Blue Cross and Blue Shield of Maryland (BCBSM) participants against BCBSM Board of Directors members and officers to recover BCBSM monies.

10. The Public Relations Committee presented two recommendations to Council:

    a. Component societies should be requested to refrain from advertising [e.g., including component society identification on public service announcements] when individual physicians are being promoted. This recommendation was referred back to the Public Relations Committee.

    b. The feasibility of enhancing the public image of physicians through a major professional public information campaign directed to the public, physicians, and legislators be considered. This recommendation was approved.

11. The Ad Hoc Legislative Enhancement Committee noted that it had interviewed eight lobbyist candidates, and, that at the Executive Committee's direction, the CEO was interviewing the finalists in relation to specific issues. This information is to be brought back to the Executive Committee as soon as it is gathered.



12. Alex Azar, M.D., was elected to complete the unexpired AMA delegate term of Donald "Ted" Lewers, M.D. Carol W. Garvey, M.D., was elected to fill the unexpired AMA alternate delegate term of Dr. Azar.

13. A motion was made by Montgomery County that the Council chairperson appoint an ad hoc committee composed of one Council representative from each Nominating Committee group to organize a retreat to examine Med Chi's structure and operation to determine if they are adequate to meet the needs of physicians and the public in the coming decade. The motion was seconded and passed. The Council chairperson will select an ad hoc committee and charge the committee to report back at the September Council meeting. ■

Call for Papers

1994 International Conference on Physician Health
September 14-18, 1994. Ottawa, Ontario, Canada

"Stress: The Profession, the Family and You"

The 1994 International Conference on Physician Health, co-sponsored by the American Medical Association, the Federation of State Medical Boards, the Canadian Medical Association, and the Federation of Medical Licensing Authorities of Canada is scheduled for September 14-18, 1994, at the Ottawa Westin Hotel.

Ottawa is Canada's capital and offers many national museums, over 60 miles of bicycle paths, hiking in Gateneau park, squash courts and swimming at the hotel and golf nearby.

The conference will provide a forum for practitioners and researchers to present recent findings and innovative treatment and education programs in physician health. This conference will address a range of issues, such as AIDS, HIV, problems related to aging, mental illness, substance abuse and physical disabilities and limitations, including those caused by general medical conditions. Possible topics for presentation include: presentation and treatment of health problems among physicians, the impact of disorders on physicians' families and practices, medical-legal issues facing hospital administrations and licensing boards, and material on health promotion and disease prevention. *Abstracts which address issues related to these topics (i.e., prevention, diagnosis, treatment, rehabilitation), but not dealing specifically with physicians are also welcome.*

Three types of presentations regarding these physician health issues are invited:

- **Poster Presentations**
  Written presentations of data-based research, epidemiological research, or program descriptions.
- **Paper Sessions**
  Oral presentation of scientific, data-based findings relative to the topic of physician health.

  Abstracts for poster presentations and paper sessions should contain an introductory statement on the significance of subject matter. Description of methods, results, and conclusions should follow the introductory statement.
- **Workshops**
  Training or instructional presentations, designed to improve specific skills of persons who work in the area of physician health.

  Abstracts for workshops should contain information on the program's intended audience, goals, teaching strategies, and materials. Evaluation data should be summarized

Abstracts may not exceed 200 words. Any abstracts exceeding that length will be rejected. Abstracts should be typed, double spaced, and mailed (not faxed). Four copies of the abstract should be sent, along with one self-addressed, stamped envelope. All submissions must list the primary and secondary authors and their professional affiliations. Telephone number and address of primary author must also be included.

Submissions *must* be received by February 1, 1994.

Abstracts will be submitted for blind review. Abstracts will be judged on their applicability to the conference topic area and their scientific merit. The decisions of the blind reviewers will be communicated to the abstract's primary author by April 1, 1994.

All presenters are expected to register for the conference at the AMA member rate. We are unable to provide any financial support for presenters. Presenters will also be responsible for their own transportation and hotel expenses, as well as making all reservations for same.

Send all materials to:
Elaine M. Tejcek, Physicians Health Foundation, American Medical Association, 515 N. State Street, Chicago, IL 60610.

In Memoriam

John Bordley, M.D.

JOHN BORDLEY, M.D., an otolaryngologist, died July 12, 1993, at the age of 90 following a heart attack at his Baltimore home. Dr. Bordley headed the Johns Hopkins Department of Otolaryngology for 15 years until his retirement in 1969. A graduate of Yale University and the Johns Hopkins School of Medicine, he served an internship and residency at Union Memorial Hospital before completing his residency at Hopkins. A lieutenant colonel during World War II, Dr. Bordley was assigned to the 118th General Hospital. He also held visiting teaching posts at hospitals in 10 foreign countries. Named Andelot Professor Emeritus of Otolaryngology and Otology at Hopkins in 1969, he also served as professor of environmental medicine in the Division of Audiology and Speech in the Johns Hopkins School of Hygiene and Public Health. In 1969, he was named vice-chairperson and executive director of the American Council of Otolaryngology. A consultant in the establishment of the Boys Town National Institute for Communicative Disorders in Children, Dr. Bordley received the Boys Town Outstanding Citizen Award in 1982. In 1981, he received a US presidential citation, the American Otological Society's Award of Merit, and the International Federation of Otorhinolaryngology's Gold Medal. Honorary president of the VIII World Congress of Otolaryngology in 1985, he had also chaired the Society for Crippled Children's medical advisory committee, was a member of the Institute for Sensory and Brain Research, and had served on the President's Committee for Employment of the Handicapped. The John E. Bordley Chair in Otolaryngology was established at Hopkins in 1990.

Henry F. Graff, M.D.

HENRY F. GRAFF, M.D., an ophthalmologist from Hagerstown, died April 14, 1993. Born in West Virginia, he graduated from Marietta College in Ohio and the University of Michigan Medical School in Ann Arbor. He practiced ophthalmology in Baltimore for 20 years before entering practice with his brother in Hagerstown in 1948. Dr. Graff was state supervising ophthalmologist in the Public Assistance to the Needy Blind Program from 1937 until he retired in 1964. A diplomate of the American Board of Ophthalmology, he was also a member of the American Medical Association. Dr. Graff was a former associate and assistant professor of ophthalmology at the University of Maryland and chief of the Ophthalmological Clinic. A clinical assistant at the Wilmer Ophthalmic Clinic for 10 years, he was a member of St. John's Episcopal Church and a former member of the Kiwanis Club of Baltimore and of Hagerstown.

George Groleau, M.D.

GEORGE GROLEAU, M.D., a general practitioner from Howard County, died May 31, 1993, following a heart attack at his Sykesville home. Dr. Groleau, a native of Rochester, Pennsylvania, practiced in Elkridge from 1949 until he retired in 1991. A member of the Elkridge Rotary Club, Westminster Lodge of the Moose, and St. Paul's United Methodist Church in Sykesville, he received his professional education at Washington and Jefferson College in Washington, Pennsylvania, and the Temple University School of Medicine in Philadelphia. Dr. Groleau, who served in the US Army Medical Corps during World War II, was 71.

Albert I. Mendeloff, M.D.

ALBERT I. MENDELOFF, M.D., a gastroenterologist, died March 15, 1993, of leukemia at the age of 75. Dr. Mendeloff had been physician-in-chief at Sinai Hospital from 1955 to 1980—Sinai's first physician-in-chief. A classicist, with intellectual pursuits that extended to art, music, and the humanities (he read Latin and Greek), Dr. Mendeloff had an international reputation in epidemiologic gastroenterology. President of the Shriver Hall Concert Series for 12 years, he was also full professor of medicine at Johns Hopkins. He created the biochemistry research laboratory at Sinai in 1958. When he retired at age 68, he served as a senior consultant at the Loch Raven Veterans Administration Hospital, and was editor of the *American Journal of Clinical Nutrition* for 10 years. In 1990, Dr. Mendeloff became the first recipient of Sinai Hospital's Department of Medicine's Distinguished Physician Award.

Harry A. Miller, M.D.

HARRY A. MILLER, M.D., a retired diagnostic and therapeutic radiologist, died July 17, 1993, of hydrocephalus. A native of Baltimore, Dr. Miller graduated from the Johns Hopkins University and the medical school of what is now Case Western Reserve University in Cleveland, Ohio. He completed an internship at the Walter Reed Army Medical Center and a residency at Montefiore Hospital in New York City. He was also a fellow at the Curie Institute in Paris. Dr. Miller entered private practice in 1935 and was on the staff of Mercy Medical Center and Sinai Hospital. He served as a consultant to the Fort Howard Veterans Hospital. As a lieutenant colonel in the

US Army Medical Corps during World War II, he was radiologist-in-chief at army hospitals in the United States and England. Dr. Miller, who was 87, retired 15 years ago.

Norman Oliver, M.D.

NORMAN OLIVER, M.D., an orthopaedic surgeon, died July 21, 1993, at Easton Memorial Hospital from complications of a stroke. Born in New York, Dr. Oliver graduated from Long Island University and Long Island College of Medicine. He completed his medical internship and residency at Morrisania Hospital in New York. Dr. Oliver was chief surgeon at a South Pacific evacuation hospital during World War II. After the war, he practiced at Fort Howard and Children's hospitals in Baltimore before opening a private practice in Silver Spring. He served on the staff of Holy Cross, Suburban, and Washington Adventist hospitals. A diplomate of the Pan American Medical Society and a member of the American Academy of Orthopaedic Surgery and the American Medical Association, Dr. Oliver retired in 1985 and moved to St. Michaels, Maryland. He was 81.

Martin E. Strobel, M.D.

MARTIN E. STROBEL, M.D., who was 74, died July 14, 1993, from heart failure. A general practitioner in Reisterstown from 1948 until his retirement in 1981, he was a graduate of Gettysburg College in Pennsylvania and the University of Maryland School of Medicine. Raised in Frederick, Dr. Strobel performed an internship at University Hospital and a residency at Maryland General Hospital before serving in the US Army during World War II. Dr. Strobel was former president of the Baltimore City Medical Society, the Maryland Orchid Society, and the Reisterstown Kiwanis Club. He moved to South Carolina in 1985.

The experience of a nationwide laboratory.

Wouldn't it be great if you could enjoy all the advantages of a nationally—accredited testing laboratory—right here in your own neighborhood? Well, now you can.

- The nation's largest full-service clinical laboratory network
- Over 25 years experience in laboratory toxicology
- Accredited by the College of American Pathologists (CAP)
- Licensed by the U.S. Department of Health and Human Services
- Local courier network works on your schedule around the clock
- 24-hour turnaround time on most routine tests
- Extensive internal quality control program ensures the accuracy you need to prescribe proper treatment for your patients
- A commitment to serve and serve well

Clinton accepts AMA invitation to study Hawaiian health system

Hillary Rodham Clinton saw many key AMA system reform elements in action during her trip to Hawaii.

The first lady, accepting an AMA invitation, participated in a July 13 round table discussion on Hawaii's health care system, which is considered the "best working example" of system reform.

The AMA, Hawaiian Dept. of Health and Hawaii Medical Assn. coordinated the meeting with Hillary Clinton.

She took the opportunity to speak to about 30 Hawaiian physicians. Mrs. Clinton learned firsthand how state industry and government are working together in the free market to provide quality care to all its citizens, while keeping costs down.

During a June 30 speech in San Francisco, AMA Executive Vice President James S. Todd, MD, encouraged the Clintons to take a look at Hawaii's health care system -- a working example of the AMA's reform blueprint, Health Access America.

"To see our proposal at work, all one has to do is look at Hawaii, where key elements of the AMA's proposal have been at work for several years with a great deal of success," Dr. Todd said. "The Hawaii plan is real, it's working, and it's doing what the AMA and everyone on the mainland wants to do—help our patients."

After attending the economic summit in Tokyo, the president and first lady vacationed in Hawaii before returning to the White House.

Responding to Dr. Todd's speech, White House officials contacted the AMA to accept its invitation for the first lady to study the Hawaiian health system during her visit.

Hillary Clinton planned to stay in Hawaii for the remainder of the week to get an even more in-depth look at the state's health care system.

The AMA, which has been promoting its reform plan since 1990, calls for insurance reform, Medicaid and Medicare reforms, cost containment, professional liability reforms and mandated employer health coverage.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

AMA embarks on new fee-for-service approach

The AMA's Board of Trustees is currently studying a detailed plan to enable fee-for-service physicians to offer predictable costs—a benefit usually attributed to managed care plans. The Association launched this critical new initiative to maintain fee-for-service practices in its drive for health system reform.

Relative values of the resource-based relative value scale could form the basis for public and private sector physician payment, with physicians and payers setting their own dollar conversion factors, which are multiplied under the RBRVS to calculate the fee.

Under the Board's approval, widely publicized conversion factors would allow patients to easily compare the costs of physicians' services. Widely publicized payor conversion factors would allow patients to accurately estimate potential out-of-pocket costs as well as the adequacy of health insurance benefits.

For patients, this means free choice of physician, competitive premiums and predictable out-of-pocket expenses. For physicians, this means that strengthened market forces will regulate their fees rather than government price controls.

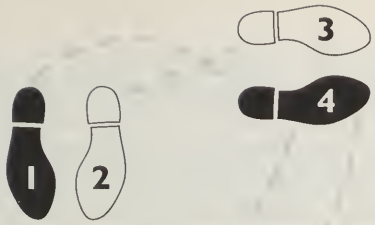
Lobbying helps scale back Medicare cuts

The U.S. Senate voted to reduce Medicare cuts in the finance committee's version of the reconciliation by $9 billion. This action was led by Sens. Paul Wellstone (D, Minn.), Tom Harkin (D, Iowa) and Barbara Mikulski (D, Md.).

The scaling back of the Medicare cuts was in large part due to AMA and medical society lobbying efforts.

Another important AMA action that helped convince Senate leadership to offer the amendment reducing the cuts was an AMA letter to the full Senate. The letter urged each senator to protect the Medicare and Medicaid programs by limiting excessive spending reductions and avoiding micromanagement of the programs.

Sen. Wellstone's staff told the AMA that its efforts greatly contributed to the victory to reduce the Medicare cuts.



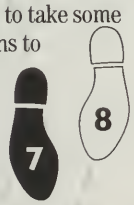
AMA sues DEA over fees

In June, the AMA, along with other co-plaintiff medical organizations, sued the Drug Enforcement Administration over the new excessive registration fees imposed on physicians.

The DEA's Final Rule announced in March nearly quadrupled fees for those who prescribe, dispense, manufacture or distribute controlled substances to fund a drug Conversion Control Program.

Although most physicians are willing to help stop illegal diversion of controlled substances, the DEA's final rule does not define the program's scope or operations, explain the relationship between the fee and program activities, justify the large fee increase or justify fee distribution.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

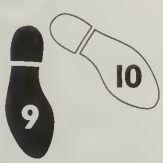


Leading is easy when you know the right steps.

Interactions
Medical Staff Leadership Conference on Managing Change

October 1-3, 1993 Naples, Florida

We can't dance around the issue any longer. Health system reform is occurring at a fast pace. And it's going to take some fancy footwork for physicians to maintain autonomy and control within their practices.



Master the moves that will help you excel in this environment by attending the fourth annual Interactions Medical Staff Leadership Conference: Managing Change. Sponsored by the American Medical Association (AMA), in cooperation with the Medical Association of Georgia and the Florida Medical Association, this comprehensive three-day conference is designed specifically for new and experienced medical staff leaders.

Physician leaders will benefit by:

- Learning how to hone their leadership skills
- Gaining a greater understanding of health policy and medical practice issues
- Acquiring the knowledge and tools to deal with the changes surrounding health system reform

So lead, don't follow. It's easy, when you know the right steps. For more information or to register, call **800 621-8335** now!

Another Kind of Investment. It's Boring!

With this investment, you get no blast the...no sip of Dom...no rush of watching dice bound over the green felt. So, if the thrill of the gamble drives your investing, we can't dance. Our investment is boring. For us there are no administrative costs and no sales commissions. But for our investors, there are no anxious moments. For our investors, the average annual yield over the past five years has exceeded 10%. But their investment is nap-inducing. Our investors watch the mailbox (rather than the agate print in The Wall Street Journal) to measure their gains, because each of them receives a monthly check. But they yawn all the way to the bank. You see, with a 1% risk factor in this investment, the gamble simply isn't there. That's why we never get to dance with the high rollers who love the epinephrine flow that comes with the gamble. For more information about this ho-hum investment, call toll free: **800/876-6784.**

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, Maryland 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Cardiovascular risk factors in the elderly, medical and pharmacologic management, at the Baltimore Grand, Baltimore, Maryland. 7 Cat 1 AMA/PRA credits. Fee: $60 physicians. Info: Reba Cornman, 410-706-4327. — **Oct. 5**

Miscellaneous meetings

Imaging the augmented breast, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Sept. 2**

1993 Med Chi semiannual meeting, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Vivian Smith, 410-539-0872 or 800-492-1056. — **Sept. 10–12**

The decade of the brain: An international conference, sponsored by the George Washington University, at the Omni-Shoreham, Washington, DC. 28 Cat 1 AMA/PRA credits. Fee: $550 physicians; $330 residents and fellows; $250 other health professionals. Info: John F. Vargo, 202-994-4285. — **Sept. 11–14**

5th annual trauma conference, sponsored by the Peninsula Regional Medical Center, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Darlene Kwiatkowski, 410-543-7328. — **Sept. 16–17**

14th international congress of lymphology, sponsored by the International Society of Lymphology (ISL). Part 1: "Frontiers in Lymphology" at the Hyatt Regency, Baltimore, Maryland. Part 2: "Lymphology in 1993" at the Ramada Renaissance Techworld, Washington, DC. Info: Grace Wagner, Program Coordinator, 602-626-6118. — **Sept. 20–26**

Congenital heart disease in adolescents and adults, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Sept. 27–29**

Tumor conference	**Aug. 26**

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, Maryland 21205 (410-955-2959).

2nd annual update on obstetric anesthesia plus an optional fiberoptic airway management workshop, at the Hyatt Regency Inner Harbor, Baltimore, Maryland. 12 Cat 1 AMA/PRA credits. Fee: $275 physicians; $175 CRNAs; $75 residents and fellows. **Aug. 21–22**

Pediatrics for the practitioner—Update 1993. Cat 1 AMA/PRA credits available. **Sept. 9–10**

7th annual core content of emergency medicine: A comprehensive review, at the Marriott Hotel, Baltimore-Washington International Airport, Baltimore, Maryland. Cat 1 AMA/PRA credits available. Fee $995. **Sept. 10–16**

22nd annual diagnostic ultrasound in gynecology and obstetrics and abdomen, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 16.5 Cat 1 AMA/PRA credits. Fee: physicians: 3 days, $400; 2 days, $300; 1 day, $150. **Sept. 17–19**

Rising to the challenge: Crisis intervention in the critical care setting. Cat 1 AMA/PRA credits available. Fee: $75. **Oct. 4**

19th annual topics in gastroenterology and liver disease. Cat 1 AMA/PRA credits available. Fee $495 physicians; $250 residents and fellows. **Oct. 6–8**

35th annual Emil Novak memorial course. 45 AMA/PRA credits; 53 ACOG cognates ACOG. Fee: $675 physicians; $475 residents, fellows, and allied health professionals. **Oct. 18–23**

Diabetic retinopathy. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 29**

Practical management of the uveitis patient. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 30**

Ethics and politics related to clinical trials. Cat 1 AMA/PRA credits available. Fee: TBA. **Nov. 3–4**

Progress in pediatrics. 11 Cat 1 AMA/PRA credits. Fee: $140 physicians; $80 residents and fellows. **Nov. 5–6**

Update on sinusitis. Cat 1 AMA/PRA credits available. Fee: TBA. **Nov. 8**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

Continuously throughout the year (continued)

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

PHYSICIAN'S RECOGNITION AWARD

During June 1993, the physicians listed below received the American Medical Association (AMA) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

August, 1993

Selected Communicable Diseases in Maryland in 1992 (Continued)

HAEMOPHILUS INFLUENZAE DISEASE (81)

1.7/100,000 (U.S. 0.5/100,000)

The number of cases of invasive *Haemophilus influenzae* disease reported in Maryland from 1988 through 1992 and by jurisdiction is shown in Table 1 (see July, 1993 issue). Reported cases of *H. influenzae* disease doubled in 1992, compared to 1991 when 40 cases were reported. Thirty-eight percent of all cases occurred in Baltimore City; 16% and 12% were reported from Prince George's and Baltimore counties, respectively. The highest rate per 100,000 population (8.6) was noted in Dorchester County, followed by the rate in Baltimore City (4.2).

The male to female ratio was 0.9:1.0. The ratio of whites to blacks was 1.8:1.0. Figure 3 presents the number of cases from 1987 to 1992 by age group and illustrates the continued and remarkable decline of the illness among children, especially those 3 to 17 months old. Figure 3 shows also the increase of cases reported among persons older than 9 years of age. In 1992, 43 (53.1%) of the reported cases were adults, 20 years of age and older. The highest incidence rate per 100,000 population (6.6) occurred in children, 0 to 4 years of age, followed by the incidence rate in those 70 years and older. Eleven cases were reported among infants less than 2 months of age.

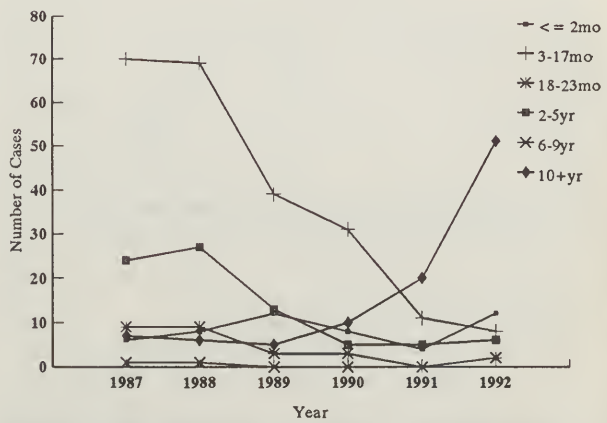

Fig 3. Haemophilus influenzae disease. Cases reported by age group, Maryland, 1987-1992.

Active surveillance for invasive *H. influenzae* disease through hospital infection control practitioners and medical laboratories, which began in November, 1991, continued through 1992. This surveillance and laboratory audits in 1992 is believed to have contributed to the increase of reported cases, especially among adults.

H. influenzae caused the following types of illness: 45 (55.6%) bacteremia, 15 (18.5%) pneumonia, 6 (7.4%) meningitis, 2 (2.5%) cellulitis, 1 (1.2%) peritonitis, 1 pericarditis, 1 epiglottitis, 1 arthritis, and 9 (11.1%)

other infections. Thirteen patients died (for a case fatality rate of 16%), 61 survived, and the outcome for 7 cases is unknown.

H. influenzae isolates from 65 patients showed that 31 (47.7%) were resistant to ampicillin, an increase from 32% in 1991 but still not as high as 57% in 1990.

HEPATITIS A (254)

5.2/100,000 (U.S. 8.4/100,000)

The trend of hepatitis A from 1983 to 1992 is illustrated in Figure 4. The incidence rate in 1992 did not change from the rate in 1991. The number of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). Fifty-five percent of all cases in Maryland was reported from the Baltimore metropolitan area. Baltimore City (89 cases) had the highest rate per 100,000 population (12.1) in the State, followed by Baltimore (7.3), Talbot (6.8), and Anne Arundel (6.2) counties. Hepatitis A did not have a marked seasonal pattern, except for a slight preponderance of illness in the late summer and the autumn.

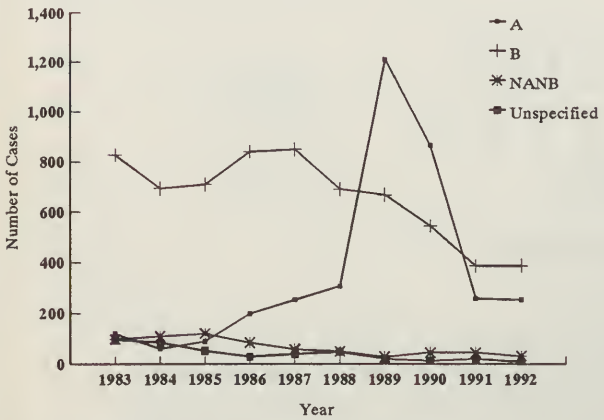

Fig 4. Hepatitis (A, B, NANB, and Unspecified). Cases reported, Maryland, 1983-1992.

The male to female ratio was 1.2:1.0. The ratio of whites to blacks was 6.3:1.0; 15 cases were Asian, 3 were Hispanic, 5 other race, and the race of 35 (13.8%) was not specified. The rate in whites was 5.0/100,000 and the rate in non-whites was 3.3. Age-and sex-specific rates per 100,000 population are presented in Figure 5. The highest incidence rates, 9.4 and 9.2, occurred in males, 30 to 39, and 20 to 29 years of age , respectively. The highest rates among females were noted in age groups 15 to 19 (8.7), 10 to 14 (8.4) and 20 to 29 (8.1) years.

Among the cases with known sex and race (219), non-white (excluding black) females had the highest rate (7.4), followed by non-white (excluding black) males (6.8), white male (5.7), and white female (4.3).

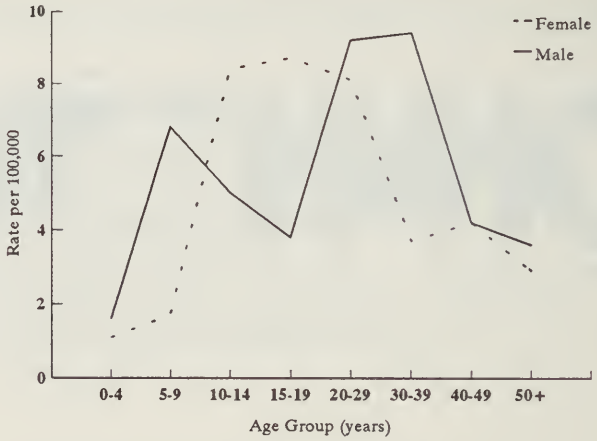

Fig 5. Hepatitis A. Incidence rates by age group and sex, Maryland, 1992.

Of the 125 adults with known occupation (excluding retired, unemployed, homemakers, etc.), 6 (4.8%) were food handlers, 3 (2.4) were health care providers, and 1 (0.8%) was a child day care facility worker.

Of the 114 cases with known workplace, school, child care facility, etc., 6 (5.3%) were working in foodhandling businesses, 4 (3.5) in nursing homes, and 1 (0.9%) in a child care facility; 1 (0.9%) attended a child care facility.

A known or suspected source of infection was reported for 78 (30.7%) of the cases. Of these, 31 (39.7%) had contact with a confirmed or suspected hepatitis A case, 16 (20.5%) had handled and/or consumed potentially contaminated food, 13 (16.7%) were injectable drug users (compared to 12.1% in 1991, 17.9% in 1990, and 22.7% in 1989), 11 (14.1%) were refugees/immigrants from developing countries; 1 (1.3%) had contact with child or employee in nursery or a child care center, and 6 (8.0%) had other exposures.

HEPATITIS B (388)

8.0/100,000 (U.S. 5.9/100,000)

The trend of acute hepatitis B in Maryland during the past 10 years is reflected in Figure 4. The decline which started in 1987 leveled off in 1992; the incidence in 1992 remained the same as in 1991. The number of cases by county is shown in Table 1 (see July, 1993 issue). Baltimore City reported 36.1% of all cases in the State, for a rate of 19.0 per 100,000 population. This represents an increase from the rate in 1991 (18.1), but still not to the level in 1989 and 1990 when Baltimore's rates were 39.5 and 26.1, respectively. Other counties with high rates were Dorchester (16.2), Somerset (12.9), Caroline (10.8), Worcester (10.1), and Prince George's (9.0).

No seasonal pattern was observed. The male to female ratio was 1.5:1.0. The incidence rate in males was 9.9/100,000 and the rate in females was 6.1/100,000. The ratio of whites to blacks was 0.9:1.0; 3 cases were

Hispanic, 2 Asian, and the race of 71 (18.3%) was not specified. The rate per 100,000 population in blacks (13.9) was 3.2 times higher than the rate in whites (4.3). The rate in black males, 35 to 39 years old, was 40.9.

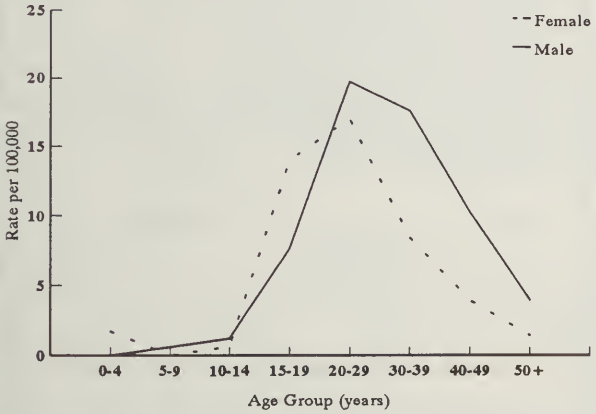

Fig 6. Hepatitis B. Incidence rates by age group and sex, Maryland, 1992.

The incidence rates per 100,000 population by age group and sex are presented in Figure 6. The highest rates were observed in males, 20 to 39 and in females, 20 to 29 years of age.

Of the 94 adults with known occupation (excluding retired, unemployed, homemakers, students, etc.) only 4 (4.3%) were health care providers with direct patient contact and 3 additional cases were known to have been employed in a hospital and an institution for mental/developmental disabilities.

Information on exposure during the 6 months prior to onset of illness and the probable source of infection was available for 107 (27.6%) cases. Of these, 46 (43.0%) admitted illegal drug use (compared to 33.0% in 1991, 31.0% in 1990, and 46.5% in 1989), 18 (16.8%) had heterosexual and unspecified sexual exposure, 17 (15.9%) had contact with a confirmed or suspected hepatitis B case, 6 (5.6%) had blood transfusion, 5 (4.7%) were refugees or immigrants from developing countries, 3 (2.8) had eaten raw shell fish, 2 (1.9%) had had a tattoo, 1 (0.9%) had a needle stick injury, 1 (0.9%) had dental work, 8 (7.5%) had other exposures.

HEPATITIS NANB (31)

0.6/100,000 (U.S. 2.2/100,000)

The incidence rate of acute NANB (non A/non B) hepatitis in 1992 declined from the rate in 1991 (0.9/100,000). The reported cases decreased by 31.1%. The 10 year trend of NANB hepatitis in Maryland is illustrated in Figure 4. The number of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). More than half of the cases (54.8%) occurred in Baltimore County and Baltimore City. The highest rate per 100,000 population (5.1) was noted in Worcester County, followed by the rate in Talbot County (3.4).

The male to female ratio was 0.9:1.0. The rates per 100,000 population in males and females were 0.3 and 0.6, respectively. The ratio of whites to blacks was 1.2:1.0. The rate per 100,000 population in blacks (1.2) was more than double the rate in whites (0.5).

There were no cases less than 20 years of age. Patients, 30 to 49 years of age, had the highest rates, including black males, 35 to 39, and black females, 40 to 44 years of age, whose rates were 6.5 and 6.2, respectively.

The suspected source of infection during the 6 months prior to onset of illness was reported for 15 (48.4%) of the cases. Of these, 10 (66.7%) were illegal drug users (compared to 52.2% in 1991, and 50.0% in 1990), 1 (6.7%) had received blood or blood products by transfusion, 1 had been exposed to a NANB case, 1 had sexual exposure, 1 had a needle stick, and 1 had had a tattoo.

LEGIONELLOSIS (39)

0.8/100,000 (U.S. 0.5/100,000)

Legionellosis increased slightly from 1991 when 34 cases were reported. Fifteen of the 24 jurisdictions in Maryland reported cases; the numbers by county are shown in Table 1 (see July, 1993 issue). More than one third of all cases (35.9%) were reported from Baltimore City (6 cases) and Baltimore County (8 cases). Washington County (3 cases), as in previous years, had one of the highest rates in the State (2.5/100,000). No marked seasonality was noted.

The male to female ratio was 0.7:1.0. Females had a higher incidence rate (0.9) than males (0.7). The ratio of whites to non-whites was 3.4:1.0; the race of 4 cases was unknown.

Ages ranged from 23 to 86 years (mean 59, median 60 years); the age of 1 person was unknown.

The incidence rate per 100,000 population by age group and sex is shown in Figure 7.

Information on possible source of exposure in the 2 weeks before onset of illness and/or underlying medical conditions was available for 19 (48.7%) cases. Of these 9 (47.4%) were smokers of more than 10 cigarettes per day (including 2 who recently had quit smoking), 4 (21.1%) were undergoing systemic corticosteroid treatment, 2 (10.5%) had visited a hospital and an emergency room, 2 (10.5%) had cancer, 1 (5.3%) had diabetes mellitus, and 1 had history of out-of-state travel. In addition, 10 patients had indicated during the investigation no possible source of exposure nor predisposing factor.

Six deaths occurred for a case fatality rate of 17.6%; the outcome for 5 patients was unknown.

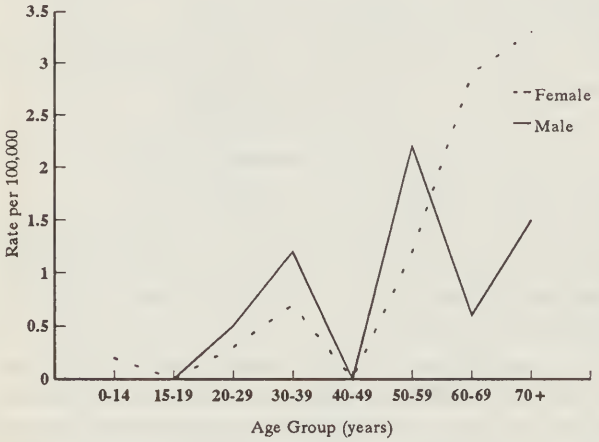

Fig 7. Legionellosis. Incidence rates by age group and sex, Maryland, 1992.

LYME DISEASE (185)

3.8/100,000 (U.S. 3.1/100,000)

In 1992 Lyme disease decreased by 34.6% from 1991 (283 cases). This is the first decline of reported cases since the first Maryland case was diagnosed and reported in Cecil County in 1979; this could be due to a less aggressive follow-up of Lyme antibody laboratory test results to identify additional cases. The trend of Lyme disease in the past 6 years in illustrated in Figure 8. In 1992, every county, except Allegany, Frederick, and Garrett, reported cases. The number of cases by jurisdiction are shown in Table 1 (see July, 1993 issue), and in Table 2, which also indicates the incidence rates per 100,000 population from 1990 to 1992.

Eighty-one percent of all cases had onset of illness in April through September; the peak incidence was in June (49 cases) and July (46 cases).

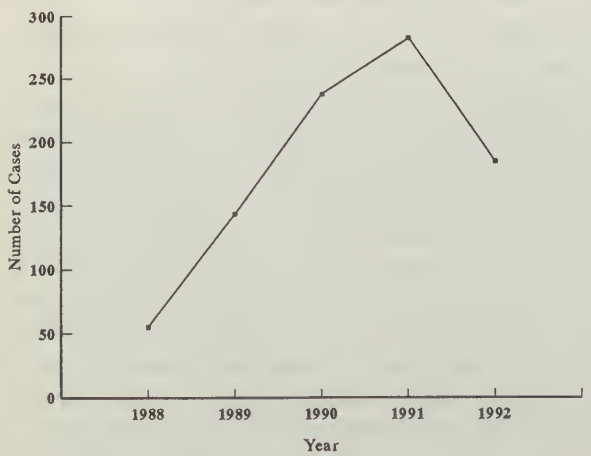

Fig 8. Lyme disease. Cases reported, Maryland, 1988-1992.

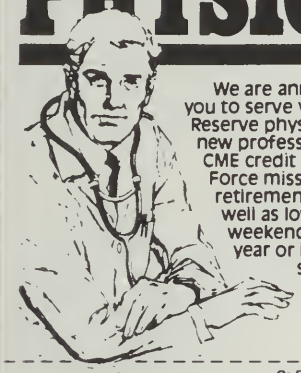
The male to female ratio was 1.5:1.0. Among the cases with known race (182), 164 (90.1%) were white, 13 (7.1%) black, and 5 (2.8%) other race. Ages ranged from 1 to 81 years (mean 34, median 32 years).

Of the 185 cases, 133 (71.9%) had erythema migrans, 54 (29.2%) had arthritis, 16 (8.6%) had Bell's palsy, 12 (6.5) had erythema migrans and arthritis, 6 (3.2%) had radiculoneuropathy, 4 (2.2%) had cardiologic symptoms, and 3 (1.6) had encephalitis. Thirty-two (17.3%) patients required hospitalization.



A definite tick bite prior to onset of illness was reported by 66 (35.7%) cases; 88 (47.6%) had no known tick exposure, and for 38 (20.5%) there was no exposure information available.

Table 2. Lyme Disease in Maryland 1990-1992

MMJ Classified Advertising

Prepayment is required for all classified advertising.

- Cost for Med Chi members is $5.00 per 35 characters or portion thereof (each letter, number, symbol, punctuation mark, or space counts as one character).
- Cost for nonmembers is $8.00 per 35 characters or portion thereof with a minimum cost of $50.00 per advertisement.
- Advertisements placed for the benefit of an HMO or a hospital are charged the nonmember rate.
- Advertisements for services (e.g., collection agencies) or for items not related to the practice of medicine (e.g., real estate sales) are limited to a maximum of three placements per calendar year.
- Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physicians's practice or equipment.
- Box numbers are provided free of charge.
- Advertising copy and payment (checks should be made out to *Maryland Medical Journal*) should be sent seven weeks prior to the first of the month in which the advertisement is to appear.

Box replies, advertising copy, and prepayments should be sent to:

SOUND PROTECTION

Choosing a professional liability insurer is a major decision–too important to play by ear.

Princeton Insurance Company's high-quality investment portfolio and our conservative approach to loss reserving have made us the choice of 22,000 in the medical and health care community.

We're not just blowing our own horn. Standard & Poor's has awarded us a claims-paying ability rating of "A."

That's sound protection through financial strength and stability.

Princeton. It's worth it!

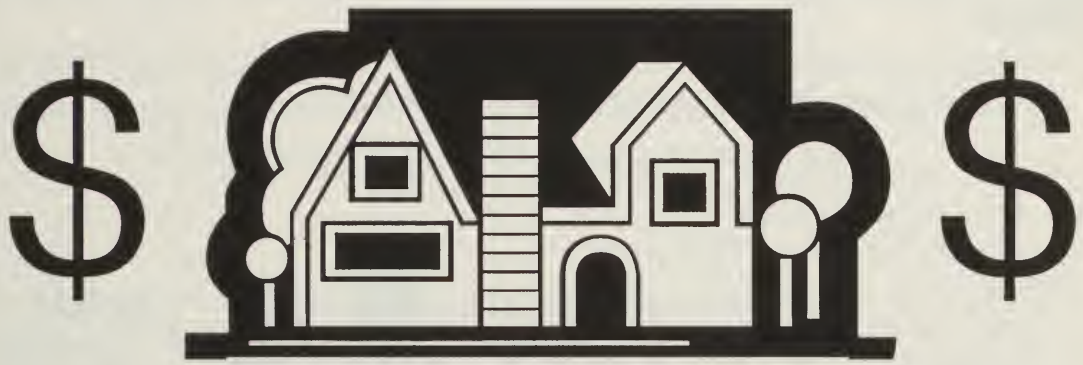
Straight Talk. Doctor-To-Doctor.

When you're tired of playing games with risk retention groups or insurance companies, we'll be glad to give you the straight talk you need to make your best choices.

Straight talk about coverage options, premium discounts, free retirement coverage, risk management programs, and all the kinds of choices doctors really need.

Where did we learn to talk like this? Simple. We're run by doctors, and doctors are too busy to play games.

To learn more about joining the thousands of your physician colleagues insured by Medical Mutual, call us at 1-800-492-0193.



Doctor-to-doctor. What better way to hear it straight?

Quality Service to Our Physicians and Patients!

YOU DON'T HAVE TO PUT OFF UNTIL TOMORROW WHAT YOUR FAMILY DESERVES TODAY.

RIVER FALLS
Potomac's Family Community

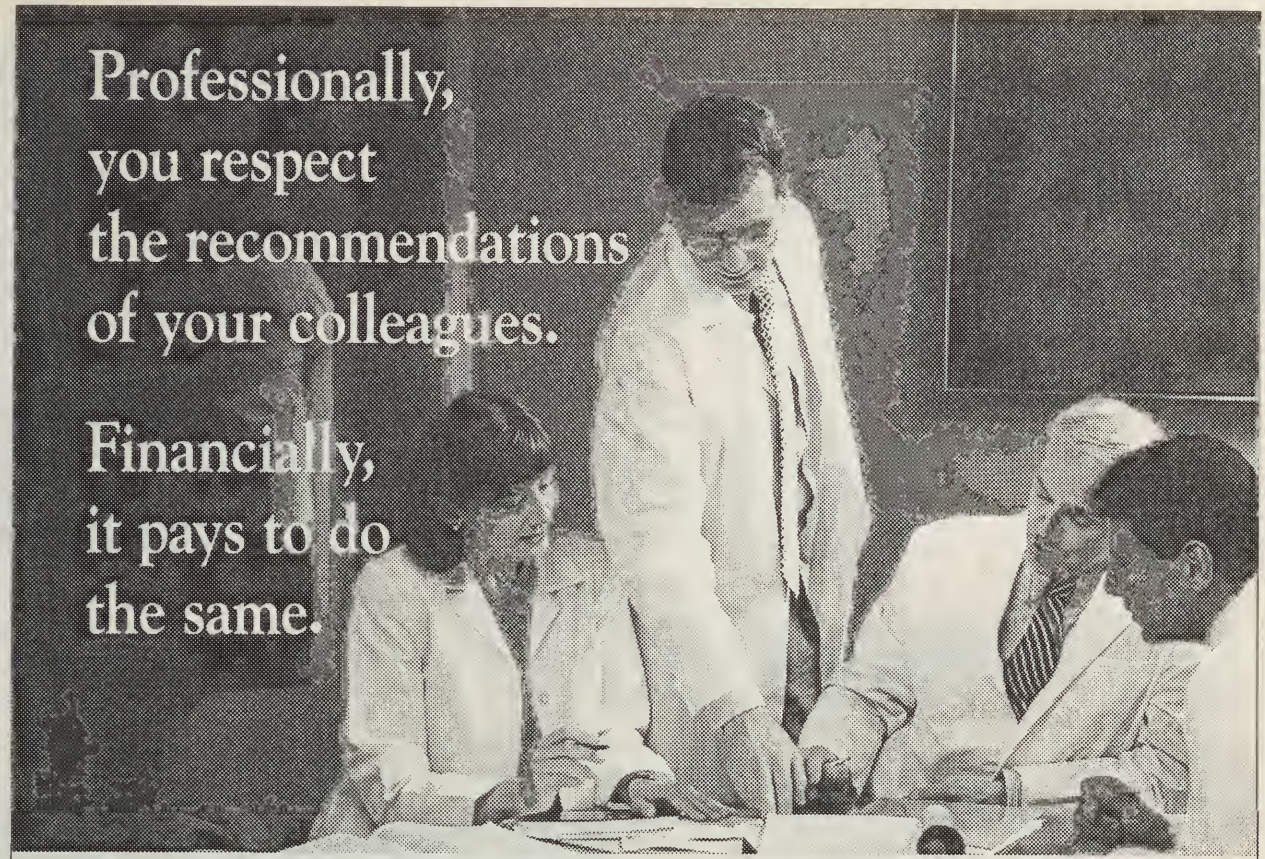
Right now, the design, the quality and the unique lifestyle of a River Falls home are an all-time best buy. This new generation of Gosnell-built homes are designed with every amenity and offer floor plans that make living easy plus offer the opportunity to customize to your family's lifestyle.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Three, four and even five bedroom homes start in the $600's with absolutely no compromise in quality. There's still terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go beyond the dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities
- Highly regarded public and private schools



Where else can you get such a sound investment with such outstanding returns? Come see it now.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.

HOURS: 12-5 daily. *PHONE: 301-299-3700.*
Brokers welcome.

Chief Executive Officer's Newsletter

September 1993

Come Hear About Health Care Reform in Maryland

The following three regional meetings, sponsored by Maryland's Health Care Access and Cost Commission (HCACC), have been scheduled to provide information on how Maryland's reform plan will affect business and health practitioners:

Date: September 27, 1993
Time: 2:00 pm - 5:00 pm
Place: Howard Johnson, Hagerstown
1718 Underpass Way

Date: October 4, 1993
Time: 2:00 pm - 5:00 pm
Place: Hyatt Regency, Bethesda
1 Bethesda Metro Center

Date: October 25, 1993
Time: 2:00 pm - 5:00 pm
Place: Wicomico Youth & Civic Center, Salisbury
500 Glen Avenue

The meetings will cover the topics of small group market reform, cost containment, practice parameters, and the plan's relationship to federal reform. Panelists will include: The Honorable Casper R. Taylor, Jr., chairperson, House Economic Matters Committee; The Honorable Thomas P. O'Reilly, chairperson, Senate Finance Committee; William C. Richardson, chairperson, Health Care Access and Cost Commission, and Nelson J. Sabatini, secretary, Department of Health and Mental Hygiene. For additional information, please call the HCACC at 410-764-3460.

Uniform Claim Form

The Maryland Department of Licensing and Regulation, Insurance Division, has promulgated regulations to standardize the forms used in billing and reimbursement of health care, reduce the number of forms utilized, and increase efficiency through standardization. Med Chi responded to these regulations prior to their publication and supported the use of the HCFA 1500 form as the standardized form.

According to the new regulations, physicians will be required to use the HCFA 1500 form when filing claims with third party payers for professional services. Under the regulations, a third party payer may not require a physician to use any other descriptor with a code or to furnish additional information with the initial submission of a HCFA 1500 form except (1) when the procedure code used describes a treatment or service that is not otherwise classified; and (2) when the procedure code is followed by modifiers, in which case the physician may use the HCFA 1500 form to explain the modifiers. Also, the HCFA 1500 form may be used to indicate it is an *amended* version of a form previously submitted by inserting the word, "amended" in Box 19, currently titled "Reserved for Local Use." If billing is

based on the amount of time involved, the physician shall indicate the number of units in Box 24G, currently titled "Days or Units," of the HCFA 1500 form if it is not used to specify the number of days of treatment.

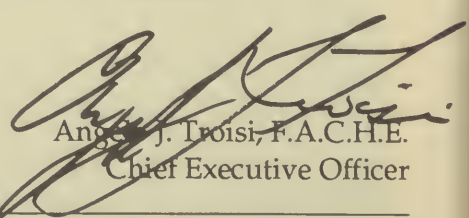
The HCFA 1500 form must be used for any claim received by a third party payer *on* or *after* **October 1, 1993.**

If you have any questions or concerns, please contact Rose Matricciani, chief operating officer, at 410-539-0872 or 1-800-492-1056.

Medicare Claims for Durable Medical Equipment to be Handled by Four Regional Carriers

The Medicare Division of Blue Cross and Blue Shield of Maryland recently announced that the Health Care Financing Administration (HCFA) has consolidated its durable medical equipment claims operations for Medicare beneficiaries, dividing the nation into four separate regions. Maryland falls into Region B, whose carrier for durable medical equipment will become AdminaStar Federal Inc. of Indiana.

All duties associated with the processing of claims for durable medical equipment under Part B of the Medicare Program in Maryland will be performed by AdminaStar Federal beginning October 1, 1993, for beneficiaries in Prince George's and Montgomery counties, and December 1, 1993, for beneficiaries in Maryland's other counties. Only Medicare claims for durable medical equipment and supplies will be affected by this change. All other Medicare claims processing will continue to be administered by Blue Cross and Blue Shield.



Maryland Medicare beneficiaries can contact AdminStar Federal with any questions at 1-800-270-2313.

Computers in Medicine Survey

In order to better understand and monitor the impact computers are having on medical practice, the Med Chi Computers in Medicine Committee requests that you take a few moments to complete and return the survey that follows this issue of the *Chief Executive Officer's Newsletter.*

Med Chi Sponsors Press Conference to announce Initiation of the Maryland Physicians' Campaign Against Family Violence

On September 8, 1993, Med Chi, in conjunction with the Maryland Alliance Against Family Violence, held a press conference to announce the initiation of the Maryland Physicians' Campaign Against Family Violence. The campaign is designed to educate physicians about the prevalence of family violence, its impact on the health of its victims, and the need for intervention by the medical community. The campaign theme is "*Unlock the silence. The key is trust.*" Three areas will be targeted: domestic violence, also known as spouse or partner abuse, child abuse, and elder abuse. The story was covered by WPOC-FM, Baltimore, and WBAL-AM, Baltimore.

Anc[illegible] J. Troisi, F.A.C.H.E.
Chief Executive Officer

Survey: Computer Use in Medical Offices

Dear Colleague:

Computers are having a tremendous impact on the way we practice medicine. In order to better understand and monitor this impact, the Computers in Medicine Committee has prepared this brief questionnaire.

Please take a few moments from your busy schedule to complete the survey. The committee will keep you apprised of the results through the Maryland Medical Journal. *Your participation is greatly appreciated.*

Sincerely,
Dino E. Flores, M.D., F.A.C.S.
Chairperson, Computers in Medicine Committee

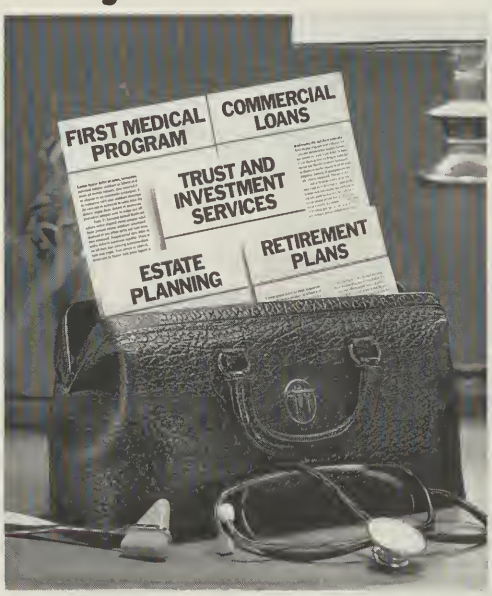
THIS STATE-OF-THE-ART SLEEP STUDY IS BEING CONDUCTED IN LOU JOHNSON'S BEDROOM.

Apnea events during sleep with desaturation from an actual home study.

At the Shady Grove Sleep Centers we are committed to bringing the resources of a well-equipped laboratory into the home environment. Although the results are not as complete as studies conducted in a conventional sleep lab, they are usually clinically diagnostic and considerably more pleasant and reassuring to the patient.

Shady Grove is fully accredited by the ASDA, and all tests are conducted by trained sleep technicians under the direction of Registered Technicians. Interpretations are performed by board-certified sleep physicians. We also operate the other facilities listed below.



Our technology includes nine-channel recording and review of raw data.

The several benefits of in-house sleep studies have been noted in a recent ASDA paper. We will welcome the opportunity to share them with you. Call us at 1•800•AWAKEN•1.

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Investment Counsel Group

"Ron's Rule—I give myself one week to meet new people and start having fun on a locum tenens assignment. It hasn't failed me yet."

Ron Richmond, MD, joined the CompHealth locum tenens medical staff when he completed his residency. He wanted to travel. He loves to meet people. A little time off sounded really good. And he thinks being exposed to different types of medical practice will serve him well when he returns to his hometown to establish a community health center.

A singer. A board-certified family practitioner. A soft-spoken New Yorker. Ron Richmond knows...

It's a great way to practice medicine

Discover The Elegance Of A Hybrid

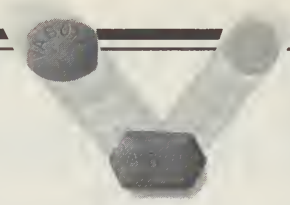
At first glance, it's the ***beauty*** of a rose that catches the eye. The vibrant color. The delicately shaped petals. But study it more closely, and its ***elegance*** becomes apparent—a gentle blend of softness and strength.

At first glance, it's the ***enhanced performance*** of Vaseretic that catches the eye. But study Vaseretic more closely, and its ***elegance*** becomes apparent. The way its one-tablet, once-a-day dosage minimizes multiple medications. Minimizes insurance copayments. And minimizes potassium supplementation.

A hybrid ***blending of tolerability and power*** that's available for the right patient. Vaseretic is indicated for the treatment of hypertension in patients for whom combination therapy is appropriate.

And an elegant discovery for your practice.

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, Vaseretic® (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*



VASERETIC® 10-25 *Next*
Enalapril Maleate-Hydrochlorothiazide

Dosage must be individualized; the fixed combination is not for initial therapy.

Evaluation of the hypertensive patient should always include assessment of renal function.

For a Brief Summary of Prescribing Information, see adjacent pages.

TABLETS
VASERETIC®
(ENALAPRIL MALEATE-HYDROCHLOROTHIAZIDE)

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC® (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*

CONTRAINDICATIONS: VASERETIC is contraindicated in patients who are hypersensitive to any component of this product and in patients with a history of angioedema related to previous treatment with an angiotensin converting enzyme inhibitor. Because of the hydrochlorothiazide component, this product is contraindicated in patients with anuria or hypersensitivity to other sulfonamide-derived drugs.

WARNINGS: *General; Enalapril Maleate; Hypotension:* Excessive hypotension was rarely seen in uncomplicated hypertensive patients but is a possible consequence of enalapril use in severely salt/volume depleted persons such as those treated vigorously with diuretics or patients on dialysis.

Syncope has been reported in 1.3 percent of patients receiving VASERETIC. In patients receiving enalapril alone, the incidence of syncope is 0.5 percent. The overall incidence of syncope may be reduced by proper titration of the individual components. (See PRECAUTIONS, *Drug Interactions*, and ADVERSE REACTIONS.)

In patients with severe congestive heart failure, with or without associated renal insufficiency, excessive hypotension has been observed and may be associated with oliguria and/or progressive azotemia, and rarely with acute renal failure and/or death. Because of the potential fall in blood pressure in these patients, therapy should be started under very close medical supervision. Such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart or cerebrovascular disease, in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident.

If hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses, which usually can be given without difficulty once the blood pressure has increased after volume expansion.

Angioedema: Angioedema of the face, extremities, lips, tongue, glottis and/or larynx has been reported in patients treated with angiotensin converting enzyme inhibitors, including enalapril. In such cases VASERETIC should be promptly discontinued and appropriate therapy and monitoring should be provided until complete and sustained resolution of signs and symptoms has occurred. In instances where swelling has been confined to the face and lips the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis or larynx, likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL) and/or measures necessary to ensure a patent airway, should be promptly provided.** (See ADVERSE REACTIONS.)

Patients with a history of angioedema unrelated to ACE inhibitor therapy may be at increased risk of angioedema while receiving an ACE inhibitor (see also CONTRAINDICATIONS).

Neutropenia/Agranulocytosis: Another angiotensin converting enzyme inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Hydrochlorothiazide: Thiazides should be used with caution in severe renal disease. In patients with renal disease, thiazides may precipitate azotemia. Cumulative effects of the drug may develop in patients with impaired renal function.

Thiazides should be used with caution in patients with impaired hepatic function or progressive liver disease, since minor alterations of fluid and electrolyte balance may precipitate hepatic coma.

Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma.

The possibility of exacerbation or activation of systemic lupus erythematosus has been reported.

Lithium generally should not be given with thiazides (see PRECAUTIONS, *Drug Interactions, Enalapril Maleate and Hydrochlorothiazide).*

Pregnancy; Enalapril-Hydrochlorothiazide: There was no teratogenicity in rats given up to 90 mg/kg/day of enalapril (150 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose) or in mice given up to 30 mg/kg/day of enalapril (50 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose). At these doses, fetotoxicity expressed as a decrease in average fetal weight occurred in both species. No fetotoxicity occurred at lower doses; 30/10 mg/kg/day of enalapril-hydrochlorothiazide in rats and 10/10 mg/kg/day of enalapril-hydrochlorothiazide in mice.

When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC should be discontinued as soon as possible. (See *Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality,* below.)

Enalapril Maleate; Fetal/Neonatal Morbidity and Mortality: ACE inhibitors can cause fetal and neonatal morbidity and death when administered to pregnant women. Several dozen cases have been reported in the world literature. When pregnancy is detected, ACE inhibitors should be discontinued as soon as possible.

The use of ACE inhibitors during the second and third trimesters of pregnancy has been associated with fetal and neonatal injury, including hypotension, neonatal skull hypoplasia, anuria, reversible or irreversible renal failure, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function; oligohydramnios in this setting has been associated with fetal limb contractures, craniofacial deformation, and hypoplastic lung development. Prematurity, intrauterine growth retardation, and patent ductus arteriosus have also been reported, although it is not clear whether these occurrences were due to the ACE-inhibitor exposure.

These adverse effects do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. Mothers whose embryos and fetuses are exposed to ACE inhibitors only during the first trimester should be so informed. Nonetheless, when patients become pregnant, physicians should make every effort to discontinue the use of VASERETIC as soon as possible.

Rarely (probably less often than once in every thousand pregnancies), no alternative to ACE inhibitors will be found. In these rare cases, the mothers should be apprised of the potential hazards to their fetuses, and serial ultrasound examinations should be performed to assess the intraamniotic environment.

If oligohydramnios is observed, VASERETIC* should be discontinued unless it is considered lifesaving for the mother. Contraction stress testing (CST), a non-stress test (NST), or biophysical profiling (BPP) may be appropriate, depending upon the week of pregnancy. Patients and physicians should be aware, however, that oligohydramnios may not appear until after the fetus has sustained irreversible injury.

Infants with histories of *in utero* exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Exchange transfusion or dialysis may be required as means of reversing hypotension and/or substituting for disordered renal function. Enalapril, which crosses the placenta, has been removed from neonatal circulation by peritoneal dialysis with some clinical benefit, and theoretically may be removed by exchange transfusion, although there is no experience with the latter procedure.

No teratogenic effects of enalapril were seen in studies of pregnant rats, and rabbits. On a mg/kg basis, the doses used were up to 333 times (in rats), and 50 times (in rabbits) the maximum recommended human dose.

Hydrochlorothiazide; Teratogenic Effects: Reproduction studies in the rabbit, the mouse and the rat at doses up to 100 mg/kg/day (50 times the human dose) showed no evidence of external abnormalities of the fetus due to hydrochlorothiazide. Hydrochlorothiazide given in a two-litter study in rats at doses of 4 - 5. 6 mg/kg/day (approximately 1 - 2 times the usual daily human dose) did not impair fertility or produce birth abnormalities in the offspring. Thiazides cross the placental barrier and appear in cord blood.

Nonteratogenic Effects: These may include fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult.

PRECAUTIONS: *General; Enalapril Maleate; Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe congestive heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with angiotensin converting enzyme inhibitors, including enalapril, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20 percent of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when enalapril has been given concomitantly with a diuretic. This is more likely to occur in patients with pre-existing renal impairment. Dosage reduction of enalapril and/or discontinuation of the diuretic may be required.

Evaluation of the hypertensive patient should always include assessment of renal function.

Hemodialysis Patients: Anaphylactoid reactions have been reported in patients dialyzed with high-flux membranes (e.g., AN 69*) and treated concomitantly with an ACE inhibitor. In these patients consideration should be given to using a different type of dialysis membrane or a different class of antihypertensive agent.

Hyperkalemia: Elevated serum potassium (greater than 5.7 mEq/L) was observed in approximately one percent of hypertensive patients in clinical trials treated with enalapril alone. In most cases these were isolated values which resolved despite continued therapy, although hyperkalemia was a cause of discontinuation of therapy in 0.28 percent of hypertensive patients. Hyperkalemia was less frequent (approximately 0.1 percent) in patients treated with enalapril plus hydrochlorothiazide. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with enalapril. (See *Drug Interactions.)*

Cough: Cough has been reported with the use of ACE inhibitors. Characteristically, the cough is nonproductive, persistent and resolves after discontinuation of therapy. ACE inhibitor-induced cough should be considered as part of the differential diagnosis of cough.

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Hydrochlorothiazide: Periodic determination of serum electrolytes to detect possible electrolyte imbalance should be performed at appropriate intervals. All patients receiving thiazide therapy should be observed for clinical signs of fluid or electrolyte imbalance: hyponatremia, hypochloremic alkalosis, and hypokalemia. Serum and urine electrolyte determinations are particularly important when the patient is vomiting excessively or receiving parenteral fluids. Warning signs or symptoms of fluid and electrolyte imbalance, irrespective of cause, include dryness of mouth, thirst, weakness, lethargy, drowsiness, restlessness, confusion, seizures, muscle pains or cramps, muscular fatigue, hypotension, oliguria, tachycardia, and gastrointestinal disturbances such as nausea and vomiting.

Hypokalemia may develop, especially with brisk diuresis, when severe cirrhosis is present, or after prolonged therapy. Interference with adequate oral electrolyte intake will also contribute to hypokalemia. Hypokalemia may cause cardiac arrhythmia and may also sensitize or exaggerate the response of the heart to the toxic effects of digitalis (e.g., increased ventricular irritability). Because enalapril reduces the production of aldosterone, concomitant therapy with enalapril attenuates the diuretic-induced potassium loss (see *Drug Interactions, Agents Increasing Serum Potassium).*

Although any chloride deficit is generally mild and usually does not require specific treatment except under extraordinary circumstances (as in liver disease or renal disease), chloride replacement may be required in the treatment of metabolic alkalosis.

Dilutional hyponatremia may occur in edematous patients in hot weather; appropriate therapy is water restriction, rather than administration of salt except in rare instances when the hyponatremia is life-threatening. In actual salt depletion, appropriate replacement is the therapy of choice.

Hyperuricemia may occur or frank gout may be precipitated in certain patients receiving thiazide therapy.

In diabetic patients dosage adjustments of insulin or oral hypoglycemic agents may be required. Hyperglycemia may occur with thiazide diuretics. Thus latent diabetes mellitus may become manifest during thiazide therapy.

The antihypertensive effects of the drug may be enhanced in the postsympathectomy patient.

If progressive renal impairment becomes evident consider withholding or discontinuing diuretic therapy.

Thiazides have been shown to increase the urinary excretion of magnesium; this may result in hypomagnesemia.

Thiazides may decrease urinary calcium excretion. Thiazides may cause intermittent and slight elevation of serum calcium in the absence of known disorders of calcium metabolism. Marked hypercalcemia may be evidence of hidden hyperparathyroidism. Thiazides should be discontinued before carrying out tests for parathyroid function.

Increases in cholesterol and triglyceride levels may be associated with thiazide diuretic therapy.

Information for Patients; Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

Pregnancy: Female patients of childbearing age should be told about the consequences of second- and third-trimester exposure to ACE inhibitors, and they should also be told that these consequences do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. These patients should be asked to report pregnancies to their physicians as soon as possible.

NOTE: As with many other drugs, certain advice to patients being treated with VASERETIC is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions; Enalapril Maleate; Hypotension—Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted, may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS.)

Agents Causing Renin Release: The antihypertensive effect of enalapril is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: Enalapril has been used concomitantly with beta adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine and prazosin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: Enalapril attenuates diuretic-induced potassium loss. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia they should be used with caution and with frequent monitoring of serum potassium.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant enalapril and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Hydrochlorothiazide; When administered concurrently the following drugs may interact with thiazide diuretics:

Alcohol, barbiturates, or narcotics—potentiation of orthostatic hypotension may occur.

Antidiabetic drugs (oral agents and insulin)—dosage adjustment of the antidiabetic drug may be required.

Other antihypertensive drugs—additive effect or potentiation.

Cholestyramine and colestipol resins—Cholestyramine and colestipol resins bind the hydrochlorothiazide and reduce its absorption from the gastrointestinal tract by up to 85 and 43 percent, respectively. Thiazides may be administered two to four hours before the resin when the two drugs are used concomitantly.

Corticosteroids, ACTH—intensified electrolyte depletion, particularly hypokalemia.

Pressor amines (e.g., norepinephrine)—possible decreased response to pressor amines but not sufficient to preclude their use.

Skeletal muscle relaxants, nondepolarizing (e.g., tubocurarine)—possible increased responsiveness to the muscle relaxant.

Lithium—should not generally be given with diuretics. Diuretic agents reduce the renal clearance of lithium and add a high risk of lithium toxicity. Refer to the package insert for lithium preparations before use of such preparations with VASERETIC.

Non-steroidal Anti-inflammatory Drugs—In some patients, the administration of a non-steroidal anti-inflammatory agent can reduce the diuretic, natriuretic, and antihypertensive effects of loop, potassium-sparing and thiazide diuretics. Therefore, when VASERETIC and non-steroidal anti-inflammatory agents are used concomitantly, the patient should be observed closely to determine if the desired effect of the diuretic is obtained.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Enalapril in combination with hydrochlorothiazide was not mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril-hydrochlorothiazide did not produce DNA single strand breaks in an *in vitro* alkaline elution assay in rat hepatocytes or chromosomal aberrations in an *in vivo* mouse

YOCON®
YOHIMBINE HCl

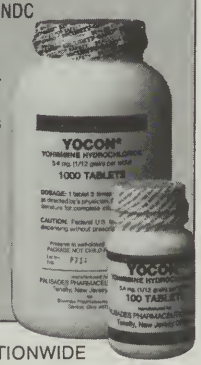
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

bone marrow assay.

Enalapril Maleate: There was no evidence of a tumorigenic effect when enalapril was administered for 106 weeks to rats at doses up to 90 mg/kg/day (150 times* the maximum daily human dose). Enalapril has also been administered for 94 weeks to male and female mice at doses up to 90 and 180 mg/kg/day, respectively, (150 and 300 times* the maximum daily dose for humans) and showed no evidence of carcinogenicity.

Neither enalapril maleate nor the active diacid was mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril was also negative in the following genotoxicity studies: rec-assay, reverse mutation assay with *E. coli*; sister chromatid exchange with cultured mammalian cells, and the micronucleus test with mice, as well as in an *in vivo* cytogenic study using mouse bone marrow.

There were no adverse effects on reproductive performance in male and female rats treated with 10 to 90 mg/kg/day of enalapril.

Hydrochlorothiazide: Two-year feeding studies in mice and rats conducted under the auspices of the National Toxicology Program (NTP) uncovered no evidence of a carcinogenic potential of hydrochlorothiazide in female mice (at doses of up to approximately 600 mg/kg/day) or in male and female rats (at doses of up to approximately 100 mg/kg/day). The NTP, however, found equivocal evidence for hepatocarcinogenicity in male mice.

Hydrochlorothiazide was not genotoxic *in vitro* in the Ames mutagenicity assay of *Salmonella typhimurium* strains TA 98, TA 100, TA 1535, TA 1537, and TA 1538 and in the Chinese Hamster Ovary (CHO) test for chromosomal aberrations, or *in vivo* in assays using mouse germinal cell chromosomes, Chinese hamster bone marrow chromosomes, and the *Drosophila* sex-linked recessive lethal trait gene. Positive test results were obtained only in the *in vitro* CHO Sister Chromatid Exchange (clastogenicity) and in the Mouse Lymphoma Cell (mutagenicity) assays, using concentrations of hydrochlorothiazide from 43 to 1300 µg/mL, and in the *Aspergillus nidulans* non-disjunction assay at an unspecified concentration.

Hydrochlorothiazide had no adverse effects on the fertility of mice and rats of either sex in studies wherein these species were exposed, via their diet, to doses of up to 100 and 4 mg/kg, respectively, prior to conception and throughout gestation.

Pregnancy: Pregnancy Categories C (first trimester) *and D* (second and third trimesters). See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Nursing Mothers: Enalapril and enalaprilat are detected in human milk in trace amounts. Thiazides do appear in human milk. Because of the potential for serious reactions in nursing infants from either drug, a decision should be made whether to discontinue nursing or to discontinue VASERETIC, taking into account the importance of the drug to the mother.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS: VASERETIC has been evaluated for safety in more than 1500 patients, including over 300 patients treated for one year or more. In clinical trials with VASERETIC no adverse experiences peculiar to this combination drug have been observed. Adverse experiences that have occurred, have been limited to those that have been previously reported with enalapril or hydrochlorothiazide.

The most frequent clinical adverse experiences in controlled trials were: dizziness (8.6 percent), headache (5.5 percent), fatigue (3.9 percent) and cough (3.5 percent). Adverse experiences occurring in greater than two percent of patients treated with VASERETIC in controlled clinical trials were: muscle cramps (2.7 percent), nausea (2.5 percent), asthenia (2.4 percent), orthostatic effects (2.3 percent), impotence (2.2 percent), and diarrhea (2.1 percent).

Clinical adverse experiences occurring in 0.5 to 2.0 percent of patients in controlled trials included: *Body As A Whole:* Syncope, chest pain, abdominal pain; *Cardiovascular:* Orthostatic hypotension, palpitation, tachycardia; *Digestive:* Vomiting, dyspepsia, constipation, flatulence, dry mouth; *Nervous/Psychiatric:* Insomnia, nervousness, paresthesia, somnolence, vertigo; *Skin:* Pruritus, rash; *Other:* Dyspnea, gout, back pain, arthralgia, diaphoresis, decreased libido, tinnitus, urinary tract infection.

Angioedema: Angioedema has been reported in patients receiving VASERETIC (0.6 percent). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis and/or larynx occurs, treatment with VASERETIC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In clinical trials, adverse effects relating to hypotension occurred as follows: hypotension (0.9 percent), orthostatic hypotension (1.5 percent), other orthostatic effects (2.3 percent). In addition syncope occurred in 1.3 percent of patients. (See WARNINGS.)

Cough: See PRECAUTIONS, *Cough.*

Clinical Laboratory Test Findings; Serum Electrolytes: See PRECAUTIONS.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.6 percent of patients with essential hypertension treated with VASERETIC. More marked increases have been reported in other enalapril experience. Increases are more likely to occur in patients with renal artery stenosis. (See PRECAUTIONS.)

Serum Uric Acid, Glucose, Magnesium, and Calcium: See PRECAUTIONS.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g percent and 1.0 vol percent, respectively) occur frequently in hypertensive patients treated with VASERETIC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1 percent of patients discontinued therapy due to anemia.

Liver Function Tests: Rarely, elevations of liver enzymes and/or serum bilirubin have occurred.

Other adverse reactions that have been reported with the individual components are listed below and, within each category, are in order of decreasing severity.

Enalapril Maleate— Enalapril has been evaluated for safety in more than 10,000 patients. In clinical trials adverse reactions which occurred with enalapril were also seen with VASERETIC. However, since enalapril has been marketed, the following adverse reactions have been reported: *Body As A Whole:* Anaphylactoid reactions (see PRECAUTIONS, *Hemodialysis Patients*); *Cardiovascular:* Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances including atrial tachycardia and bradycardia; atrial fibrillation; hypotension; angina pectoris; *Digestive:* Ileus, pancreatitis, hepatic failure, hepatitis (hepatocellular [proven on rechallenge] or cholestatic jaundice), melena, anorexia, glossitis, stomatitis, dry mouth; *Hematologic:* Rare cases of neutropenia, thrombocytopenia and bone marrow depression, a few cases of hemolysis in patients with G-6-PD deficiency have been reported in which a causal relationship to enalapril cannot be excluded; *Nervous System/Psychiatric:* Depression, confusion, ataxia, peripheral neuropathy (e.g., paresthesia, dysesthesia); *Urogenital:* Renal failure, oliguria, renal dysfunction (see PRECAUTIONS), flank pain, gynecomastia; *Respiratory:* Pulmonary infiltrates, bronchospasm, pneumonia, bronchitis, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection; *Skin:* Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, alopecia, flushing, photosensitivity; *Special Senses:* Blurred vision, taste alteration, anosmia, conjunctivitis, dry eyes, tearing.

Miscellaneous: A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgia/arthritis, myalgia, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash and other dermatologic manifestations.

Fetal/Neonatal Morbidity and Mortality: See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Hydrochlorothiazide—Body as a Whole: Weakness; *Digestive:* Pancreatitis, jaundice (intrahepatic cholestatic jaundice), sialadenitis, cramping, gastric irritation, anorexia; *Hematologic:* Aplastic anemia, agranulocytosis, leukopenia, hemolytic anemia, thrombocytopenia; *Hypersensitivity:* Purpura, photosensitivity, urticaria, necrotizing angiitis (vasculitis and cutaneous vasculitis), fever, respiratory distress including pneumonitis and pulmonary edema, anaphylactic reactions; *Musculoskeletal:* Muscle spasm; *Nervous System/Psychiatric:* Restlessness; *Renal:* Renal failure, renal dysfunction, interstitial nephritis (see WARNINGS); *Skin:* Erythema multiforme including Stevens-Johnson syndrome, exfoliative dermatitis including toxic epidermal necrolysis, alopecia; *Special Senses:* Transient blurred vision, xanthopsia.

* Based on patient weight of 50 kg.

◆ *Call to order*

The 339th session of the House of Delegates was called to order by the president and chairperson, Jose M. Yosuico, M.D., at 3:20 p.m.

◆ *Invocation*

James Davis, M.D., past president of the American Medical Association(AMA) and parliamentarian, delivered the invocation.

◆ *Pledge of allegiance*

The House of Delegates was led in the pledge of allegiance by the Capitol Brass Quintet, which had played patriotic music as the House of Delegates was assembling. Dr. Yosuico thanked the members of the quintet.

◆ *Visiting dignitaries*

Dr. Yosuico mentioned the visiting dignitaries as follows:

- ✧ Raymond Scalettar, M.D., AMA Board of Trustees chairperson
- ✧ President-elect Thomas J. Maxwell, M.D., Delaware Medical Society
- ✧ Vice-President John H. Hobart, M.D., Pennsylvania Medical Society
- ✧ President George E. Broman, M.D., Virginia Medical Society, and his wife Nancy
- ✧ President Harold Weiss, M.D., DC Medical Society, and his wife Barbara
- ✧ James Davis, M.D., past president of the AMA and former speaker of the AMA House of Delegates.

◆ *Announcements*

The chairperson drew the delegation's attention to the announcements contained in the agenda and reminded members that when they had the privilege of the floor, they were to announce their name and component medical society.

◆ *Approval of minutes*

The minutes of the 338th session of the House of Delegates, which was held during the 1992 semiannual meeting, were approved at the October 15, 1992, meeting of the Executive Committee, as mandated by the bylaws. The minutes were adopted also by the House of Delegates as written.

◆ *Necrology*

Carol W. Garvey, M.D (Montgomery County), secretary, made a motion to dispense with the reading of the list of deceased members since the information had been sent out with the call of the meeting. The motion was seconded and approved. The necrology list was as follows:

Allegany County
Ralph W. Ballin, M.D., February 23, 1993
Ralph A. Reiter, M.D., February 8, 1993
Benedict Skitarelic, M.D., December 11, 1992

Anne Arundel County
Jesse L. Wilins, M.D., January 25, 1993
Eva N. Zartman, M.D., May 8, 1992

Baltimore City
Raymond M. Atkins, M.D., November 13, 1992
Gilbert W. Benjamin, M.D., May 20, 1992
Edward Davens, M.D., September 8, 1992
Nachman Davidson, M.D., December 17, 1992
Jivaka B. DeSilva, M.D., November 14, 1992
Martin W. Donner, M.D., April 13, 1992
Eli K. Fraiji, M.D., December 4, 1992
Robert W. Garis, M.D., November 29, 1992
William E. Gilmore, M.D., October 16, 1992
Charles M. Henderson, M.D., January 28, 1992

Harry C. Hull, M.D., December 15, 1992
John Josselson, M.D., October 8, 1992
C. Edward Leach, M.D., October 17, 1992
John W. Machen, M.D., January 4, 1992
Stephen C. Mackowiak, M.D., February 20, 1993
Albert I. Mendeloff, M.D., March 15, 1993
Moses Paulson, M.D., November 14, 1991
Milos B. Radwick, M.D.
M. Elliott Randolph, M.D., February 16, 1992
Gilbert E. Rudman, M.D., March 7, 1993
James Arthur Weinberg, M.D., August 27, 1992
Huntington Williams, M.D., May 4, 1992

Baltimore County

Jose Ardaiz, M.D., February 6, 1993
Edward W. Hopf, M.D., October 1, 1992
Anthony A. Lewandowski, M.D., February 21, 1993
Donald J. Roop, M.D., December 19, 1992
Salvador Rossello, M.D., September 1, 1992
William E. Seabold, M.D., May 28, 1992

Aubrey L. Stafford, M.D., November 3, 1992

◆ *Memorial resolutions*

Dr. Garvey noted that the memorial resolutions had been provided to all members (revised agenda). She asked that the House of Delegates pause a few minutes to honor Raymond M. Atkins, M.D., a former Med Chi president, and Joseph Harrison III, Med Chi's former director of finance. Dr. Garvey also requested that the House of Delegates dispense with the reading of the memorial resolutions. The motion was seconded and approved. The memorial resolutions, as distributed to House of Delegates members, were as follows:

Daniel G. Anderson, M.D.
1931-1992

Whereas Daniel G. Anderson, M.D., born in Pittsburgh, Pennsylvania, in 1931, received his medical degree from the University of Maryland School of Medicine, and served as chief resident in pediatrics at the University of Virginia in Charlottesville; and

Whereas he practiced pediatrics in Salisbury for more than 30 years; and

Whereas Dr. Anderson then served, with dedication and skill his many young patients, from birth through childhood, watching them grow and healing their pains; and

Whereas he served as an active member of the Wicomico County Medical Society; and

Whereas he has long been a member of the Medical and Chirurgical Faculty of Maryland; and

Whereas he will be long remembered for his ready laughter and good humor, and particularly for his service to his church and to his God; and

Whereas his untimely death has left a void in the lives of his family, friends, patients, and colleagues; and

Whereas the Wicomico County Medical Society and the Medical and Chirurgical Faculty of Maryland express their sympathy to his family: Now, therefore be it

Resolved, That this resolution be spread upon the minutes of the House of Delegates at its annual meeting, with a copy sent to his wife, Mrs. Margaret Anderson.

Jose Ardaiz, M.D.
1927-1993

Whereas Jose Ardaiz, M.D., an internist, a member of the Baltimore County Medical Association and the Medical and Chirurgical Faculty of Maryland, and beloved husband of Sheila O'Shea Ardaiz, and father of Patrick Jose, who was killed while serving in the United States Navy in Bosnia in March 1993, Michael Jose, a third year medical student at the George Washington Medical School, and Sean Pablo, who served in the US Marines and is awaiting acceptance to medical school, died on February 5, 1993; and

Whereas Jose Ardaiz, M.D., a graduate of the University of Zaragoza in Spain, where he also received a doctorate in pharmacology, rheumatology, and cardiology, and worked in cardiology research at Indiana University; and

Whereas Jose Ardaiz, M.D., had a fellowship at Sinai Hospital and later joined a group practice, taking over the practice at a later time; and

Whereas Jose Ardaiz, M.D., was an old-fashioned, moral, and upright physician who still made house calls, would not charge patients, was always in the pursuit of perfection, and was competent and caring; and

Whereas Jose Ardaiz, M.D., loved his children, wife, practice, and religion and enjoyed music and art: Therefore be it

Resolved, That this House of Delegates of the Medical and Chirurgical Faculty of Maryland adopts this resolution as an expression of sympathy to his family; and be it further

Resolved, That this resolution be spread upon the minutes of the House of Delegates meeting and a copy sent to the Ardaiz family in recognition of the high regard in which he was held by his family, patients, and peers.

Raymond M. Atkins, M.D.
1927-1992

Whereas Raymond M. Atkins, M.D., a general and vascular surgeon, past president of the Baltimore City Medical Society and the Medical and Chirurgical Faculty of Maryland, alternate delegate to the American Medical Association, and beloved husband, father, and grandfather, died on November 11, 1992; and

Whereas Raymond M. Atkins, M.D., served as a member of the Maryland National Guard and the US Army Reserve in which he held the rank of colonel and received the Legion of Merit; and

Whereas Raymond M. Atkins, M.D., was instrumental in having the medical staffs of the former North Charles General Hospital and the Homewood Hospital endow annual scholarships through the Baltimore City Medical Society Foundation, Inc., for Maryland medical school students attending the Johns Hopkins University School of Medicine or the University of Maryland medical school, and

Whereas Raymond M. Atkins, M.D., was an active and supportive member of the Baltimore City Medical Society and the Medical and Chirurgical Faculty for over 30 years, serving on numerous committees and in several offices before becoming president of both organizations; and

Whereas Raymond M. Atkins, M.D., long will be remembered for his many services to his patients, his profession, and his community: Therefore be it

Resolved, That this House of Delegates of the Medical and Chirurgical Faculty of Maryland adopts this resolution as an expression of profound sorrow on the loss of Raymond M. Atkins, M.D.; and be it further

Resolved, That this resolution be spread upon the minutes of the meeting and a copy sent to the Atkins family in recognition of the high esteem in which Raymond M. Atkins, M.D., was held and will be remembered.

Nestor F. deVenecia, M.D.
1926-1992

Whereas Nestor F. deVenecia, M.D., was born February 25, 1926, in Dagupan City, the Philippines, and was educated at the University of Philippines College of Liberal Arts and the College of Medicine, receiving his medical degree in 1950; and

Whereas Dr. deVenecia came to the United States in 1950 having been accepted as the first Filipino in the anesthesia program at Duke University; and

Whereas Dr. deVenecia then entered the Duke University Surgery Training Program in 1952, where again he was the first Filipino to be accepted into the program, and was then accepted as the first Filipino resident in the University of Maryland Hospital in Baltimore; and

Whereas Dr. deVenecia then migrated to St. Louis to serve as acting chief of anesthesia at the Veterans Administration Hospital, and who then returned to Georgetown University to serve as a cardiovascular fellow in preparation for a surgical position awaiting him at his father's hospital in the Phillipines in 1968; and

Whereas Dr. deVenecia returned to this area then to help establish the emergency room practice at Prince George's Hospital Center and eventually moved to Columbia to set up his own practice in 1978; and

Whereas he applied for and became a member of the Howard County Medical Society and the Medical and Chirurgical Faculty of Maryland, became an active staff member at Howard County General Hospital, and maintained active memberships in the American College of Family Physicians, the American Geriatric Society, the American College of Surgeons, and the American College of Chest Physicians; and

Whereas Dr. deVenecia was most importantly regarded as "a gentleman for all seasons," respected and loved by his patients, never said a disparaging word to another man and held his family in highest regard with love and price: Therefore be it

Resolved, That this House of Delegates of the Medical and Chirurgical Faculty on April 30, 1993, adopts this resolution with a spirit of profound sorrow on the death of Dr. deVenecia; and be it further

Resolved, That this very resolution be contained within the minutes of this meeting and honorably sent to his wife Eleanor, his sons, Nestor Lawrence and Ronald Kent, and his daughter Brenda Aileen, and have copies available for his surviving siblings, Drs. Josefina Fernandez Rosita deVenecia and Virginia Laza, in recognition of the high esteem in which Dr. deVenecia will be remembered.

Joseph J. Harrison III
1929-1993

Whereas Joseph J. Harrison III, devoted husband of Marie Harrison, died suddenly on January 16, 1993, at the age of 63; and

Whereas Joe and Marie were blessed with five wonderful children: Teresa, Joseph IV, Joan, Thomas, and Mary, and six grandchildren; and

Whereas Joe began working at the Medical and Chirurgical Faculty of Maryland in August of 1963; and

Whereas Joe served as associate executive director of Med Chi, director of the Med Chi Insurance Fund, secretary and treasurer of the Med Chi Agency, and treasurer of the Maryland Medical Political Action Committee; and

Whereas Joe was instrumental in the creation of the Med Chi Agency; and

Whereas Joe was committed to protecting Med Chi funds; and

Whereas Joe was a friend of many—member physicians and fellow workers—and will be missed: Therefore be it

Resolved, That this resolution be included in the minutes of this meeting and a copy sent to Joe Harrison III's wife and family in recognition of the high regard in which Joe was held by the physicians of Maryland, his fellow workers, and friends.

◆ *Award presentations*

a. 50-Year certificates. The chairperson read the list of 50-year members as follows:

Baltimore City

Eugene S. Bereston, M.D.
Charles N. Davidson, M.D.
John H. Hirschfeld, M.D.
L. Harrell Pierce, M.D.
Leland B. Stevens, M.D.
Alice B. Tobler, M.D.

Baltimore County

John C. Baier, M.D.
W. Drummond Eaton, M.D.

Affiliates

Alfred B. Dixon, M.D.

John H. Hirschfield, M.D., and L. Harrell Pierce, M.D., from Baltimore City, were present and accepted their 50-year certificates.

b. AMA-ERF awards. The chairperson noted that contributions to the AMA-ERF (American Medical Association Education and Research Foundation) fund in 1992 totaled more than $35,000, of which more than $22,000 was contributed by Med Chi members. AMA-ERF checks were presented to the three medical schools by Elizabeth Linhardt, chairperson of the Maryland AMA-ERF fund; Myrna Goodman, president of the Med Chi Auxiliary; and Mildred Taylor, president-elect of the Southern Medical Association Auxiliary.

Roland Smoot, M.D., accepted the AMA-ERF checks on behalf of the Johns Hopkins medical school. The school was given a check for more than $7,300 in unrestricted funds and a check for $5,600 in restricted funds for the medical student assistance program. Dr. Smoot noted that he accepted the funds on behalf of Dean Johns with gratitude; noting that the medical students were of primary interest to the medical school.

Patricia Digiannantonio, deputy general counsel of the Henry Jackson Foundation of the Uniformed Services University of the Health Sciences, accepted the two checks presented to that school. Ms. Digiannantonio thanked the auxiliary for the support.

Gregory Handlin, associate dean of the University of Maryland School of Medicine, accepted the checks on behalf of the school. The school was presented with a check for $15,000 in unrestricted funds and a check for $7,300 in restricted funds. Mr. Handlin noted that with the recent budget cuts, the money would be very helpful to medical students at the University of Maryland School of Medicine.

c. Wyeth-Ayerst Laboratories Physician Award for Community Service. John O. Meyerhoff, M.D. (Baltimore City), was presented with the Wyeth-Ayerst Laboratories Physician Award for Community Service by the chairperson and Mohammed Saleem, a representative from the A.H. Robins Sales Division for Wyeth-Ayerst Laboratories. The secretary noted that Dr. Meyerhoff, who has worked closely with Parents Anonymous of Maryland, had thought that services should be directed to the children themselves, many of whom were victims of abuse and neglect. Because of his efforts, many young troubled adolescents are now receiving the services they need at 20 Baltimore City and Baltimore County schools.

d. Award for excellence in medicine. The chairperson presented the award for excellence in medicine to Jeffrey Jonathan Wise from the University of Maryland. The secretary noted that Mr. Wise had revitalized the chapter of the AMA Medical Student Section at the University of Maryland, recruiting over 200 members. He had attended national and regional AMA meetings and had organized blood pressure screenings and organ donation drives. Upon receiving his award, Mr. Wise said he hoped that in his absence the AMA Medical Student Section at the University of Maryland would continue to grow.

e. Certificates of recognition to committee chairpersons. The chairperson presented certificates of recognition to the following four physicians for their outstanding service and dedication as chairpersons of Med Chi committees:

- ✧ *Harrold T. Elberfeld, M.D.,* Maternal Welfare Subcommittee
- ✧ *Paul A. Stagg, M.D.,* Ad Hoc Proactive Committee on Self-Referral
- ✧ *John G. Bartlett, M.D.,* Ad Hoc Review Committee on Physicians with Bloodborne Pathogens
- ✧ *Ronald Fishbein, M.D.,* Library and History Committee and Ad Hoc Bicentennial Committee

The chairperson thanked each of the recipients for their ongoing dedication to Med Chi endeavors. Dr. Elberfeld (Baltimore County) noted that thanks should go to the hardworking members of his committee and to the committee's staffperson, Rose M. Matricciani, R.N., J.D., chief operating officer.

f. Photo contest. The first place winner of the Med Chi 12th annual photo contest was Dr. Jerrold M. Post, and the second place winner was Mrs. Morrell L. Williams. Mrs. Williams was present and was recognized by the House of Delegates.

◆ Board of Physician Quality Assurance

Israel H. Weiner, M.D., chairperson, Board of Physician Quality Assurance (BPQA), presented the BPQA report. Dr. Weiner noted that 1992 was the fourth full year of BPQA, and that significant progress had been made during this year. Highlights of the information presented are as follows:

- ✧ In 1990, BPQA had 61 major actions; it was ranked 48th out of 50 states;
- ✧ In 1991, BPQA had 73 major actions; it was ranked 42nd out of 50 states, which also earned BPQA a first-page announcement in *USA Today* and the *Washington Post* as one of the 10 worst medical boards in the country;
- ✧ In 1992, BPQA had 113 major actions; it was ranked 17th out of 50 states.

Dr. Weiner stated that he thought BPQA's successes have been related directly to the fact that BPQA became independently budgeted in 1991. Although the licensing fee had been raised from $50 to $450, BPQA receives only about $250 of that amount. Part of the monies go to the state's general fund, $50 goes to Med Chi for physician rehabilitation and peer review programs, and part covers the cost of BPQA overhead.

Because it is very selective in what is processed, BPQA only lost two cases last year. Dr. Weiner noted that BPQA was updating its computer system. He noted, however, that the process has been moving very slowly; it took over a year just to obtain a consultant report.

Dr. Weiner noted that although, in the past, BPQA received complaints about its slowness in processing cases, over 89% of 2,000 complaints were resolved within 12 weeks last year. The remaining 11% were complicated cases that went to peer review or were referred for other types of investigations. Dr. Weiner further stated that BPQA opened 837 cases for investigation and 179 formal cases were opened. He remarked that BPQA has been chastised in the past for the number of cases over a year old. In 1989, there were 1,312 open cases; 513 were over a year old. Last year, there were 285 open cases, and only 67 were over a year old. Cases are being resolved much more quickly.

BPQA, as of April 1993, started publishing a newsletter that it hopes to continue publishing on a quarterly basis, eventually increasing publication to a bimonthly basis.

Dr. Weiner explained that BPQA has also been trying to improve the physician license renewal system. The application is now much simpler and shorter, requiring only one signature versus the three needed previously. BPQA is planning to initiate a rolling renewal whereby physicians will renew their license on their birthday, which should allow BPQA to handle problems more quickly.

Dr. Weiner noted that Maryland's peer review process is used nationally as a model. He asserted that through Med Chi, BPQA obtains a wide variety of expert reviewers who can cover all specialties and subspecialties in a short period of time; these reviewers can be objective, fair, and disinterested in their evaluation of another physician. In comparing the state's peer review process with that of the PRO (professional review organization), Dr. Weiner noted that Maryland's process is fairer to physicians and more accurate.

Dr. Weiner concluded by stating that BPQA's accomplishments were a direct result of the outstanding job Med Chi has done in the past two years in the peer review process. He noted that Ronald Cohen, M.D., chairperson of the Peer Review Management Committee, has been a "class act" in managing peer review and improving it. Dr. Weiner thought that Dr. Cohen and Steve Johnson, J.D., director of peer review at Med Chi, were two of the most sophisticated peer review theorists in the country. The chairperson thanked Dr. Weiner for his report.

◆ Council's report

a. Chairperson's report. Joseph S. Fastow, M.D., chairperson of Council, noted that the preceding year had been a difficult and controversial year for Council, for Med Chi, and for medicine. He noted that Council made three strategic decisions during the year.

The legal/lobbying representation for Med Chi was one of the first decisions. Dr. Fastow went on to say that the Executive Committee had concluded that Med Chi should be represented by an independent in-house counsel separate from the lobbying firm. As a result, Angus Everton, J.D., was hired.

Subsequent to Mr. Everton's hiring, the issue of lobbying had been discussed. It was determined that there was no justification for the enormous number of dollars being spent for lobbying, and other lobbying arrangements were explored. Dr.

Fastow stated that at that point, the Med Chi lobbyist resigned. Faced with a legislative session only six weeks away and without any legislative files from the previous lobbying firm, it was necessary to hire a lobbyist quickly. Marvin Mandel, J.D., was hired as the Med Chi lobbyist on short notice because of his resources, contacts, and absence of interest in representing others in the health care system. Dr. Fastow asserted that Mr. Mandel had been indispensable to Med Chi. His ability to open doors, to get points across, and to influence legislators was unparalleled. Dr. Fastow noted that Mr. Mandel was the person in the background intervening for Med Chi.

Dr. Fastow explained that some legislation Med Chi faced—RAPs (radiologist, anesthesiologists, and pathologists) legislation, legislation to put all physicians under the Health Systems Cost Review Commission (HSCRC), a physician rehabilitation bill, and the radiology technologist bill—was defeated. Dr. Fastow said that Med Chi had been warned that its ex-lobbyist was "out to get Med Chi" in Annapolis. Dr. Fastow thought that this confirmed that Med Chi had made the right decision in seeking an independent lobbyist and having an Annapolis office open year-round to interact with legislators.

Dr. Fastow also mentioned HB 1359, which he noted left Med Chi faced with decisions that had to be made rapidly. When the final legislation was reviewed, Med Chi had only one day to make a decision. After consultation with the lobbyist, the Executive Committee thought that if Med Chi opposed the bill, Med Chi would have been doing itself a disservice by facing a hostile legislature next year. Dr. Fastow noted the importance of health care decisions being made in Annapolis, not in Washington, DC, for Maryland physicians.

He concluded his legislative comments by recognizing what was mentioned earlier by Delegates Alexander and Taylor at the afternoon meeting on health legislation, that HB 1359 is a beginning. Dr. Fastow went on to say that just as "just say no" did not work for drugs, "just say no" is not going to work on health system reform either. Subsequent legislation will have a great deal to do with modifying HB 1359. Dr. Fastow said that Med Chi was ready in Annapolis to work on health care legislation. The challenges next year will be different than this past year because there will be more challenging issues. Med Chi will need to use its expertise to make its case.

Dr. Fastow thought that political manipulation of the Maryland General Assembly was replaced with technical expertise and a strong physician presence on both sides of the Maryland General Assembly. Dr. Fastow said that Med Chi would be actively involved in the selection process for members to the Health Care Access and Cost Commission (HCACC).

Dr. Fastow noted he was the last Council chairperson who would also act as chairperson of the Executive Committee. Dr. Fastow mentioned that the bylaw changes to expand the Executive Committee from 7 to 11 members and to change the Executive Committee chairperson from the Council chairperson to the Med Chi president were fundamental changes in the way Med Chi has operated. After serving in both positions, he believed more than ever that the two should be separated. Dr. Fastow noted that he believes strongly in Council, as it is the place Med Chi members come together to argue issues, build consensus, and air views. He noted that there had been over 90% attendance at Council meetings over the last two years. He concluded by stating that it had been a great honor to serve Med Chi and thanked the House of Delegates.

b. Emeritus membership. The chairperson stated that if there were no objections, the House of Delegates would dispense with the reading of the emeritus member list, since the names had been published in the agenda as follows:

Anne Arundel County
- Kurt R. Fiedler, M.D.
- Roy V. Land, M.D.
- William C. Weintraub, M.D.

Baltimore City
- Albert M. Antiltz, M.D.
- Donald M. Barrick, M.D.
- Ralph K. Brooks, M.D.
- William P. Horton, M.D.
- Henry E. Langenfelder, M.D.
- Lyle J. Millan, M.D.
- Kurt Raab, M.D.
- Richard D. Richards, M.D.
- Gerald L. Russo, M.D.
- Gerhard Schmeisser Jr., M.D.
- Carlton L. Sexton, M.D.
- Aytekin Ulgen, M.D.

Baltimore County
- Danilo R. Coronel, M.D.
- Morton J. Ellin, M.D.
- Frank T. Kasik, Jr., M.D.
- Melvin D. Kopilnick, M.D.
- Henrietta Moritz, M.D.
- William F. Rienhoff, M.D.
- Stanley B. Rosendorf, M.D.
- Mehdi L. Yeganeh, M.D.
- H. Margaret Zassenhaus, M.D.

Carroll County
- Octavio A. Ruiz, M.D.

Garrett County
- Gordon H. Earles, M.D.

Harford County
- John A. Carriere, M.D.

Kent County
- John G. Morani, M.D.

Montgomery County
J. F. Barr, M.D.
Edward A. Beeman, M.D.
Donald L. Burnham, M.D.
Ronald R. Cameron, M.D.
Donald E. Dillon, M.D.
Lennard G. Gold, M.D.
Philip A. Kapp, M.D.
Sydney Leventhal, M.D.
Frank Mate, M.D.
James P. McCarrick, M.D.
Jay W. McRoberts, M.D.
George I. Mishtowt, M.D.
Jose M. Molina, M.D.
Murray Paul, M.D.
Peter D. Protos, M.D.
Theresa G. Reed, M.D.
Laurence E. Rubin, M.D.
Alan W. Winshel, M.D.
Prince George's County
Emedita E. Quintos, M.D.
Arthur Shaver, M.D.
Dimitri Zafiropulos, M.D.
Wicomico County
Elias S. Adamopoulos, M.D.
Orlando A. Balea, M.D.
Oliver J. Thoms, M.D.
Affiliates
Richard H. Doss, M.D.
Joseph J. Noya, M.D.

◆ Waiver of dues

The following members were granted a waiver of dues:
Baltimore City
Jerel I. Katz, M.D.
Patricia A. McIntyre, M.D.
Baltimore County
Nathan L. Centers, M.D.
Franklin D. Israel, M.D.
Govind Madhiraju, M.D.
Harford County
Gunther D. Hirsch, M.D.

◆ Reference Committee report

The chairperson noted that the House of Delegates had been mailed the resolution submitted by the Baltimore County Medical Association. A public hearing was held on March 9, 1993. Murray A. Kalish, M.D. (Baltimore City), chairperson of the Reference Committee, presented the committee's report. Dr. Kalish stated that the resolution was a goodwill resolution. It was the consensus of the committee, however, that the resolution's wording would require Med Chi's daily operations to go through the entire Executive Committee. The committee members thought that since Med Chi's daily operations were within the executive director's purview, approval of the resolution would cause gridlock and inaction. Therefore, it was the unanimous opinion of the Reference Committee members that the resolution should be rejected in its entirety.

The chairperson related that the House of Delegates could either accept the Reference Committee's recommendation, reject its recommendation, or refer the resolution back to the Reference Committee with directions. The House of Delegates accepted the Reference Committee's report and defeated the resolution.

◆ Bylaws report

The chairperson noted that members of the House of Delegates had been mailed a copy of the bylaws report. Alex Azar, M.D. (Wicomico County), chairperson of the Bylaws Committee, presented the Bylaws Committee report. The chairperson asked Dr. Azar to present the committee's report using the consent calendar procedure. Dr. Azar noted that the Bylaws Committee included Karl H. Weaver, M.D. (Baltimore City); Thomas E. Allen, M.D. (Baltimore County); Barton J. Gershen, M.D. (Montgomery County); Reynaldo L. Lee-Llacer, M.D. (Prince George's County); Michael J. Dodd, M.D. (southern Maryland); and J. Ramsay Farah, M.D. (western Maryland).

Items not extracted. After Dr. Azar presented the committee report, items 2, 4, and 7 were extracted for later discussion and individual vote. The chairperson then asked for a vote to adopt items 1, 3, 5, 6, and 8. Those items were as follows:

1. Proposed bylaw amendment to Article VII—Council, Section 2, (10). Amend article as follows ([Brackets] indicate deletion, and CAPS indicate change.):

> **Section 2.** The Council shall have all power and authority over the affairs of the House of Delegates, except that of modifying any action taken by the House of Delegates, and shall have power to: (1) issue charters to component societies; (2) recommend assessments; (3) remit a member's dues or assessment; (4) approve the budget; (5) appoint one or more assistant secretaries or assistant treasurers; (6) fill vacancies among the elective officers and those appointed by it; (7) fix the date and place of general meetings; (8) appoint an editor of the *Maryland Medical Journal* for a term of three years or until his or her successor is appointed; (9) set the amount of bond on the treasurer, the premium to be paid by the Faculty; AND (10) [retain counsel to the Faculty for a one-year period; and (11)] select independent certified accountants to audit the treasurer's accounts and report to the annual session of the House of Delegates.

3. Proposed bylaw amendment to Article XI—Committees, Section 22. Amend article as follows ([Brackets] indicate deletion, and CAPS indicate change.):

> [**Section 22.** A Medical Committee shall join with the corresponding committee of the Maryland State Bar Association, composed of an

equal number of members, for the consideration of problems common to, or of concern to, both the medical and legal professions. Its chairperson and members shall be appointed by the president. The tenure of office for this committee shall be one year and shall commence at a time that is mutually agreeable with the Maryland State Bar Association, so as to ensure that individual members shall serve conjointly with their respective counterpart members.]

5. Proposed bylaw amendment to Article XII—Physician's Defense. Amend article as follows ([Brackets] indicate deletion.):

Section 2. A panel may be convened to generally discuss the member's case and may make recommendations and give opinions regarding it. [General counsel for the Faculty shall be available for consultation purposes as an incident to Physician's Defense.]

6. Proposed bylaw adjustment to Article III—Finance, and to Article I—Component Societies. Move Article III, Section 1, to Article I, Section 7. The section reads as follows:

Section 1. On or before January 31 each year, the secretary of each component society shall forward to the secretary of the Faculty (1) a list of the component societies' officers and (2) a list of the delegates and alternates to the House of Delegates.

8. Proposed bylaw amendment to Article VII—Council, **Section 6.** The section reads as follows ([Brackets] indicate deletion, and CAPS indicate change.):

The Council shall employ under contract [an executive director] A CHIEF EXECUTIVE OFFICER who shall report and be responsible to the Council....

All of the non-extracted items (1, 3, 5, 6, and 8) were approved.

Items extracted. The chairperson then asked Dr. Azar to read each extracted item for discussion.

2. Proposed bylaw amendment to Article VII—Council, Section 6. Amend article as follows ([Brackets] indicate deletion, and CAPS indicate change.):

Section 6. The Council shall employ under contract an executive director who shall report and be responsible to the Council. He/she shall be the executive and general manager of the affairs of the Faculty and have authority to employ, discharge, and fix the compensation of personnel [in accordance with the provisions of the personnel policies established by the Council].

Louis C. Breschi, M.D. (Baltimore County), noted that Baltimore County would like to amend this item by substituting in place of "Council," "Executive Committee," because in the past, the Executive Committee had employed the executive director. John H. Hebb, M.D. (Baltimore County), inquired whether a personnel policy was in place at Med Chi. Angelo J. Troisi, FACHE, executive director, stated it was. Albert L. Blumberg, M.D. (Baltimore County), noted that the Executive Committee is no longer an Executive Committee of Council, but an Executive Committee of the Faculty. Dr. Blumberg noted that the Executive Committee had approved Mr. Troisi's contract.

Mayer C. Liebman, M.D. (Baltimore County), asked why the Bylaws Committee had suggested that the phrase "in accordance with the provisions of the personnel policies established by the Council" be deleted from this section. Dr. Azar explained that many personnel policies were set by both federal and state regulations; therefore, Council would not be able to establish personnel policies. He explained that Med Chi personnel policies are established by the Personnel Department according to federal and state statutes as they are in other corporations. The policies are then reviewed by the general counsel and the chief operating officer before being submitted to the executive director. Dr. Azar also noted that the proposed change would be micromanagement, and Council had voted previously to do away with micromanagement.

Dr. Liebman spoke against the amendment; he thought that the executive director should be responsible to Council. Joseph S. Fastow, M.D. (Calvert County), spoke against Baltimore County's amendment. Dr. Fastow noted that Council had asked the Executive Committee to finalize Mr. Troisi's contract. Dr. Fastow could not understand why Mr. Troisi's contract had not been finalized previously. Dr. Blumberg noted that Mr. Troisi's contract had been approved in 1989. Dr. Blumberg inquired where the decision to extend Mr. Troisi's contract had occurred, since if his contract started in 1989, the five years would have ended in 1994. Dr. Fastow noted that the contract goes into effect when it is signed, and it was not signed until 1993.

Carol W. Garvey, M.D. (Montgomery County), asked for a point of clarification. She noted that the amendment dealt with Council, and Council had two different positions in the amendment: the executive director should be responsible to Council as the current bylaw is written; and "in accordance with personnel policies established by the Council." Dr. Garvey noted that the latter statement was an inaccurate provision, and the House of Delegates was being asked to delete an obsolete and inaccurate provision. She noted that personnel policies were established by Med Chi, not by Council, but in fact, the executive director has been and will be responsible to Council. This does not mean micromanagement; it means being responsible. Mr. Everton, acting as parliamentarian, ruled the suggested change substantive in nature and, therefore, inappropriate.

J. David Nagel, M.D. (Baltimore County), made a motion to refer the amendment back to the Bylaws Committee. Paul A. Stagg, M.D. (Dorchester County), spoke against the motion. He noted that the matter at hand was whether the executive director would have the authority to deal with Med Chi personnel policies. Dr. Nagel noted that to refer back is not debatable. Dr. Garvey asked for a point of clarification. She asked whether the entire resolution, not just the amendment was to be referred back to the Bylaws Committee. Dr. Azar thought that Dr. Nagel was incorrect because the bylaws

information was mailed out in a timely manner—at least 30 days prior to today's meeting—and everyone had had time to review the information.

The chairperson noted that a motion was on the floor to refer the amendment back to the Bylaws Committee. Joseph Snyder, M.D. (Montgomery County), president-elect, noted that a motion to refer is debatable. There again was a question about what was being referred. It was noted that the amendment should be dealt with separately. A ruling from the acting parliamentarian was requested.

Mr. Everton said that the amendment was not before the body at all, and the question was whether item 2 should be referred back to the Bylaws Committee. If it were referred back, it could be reconsidered and the amendment could be added. He noted that a vote against referral would mean that the information would have to be addressed today. The House of Delegates voted to refer the bylaws amendment back to the Bylaws Committee.

4. Proposed bylaw amendment to Article XI—Committees, Section 44. Amend article as follows (CAPS indicate change):

> **SECTION 44.** A SELF-REFERRAL COMMITTEE OF AT LEAST NINE MEMBERS SHALL BE APPOINTED BY THE PRESIDENT WHO SHALL ALSO APPOINT THE CHAIRPERSON. THE COMMITTEE SHALL USE THE AMA'S COUNCIL ON ETHICAL AND JUDICIAL AFFAIRS' GUIDELINES ON SELF-REFERRAL TO REVIEW AND ANALYZE SPECIFIC SITUATIONS. THE COMMITTEE SHALL BE AUTHORIZED TO RECEIVE INQUIRIES FROM PHYSICIANS REQUESTING WHETHER AN ARRANGEMENT MEETS THE AMA GUIDELINES. THE COMMITTEE MAY REVIEW AS NECESSARY ANY COMPLAINTS WHEREIN THERE IS AN ALLEGATION OF INAPPROPRIATE PHYSICIAN SELF-REFERRAL. THE COMMITTEE SHALL DETERMINE THE MECHANISM FOR CONDUCTING ITS BUSINESS AND THE MANNER BY WHICH SELF-REFERRAL SITUATIONS MAY BE REFERRED TO THE COMMITTEE.

Samuel I. O'Mansky, M.D. (Baltimore City), noted that Baltimore City opposed the creation of a standing committee on self-referral because the amendment was proposed before the state legislature passed legislation prohibiting self-referral. He stated the committee would have no power, would be an added Med Chi expense, and would accomplish nothing. An ad hoc committee could be created at a later date if it became necessary. Jose Martinez, M.D. (Baltimore County), stated he was speaking on behalf of himself. He supported the formation of a self-referral committee, but suggested the following changes to the wording of the amendment. On line 15, strike the word "utilize" and substitute the word "consider"; on line 16, strike the word "to" and replace it with "in its"; on line 17 strike the word "analyze" and substitute "analysis of"; and on line 19, strike the "AMA" and replace it with "the Committee's." He also suggested another change to the amendment as follows: "The committee should recommend to Med Chi proposed legislative activities based on its studies of legislation or regulations dealing with self-referral." Dr. Martinez moved, since he was suggesting substantive changes, that the amendment be referred back to the Bylaws Committee. The motion was seconded.

Paul A. Stagg, M.D., noted that he was opposed to the motion to refer. If the motion were defeated, he wanted to return to explain why he thought the motion should not be referred.

J. David Nagel, M.D., noted that previously when a bylaws change was suggested, the Baltimore City Medical Society had instructed the Bylaws Committee on amendments to be brought to the House of Delegates. Therefore, Dr. Nagel wondered why these changes, if they were referred by the House of Delegates, were being referred back to the Bylaws Committee. He noted that he would speak against referral. Dr. Azar noted that the bylaw amendment being discussed was referred by Council to the Bylaws Committee. Dr. Martinez noted that his amendments were not "House" amendments, but were "personal" amendments.

Carol W. Garvey, M.D., spoke against the motion to refer because she thought it was appropriate to deal with the issue now since the self-referral law would not restrict self-referral for the next three years.

Dr. Nagel asked the House of Delegates to allow J. Ramsay Farah, M.D. (Washington County), who was not a delegate, to speak. Since there was no objection, Dr. Farah addressed the House of Delegates. He noted that the present legislation set the pace on self-referral; it was not a dead issue. He explained that self-referral will occur, and the study that will be undertaken regarding this issue will need to be evaluated, and recommendations will have to formulated by Med Chi. If Med Chi does have a standing committee on self-referral, there is the possibility that the foregone conclusion will be that all self-referral is no good, which, he noted, was against AMA policy. He recommended that the House of Delegates establish a self-referral committee that would monitor, evaluate, and help Med Chi to do the necessary studies. He stated that Med Chi's recommendations on this issue do follow its policies.

Dr. Martinez requested to withdraw his motion to refer. Dr. Yosuico noted that since the motion was on the floor, it could not be withdrawn since it had been debated. The chairperson called the question on referring the recommendation back to the Bylaws Committee. The motion was not referred back to the Bylaws Committee.

The chairperson noted that there was a motion on the floor. The motion was to approve or not approve the amendment as mailed to the members of the House of Delegates.

Dr. Stagg noted that he had the honor to be chairperson of the Ad Hoc Committee on Self-Referral, which had been created to study self-referral. While he understood why there might be a question about what a standing committee on self-referral might do since there was now legislation on

the issue, the law had only been passed but not implemented, and the law calls for a study, which should have input from organized medicine. Dr. Stagg recognized that the legislature had inquired during testimony on the self-referral bill what Med Chi had done. Med Chi's answer was limited to stating that a committee that had made recommendations had been formed. The legislature thought Med Chi did not have substantial enough information to determine the issue. Dr. Stagg thought that if Med Chi had had a standing committee in place, with its own criteria and specific information to present, the legislature would have been satisfied. Additionally, Dr. Stagg thought that with the present self-referral legislation in place, there will be a need for review of the issue in the future. A standing committee could easily offer its services to the BPQA or to whatever organization will be implementing the legislation. In conclusion, Dr. Stagg thought it would be beneficial for Med Chi to have a standing self-referral committee, and he did not think it would be costly.

Gary L. Rosenberg, M.D. (Baltimore City), remarked that the bylaws for the proposed self-referral committee were so narrowly drawn that if the House of Delegates approved a standing committee, it would not be able to study the self-referral report because the report would not be within its purview. Dr. Rosenberg thought the bylaws as presented only set up a review mechanism, and further bylaw changes would be needed to increase the responsibility of a self-referral committee.

Dr. Martinez again presented the above-mentioned amendments to enlarge the jurisdiction of the proposed self-referral committee. Dr. Martinez also stated that he had served on the ad hoc committee and thought that a standing self-referral committee should be created.

The chairperson noted that this was an amendment. The amendment was seconded. At this point, Dr. Azar noted that several members of the audience thought that change was substantial and that a ruling of the chairperson was needed. The chairperson ruled that the changes were substantial. Dr. Rosenberg challenged the ruling. The House of Delegates did not agree with the chairperosn.

Margaret T. Snow, M.D. (Montgomery County), asserted that Dr. Martinez was only trying to improve the language of the bylaws, allowing the committee to have more freedom from the AMA, which Dr. Snow thought was proper. Dr. Azar said, speaking as chairperson of the Bylaws Committee, that he did not have objections to the recommended changes and did not think the members of the Bylaws Committee would either.

The chairperson called the motion: the amendments presented by Dr. Martinez. The House of Delegates voted in favor of the amendments.

The amended bylaw was then presented for vote. The amended bylaw was approved by the House of Delegates.

7. Proposed bylaw amendment to Article VIII—Executive Committee, Section 2. Amend article as follows ([Brackets] indicate deletion, and CAPS indicate change.):

> **Section 2.** The Executive Committee shall act in an advisory capacity to the officers and staff in questions of immediate importance in the interim between meetings of the Council [and], shall perform such other duties as the Council may from time to time deem expedient AND APPROVE THE LOBBYIST SELECTED TO REPRESENT THE FACULTY AT THE MARYLAND GENERAL ASSEMBLY FOR A ONE-YEAR PERIOD.

Carol L. Bender, M.D. (Montgomery County), asked for clarification of the issues. She vocalized that too much time was being spent discussing issues and "going out to left field." Dr. Yosuico said that although he agreed, he had to allow anyone who wished to speak to do so.

Marion Friedman, M.D. (Baltimore City), said that the Baltimore City Medical Society was against the proposed amendment because it was a form of micromanagement. He contended that the executive director was responsible for hiring employees and should be held responsible by the membership. If members had no faith in him, they should not continue his employment. Dr. Friedman noted that a lobbyist has not always been a part of Med Chi. He thought a lobbyist from the outside was a temporary measure. The way the amendment was worded suggested that Med Chi would have a lobbyist every year.

Thomas E. Allen, M.D. (Baltimore County), noted that Council had voted to allow the Executive Committee to approve the hiring of the lobbyist. As a member of the Bylaws Committee, he was of the opinion that Dr. Azar had been a fair and reasonable chairperson. He noted that the amendment was approved unanimously by the Bylaws Committee. The amendment protected the executive director by having the choice ratified by the Executive Committee.

Howard L. Siegel, M.D. (Montgomery County), announced that physicians need to become more involved in the political process. He thought it was important for Council to consider the choice of a lobbyist and, therefore, spoke against the amendment.

Donald S. Stepita, M.D. (Montgomery County), suggested the motion be voted down. He reminded the House of Delegates that there had been a highly contested appointment of an outside lobbyist during the last session and thought that if the entire Council had the opportunity to discuss the hiring of a lobbyist, it would avoid the problems presented previously. Dr. Stepita thought the motion should be voted back so that it could be added to Article VII, Section 2.

Dr. Martinez recommended, as an individual, to oppose the amendment. He thought it was not in Med Chi's interest to limit a lobbyist's term because continuity was needed in dealing with the legislature.

Frederick J. Hatem, M.D. (Harford County), spoke in favor of the amendment. He thought it would be a waste of time to

have a lobbyist submit his application to Council. It would cause Med Chi difficulty in obtaining a lobbyist of any renown. In answer to the questions raised by Baltimore County, Dr. Hatem made a motion to amend the bylaws as follows: on line 19, after "expedient," add "including approving a lobbyist if one is selected to represent the Faculty at the Maryland General Assembly" and remove "for a one-year period." The motion was seconded.

Dr. Allen thought the motion would be acceptable to Baltimore County. Dr. Azar stated it was acceptable to the Bylaws Committee. Dr. Martinez spoke against the amendment because he thought that included in the duty to approve was the power to veto.

Dr. Blumberg asked for a point of order. He noted that since the Bylaws Committee accepted the amendment, it was now considered a friendly amendment. Thus, what was now being discussed was the amended motion. The chairperson reaffirmed this.

Reynaldo L. Lee-Llacer, M.D. (Prince George's County), did not think the amendment could be accepted as a friendly amendment. Dr. Rosenberg stated that accepting the friendly amendment would mean the Executive Committee would approve an in-house lobbyist. He asserted that this violated the previous principles established that the executive director would have the discretion to hire full-time people. The language assumes there is going to be an outside lobbyist, as well as an in-house lobbyist, and Dr. Rosenberg did not think Med Chi had made such a decision.

Dr. Azar asked for a point of order. He stated that Dr. Lee-Llacer was correct, that once a motion is on the floor, it cannot be accepted as a friendly amendment. Dr. Bender called the question on the amendment. The House of Delegates approved the amendment.

Dr. Bender stated that she thought the Executive Committee should select the lobbyist. The executive director had recently received a five-year contract, and if membership is saying that they do not agree with the executive director's lobbyist choice, they should ask the executive director to resign; it could prove very costly. Therefore, as a compromise, Dr. Bender thought that the Executive Committee should make the decision.

Dr. Allen noted that referring the matter to Council was not accepted by the Bylaws Committee. If the amendment was referred back to the Bylaws Committee for consideration, the committee would not approve it. Dr. Allen thought that the amended amendment was a reasonable compromise.

The chairperson called the motion. The motion was passed as follows:

> **Section 2.** The Executive Committee shall act in an advisory capacity to the officers and staff in questions of immediate importance in the interim between meetings of Council and, shall perform such other duties as Council may from time to time deem expedient including approving the lobbyist if one is selected to represent Med Chi at the Maryland General Assembly.

◆ *Maryland Medical Political Action Committee report*

John T. Lynn, M.D. (Prince George's County), chairperson of the Maryland Medical Political Action Committee (MMPAC), noted that there had been no increase in MMPAC membership during the past year. In the past, MMPAC had won awards for increased membership. Dr. Lynn thought there were many reasons for the lack of an increase in membership:

- ✧ Increase in specialty society PACs
- ✧ Increase in PACs by larger component societies
- ✧ Increase in physician employment in health corporations, health maintenance organizations, three medical schools, and the National Institutes of Health, and a decrease in private practice assignments
- ✧ Physicians deferring to their corporations on legislative issues.

Dr. Lynn stated that strict election and antitrust laws restricted MMPAC from working with other medical PACs in the state. This situation dilutes medicine's impact; a single state PAC would be much more effective. Dr. Lynn hoped that new political issues having an impact on the medical profession will remind physicians that they are doctors first, and generalists and specialists second. He noted that members are licensed and disciplined as physicians. Physicians are patient advocates. By joining MMPAC, members would have a unified and common voice on legislative issues. He asked members to join MMPAC if they were not presently members.

◆ *Treasurer's report*

Albert L. Blumberg, M.D., treasurer, noted that in 1991, Med Chi had a budget with a projected deficit of $47,000; at the end of the year, however, there was only a $25,000 deficit. In 1992, a deficit of $49,000 was projected. Dr. Blumberg noted the audit for 1992 was being completed, and Med Chi should know shortly what the deficit was. The 1993 budget shows a $50,000 balance because money was put into reserves. Dr. Blumberg noted that there might be some additional funds in 1993 because of personnel changes.

It was his opinion that because of present legislative changes in the health care field, Med Chi would have a decrease in membership. The decrease in out-of-state members would decrease funds for Med Chi's physician rehabilitaion and peer review programs. Because of these factors, a dues increase might be needed in 1994; there has not been a dues increase since 1979. Dr. Blumberg remarked that Joseph Harrison had made Dr. Blumberg's life easier and more bearable during his two years as treasurer, and he publicly acknowledged Mr. Harrison's contributions as comptroller to Med Chi. Dr. Blumberg stated that the budget will be published this summer.

◆ Statements by Carol Bender, M.D.

Carol Bender, M.D., asked to make statements regarding the MMPAC and the treasurer's report. She wished to address the apathy of Med Chi and the decrease in membership because she thought they were related. The Montgomery County Medical Society is seeing physicians who question what the medical society is doing for them and who are dropping out. She further related that this points to the fact that there must be an urgent problem to be addressed.

◆ Nominating Committee's report

J. David Nagel, M.D., chairperson of the Nominating Committee, presented the Nominating Committee report as follows:

✧ *President-elect:*
Joseph S. Fastow, M.D.

✧ *First vice-president:*
Alex Azar, M.D.

✧ *Second vice-president:*
J. Ramsay Farah, M.D.

✧ *Third vice-president:*
Thomas E. Allen, M.D.

✧ *Secretary:*
Paul A. Stagg, M.D.

✧ *Treasurer:*
Carol W. Garvey, M.D.

✧ *Finney Fund Committee:*
Robert G. Greenfield, M.D.

✧ *Delegates to AMA:*
Donald T. Lewers, M.D.
George S. Malouf, Sr., M.D.

✧ *Alternate delegates to the AMA:*
Carol W. Garvey, M.D.
Reynaldo L. Lee-Llacer, M.D.

In addition to the above slate of officers, the Nominating Committee had reviewed the actions of Council at its January 21, 1993, meeting concerning the vacancy for the AMA alternate delegate seat and asked that the House of Delegates reaffirm the action taken to have Jose M. Yosuico, M.D., fill the vacancy created by the untimely death of Dr. Raymond Atkins for the term ending December 31, 1994. The chairperson noted that the motion was to approve the action taken during the January 21, 1993, Council meeting to have Jose M. Yosuico, M.D., fill the vacancy created by the death of Dr. Atkins. The motion was reaffirmed.

Dr. Nagel noted that the following individuals were on the ballot for the BPQA vacancies:

Frederick P. Alpern, M.D.
Ira N. Brecher, M.D. (incumbent)
Irvin H. Cohen, M.D.
Sanford H. Eisenberg, M.D.
Lawrence C. Jones, M.D. (incumbent)
Charles Kaelber, M.D.
Suryabala B. Kanhouwa, M.D.
Santosh D. Kaushal, M.D.
Kenneth R. Lippman, M.D.
Lois H. Love, M.D.
Melvin Museles, M.D.
Joseph J. Reidy, M.D.
Michael K. Spodak, M.D.
Ronald J. Taylor, M.D.

Dr. Snyder asked the number of votes each person shall cast for BPQA vacancies. The chairperson said two votes; four names will be sent to the governor.

The chairperson asked if there were any other nominations for president-elect. John G. Newby, M.D. (Washington County), stated that there was, but he would like to preface the nomination with a few remarks. During the November 1992 Council meeting, when the action of the Executive Committee was presented for information only, Joseph Fastow, M.D., Council chairperson, told the members that if they did not agree with what he did, they could vote him out of office. Dr. Newby thought that statement was quite appropriate. Dr. Newby nominated Donald H. Dembo, M.D. (Baltimore City), for president-elect.

The chairperson asked if there were any further nominations. A motion was made and seconded to close the nominations for president-elect. The House of Delegates approved the motion.

Dr. Newby nominated Daniel I. Welliver, M.D. (Carroll County), for first vice-president. The chairperson inquired if there were other nominees for first vice-president. A motion and second to close the nominations were made. The nominations for first vice-president were closed.

The chairperson asked if there were any further nominations for second vice-president. There were no further nominations. The nominations for second vice-president were closed.

The chairperson asked if there were any other further nominations for third vice-president. There were no further nominations. Nominations were closed for this office.

The chairperson asked if there were any further nominations for secretary. Dr. Newby nominated Carol Bender, M.D. for the office of secretary. The chairperson asked if there were further nominations. There were no further nominations for secretary, and the nominations were closed.

The chairperson asked if there were any further nominations for treasurer. Dr. Newby nominated Albert L. Blumberg, M.D. The chairperson inquired if there were any further nominations. There were no further nominations, so the nominations were closed.

The chairperson asked if there were any further nominations for the Finney Fund Committee. There were no other nominations, and the nominations were closed.

The chairperson said that the nominees for delegates to the AMA for the period January 1, 1994, through December 31, 1996, were Drs. Donald Lewers and George S. Malouf, Sr. The chairperson asked if there were any further nominations for these positions. Dr. Newby nominated Frederick Miltenberger, M.D. (Washington County). Since there were no further nominations, the nominations for these positions were closed.

The chairperon noted that the two nominees for the AMA alternate delegate positions were Drs. Carol W. Garvey and Reynaldo L. Lee-Llacer. Dr. Newby nominated Louis C. Breschi, M.D. (Baltimore County), and Thomas E. Hunt, M.D. (Baltimore City). There were no further nominations, and the nominations were closed.

The chairperson noted that voting for the BPQA vacancies would take place the next day. Members of the House of Delegates and other physicians who were licensed in Maryland could vote.

The chairperson announced that ballots would be prepared for the contested offices, and voting would take place the next day at the second session of the House of Delegates. He further related that Article IV, Section 4, of Med Chi bylaws requires a ballot vote for all positions unless there is only one candidate for an office. In that case, the ballot may be dispensed with if the House of Delegates wishes to do so.

The chairperson asked Dr. Newby if the physicians he nominated would serve if elected. Dr. Newby stated that he had either spoken to, or those with whom he is associated with had spoken to, all the nominated individuals, and they had agreed to serve if elected. Dr. Snyder asked for a point of clarification. He noted that Dr. Blumberg had stated in a Council meeting that he would not run again for re-election and asked what changed his mind. Dr. Newby stated that Dr. Blumberg had told him that, but Dr. Newby said he told Dr. Blumberg that there were members who would like him to continue. Dr. Newby thought that if the membership voted for Dr. Blumberg, he would serve. He further stated that he held Dr. Blumberg in the highest regard, including his ethical standards.

The motion to not place the names of the uncontested positions on the ballot was brought to the floor. The House of Delegates approved the motion.

◆ *New business*

Dr. Bender made a motion that because of the lateness, a discussion of HB 1359 be tabled until the next day's session, and be placed as the first item on the agenda. It was noted that the election must be the first item of business when the second session began.

Dr. Nagel stated the membership had heard a lot of information regarding HB 1359; it was not going to be changed. He thought the question was how Med Chi was going to interface with the results of the bill. Dr. Nagel noted that there is an Ad Hoc Committee on Health System Reform, and that committee should look at how Med Chi is going to interface. Dr. Nagel urged the president-elect, when making appointments to that committee, to take into account everything he heard today from all sections because it was time for the House of Delegates to stop being split over this issue. Med Chi needed to go as one voice and not make decisions behind closed doors. Dr. Nagel moved that Dr. Fastow present to the House of Delegates tomorrow the report he had presented to Council today.

Rose Mary H. Bonsack, M.D. (Harford County), a member of the Maryland General Assembly House of Delegates, made a few comments about HB 1359. She stated that it was important for Med Chi to come to Annapolis with one voice, not divided. She has told Med Chi this for the last three years. She has had to fight to get Med Chi to decide what it wants to do. She also wished that when members served on committees, they understood that they must be available at any time to go to Annapolis and testify on bills of interest to their committee. Dr. Bonsack noted that HB 1359 started out as a 17-page bill. Over 400 amendments were presented, and the bill is now 77 pages. She concluded by stating again that when people are appointed to committees, Med Chi should make sure they are willing, committed, and available at any time to go to Annapolis. Dr. Bonsack thanked the members for their support, and thanked MMPAC for its support during the last three years.

Dr. Snyder stated that he thought HB 1359 was an immediate priority, and that there will be a working committee of the Executive Committee that will take the problem up and provide any information needed.

Dr. Bender said this bill was devastating and that many people do not know what was passed. She also thought it was not fair that physicians could not serve if they were not readily available to testify. Many physicians, because of their specialty, cannot be available on a moment's notice. That should, however, not exclude them from committee membership. She has letters from members of her component society who are offended by what has happened. They are offended by the sense that the Executive Committee has not conveyed the wishes of the majority of the membership. Although she heard today that we were losing, she had been in Annapolis and she thought that Med Chi was winning. She heard Casper Taylor state that after hearing from everybody, fee limits were withdrawn from the bill. Dr. Bender thought that Med Chi should have continued to pursue amendments to HB 1359; the membership feels let down, believing they have negotiated for nothing.

Alex Azar, M.D. commented on Dr. Bender's statements. Dr. Azar said that he asked the legislators point blank. He stated that the bill passed out of Senate committee, 44 to 2, in an unchanged, unmodified form. Both the Executive Committee and Dr. Bender worked very hard in trying to modify the bill. He resented what was being said and, as a member of the Executive Committee and a Med Chi member, he resented Dr. Bender's comments. He thought the type of comments made by Dr. Bender were very devisive to Med Chi.

While Dr. Azar was speaking, Dr. Bender asked Dr. Azar what his position was on HB 1359; did he agree to support the bill or not? Dr. Azar stated that he attended an emergency meeting of the Executive Committee on HB 1359. Present at that meeting were the lobbyist plus the internal Council members working on the bill. Dr. Azar noted that the Executive Committee was informed that if it took the position of totally opposing the bill, the Executive Committee would have absolutely no impact on the bill—that the Executive Committee could not modify it. By taking a position for the bill, however, the Executive Committee would be able to work to get a bill that was the best Med Chi could obtain—modified so Med Chi would not be in such an onerous position.

Again, Dr. Bender inquired what Dr. Azar's position was on the bill at that meeting. He stated that he supported the bill based on the information provided to the Executive Committee at that time. He supported the position to modify the proposed bill so that it would not be as onerous to physicians.

At this point, Dr. Nagel asked for a point of order. He asked the chairperson to rule the discussion out of order. The discussion was ruled out of order by the chairperson.

At that point, Dr. Nagel moved that any further discussion of the bill be tabled until the appropriate time as determined by the Speaker of the House of Delegates. Dr. Newby asked for a point of order, stating that delaying the discussion of the behavior of the Executive Committee on this bill was inappropriate; responsibility, responsiveness, and the ability of the House of Delegates to directly assign or praise responsibility and to reward or not reward members of the Executive Committee with higher office within Med Chi was directly related to its handling of HB 1359. To take the issue up at the next session of the House of Delegates was ridiculous because of the Executive Committee's complete change from opposition to this bill to support in a one-day span. Election of officers would either reward or punish those members who were responsible for this action. Dr. Newby thought, based on information from his senator, that Med Chi could have killed the bill. His senator told him that the legislature was for the bill because Med Chi was in favor of the bill.

A vote was taken on the motion to table the discussion until the appropriate time the next day. The House of Delegates voted to table the discussion until the next day's session of the House of Delegates.

◆ *Adjournment*

There being no further business, the meeting was adjourned at 6:10 p.m.

Respectfully submitted,
SECRETARY CAROL W. GARVEY, M.D.

THE FACTS ABOUT MRI IN BLACK AND WHITE.

Independent tests and physician reports confirm that MR images generated by a 1.5 Tesla MR system are of a higher resolution and superior quality than those produced by an open-air, low-field system.

At the MRI Center at Saint Joseph Hospital, we believe in giving physicians and patients the best diagnostic imaging services available anywhere. Which is why our facility features a General Electric 1.5 Tesla MR system.

Better images result in better diagnoses. And that's what we're here to provide.

MRI CENTER

At Saint Joseph Hospital

See the quality. Trust the care.

◆ Call to order

The 440th session of the House of Delegates was called to order by President Jose M. Yosuico, M.D., at 1:45 p.m. in the Chesapeake Room of the University of Maryland University College Conference Center, College Park, Maryland.

◆ Visiting dignitaries

- ✧ President-elect Thomas J. Maxwell, M.D., Delaware Medical Society
- ✧ Vice-president John H. Hobart, M.D., Pennsylvania Medical Society
- ✧ President George E. Broman, M.D., Virginia Medical Society
- ✧ Raymond Scalettar, M.D., AMA Board of Trustees chairperson
- ✧ Michael Murray, AMA senior vice-president

◆ Election of officers

a. Rules for nominating speakers. The president announced the rules for nominating speakers. Only one speaker per candidate, either the candidate or a spokesperson for that candidate, would be allowed. Each speaker would be limited to three minutes, and the secretary would hold up a "30-second" and then a "Time" sign. The president inquired if there were any objections to the presented procedure. There were no objections.

b. Tellers. The president appointed Drs. Hiroshi Nakazawa, Thomas E. Allen, J. RIchard Lilly, and Allan D. Jensen to serve as tellers for the election of contested positions. Dr. Nakazawa was asked to be chief teller. The election was to be by written ballot.

c. Speeches for nomineees.

◆ President-elect nominees ◆

Joseph S. Fastow, M.D., and Donald H. Dembo, M.D.

Joseph S. Fastow, M.D. Hilary T. O'Herlihy, M.D. (Anne Arundel County), spoke on behalf of Dr. Fastow (Calvert County). Highlights were as follows:

- ✧ Received M.D. degree from Boston University.
- ✧ Trained at the Philadelphia, George Washington, and Johns Hopkins hospitals.
- ✧ Is currently associate professor of medicine at Georgetown University.
- ✧ Is board certified in emergency medicine.
- ✧ Is a fellow of the American College of Emergency Physicians; from 1980 to 1982, was president of the Maryland Chapter.
- ✧ In 1991-1992, was president of the Calvert County Medical Society.
- ✧ Since 1985, has been a House of Delegates member and emergency room director at Memorial Hospital.
- ✧ Has been a councilor since 1987.
- ✧ From 1991 to 1992, was chairperson of the Policy and Planning Committee, which, during his tenure, increased Executive Committee membership from 7 to 11 members, which, in turn, enlarged the representation of the Med Chi decision-making body.
- ✧ From 1992 to 1993, was chairperson of Council. One difficult decision made during that time was hiring an in-house general counsel. Dr. O'Herlihy noted that most physicians he has talked to regarding this matter thought this was the correct decision.

- ✧ Dr. O'Herlihy said that Dr. Fastow was one of the hardest working physicians in a Med Chi leadership position that he has seen during the 25 years he has been a member.
- ✧ Dr. O'Herlihy noted that Dr. Fastow's decisions are well thought out and have Med Chi in mind.

Donald H. Dembo, M.D. Frederick Miltenberger, M.D. (Washington County), spoke on behalf of Dr. Dembo (Baltimore City), noting the following:

- ✧ Has known Dr. Dembo for over 20 years and has utmost respect for him.
- ✧ Is presented as a nominee on a reformed slate of officers.
- ✧ Is extremely well qualified as a physician and a medical citizen.
- ✧ Has been president of the Maryland Society of Cardiology and the American Heart Association.
- ✧ Is presently chief of cardiology at Good Samaritan Hospital and a teaching scholar at Sinai Hospital.
- ✧ Holds the position of assistant professor at Johns Hopkins.
- ✧ Lectures nationally and internationally.
- ✧ Is involved in health system reform and is liaison from the American College of Cardiology to Congressperson Ben Cardin.
- ✧ Has testified for Med Chi in Annapolis for at least 20 years, and Dr. Miltenberger thought that Dr. Dembo had been an extremely effective spokesperson for Med Chi in Annapolis.
- ✧ Chaired the Med Chi Committee on Managed Care and Third-Party Liaison for several years.
- ✧ Is president-elect of, and councilor from, the Baltimore City Medical Society.

◆ First vice-president nominees ◆
Alex Azar, M.D., and Daniel I. Welliver, M.D.

Daniel I. Welliver, M.D. Daniel I. Welliver, M.D. (Carroll County), spoke on behalf of himself.

- ✧ He noted that he has been active in Med Chi for over 35 years, serving on the Executive Committee and Council.
- ✧ He is also a member of the Board of Physician Quality Assurance.

Alex Azar, M.D. Alex Azar, M.D. (Wicomico County), spoke on behalf of himself. He noted the following:

- ✧ Most members know what Dr. Azar stands for, which is a united Med Chi front, and he has always tried to put the best interest of Med Chi in the forefront.
- ✧ Thinks dissent is important in an organization and has always supported dissent.
- ✧ Is opposed to block seating and voting.
- ✧ Thinks physicians have gone through more rigid screening than any other profession. Physicians have to be topnotch to get into medical school, to complete medical school, and to practice medicine.
- ✧ All his efforts have been focused on doing what is best for Med Chi.
- ✧ Admitted that he has made mistakes, but has made the best decisions he could based on available information, and has tried to listen to the other side.

◆ Secretary nominees ◆
Carol L. Bender, M.D., and Paul A. Stagg, M.D.

Carol L. Bender, M.D. Carol L. Bender, M.D. (Montgomery County), spoke on behalf of herself and noted the following:

- ✧ Physicians are highly educated.
- ✧ When politicians deal with physicians, the politicians ask the physicians to forget their years of training and sacrifice. Physicians, however, have dedicated their careers and lives to giving care and service to others. Therefore, physicians are patient advocates and caretakers.
- ✧ Would like to be Med Chi's advocate.
- ✧ Advocacy career was born when Medicare fees became a problem, which affected her livelihood.
- ✧ Singlehandedly led a proxy fight against the Medical Mutual Liability Insurance Society of Maryland (Med Mutual), which wanted to insure attorneys. She thought this would be a massive conflict of interest since the attorneys would testify in Annapolis against tort reform, stating it would not make any difference on insurance premiums anyway. Med Mutual also wanted to deprive Med Chi of a seat on its board of directors and was generally hostile to physicians. Dr. Bender further stated that because of the proxies she obtained, the Med Chi executive director now sits on the Med Mutual board of directors.
- ✧ Has testified in Annapolis on mandatory Medicare assignment and, during the recent legislative session, testified and rallied against HB 1359.
- ✧ Asked the House of Delegates to look at her many years of experience with major issues. Dr. Bender stated that she is respected in the political arena. She went on to say that she offers "absolute honesty, integrity, purpose, and dedication."

Paul A. Stagg, M.D. Paul A. Stagg, M.D. (Dorchester County), spoke on behalf of himself. He noted the following:

- ✧ Graduate of Louisiana State University School

of Medicine.

- ✧ After residency, received certification from the board of surgery.
- ✧ Spent some years in US Air Force and then settled in Dorchester County, where he has been for about 19 years.
- ✧ Has been a Council and House of Delegates member for several years and a member of several Med Chi committees.
- ✧ During this annual meeting, received a certificate commending his leadership of the Ad Hoc Committee on Self-Referral.
- ✧ Is interested in being a Med Chi leader because he believes Med Chi is vitally important to physicians, to patients, and to the health of the men, women, and children throughout the state. Med Chi has to be able to deal with all the legal and economic issues coming up. This can only be done with the proper presence in Annapolis.

◆ Treasurer nominees ◆
Albert L. Blumberg, M.D., and Carol W. Garvey, M.D.

Albert L. Blumberg, M.D. Albert L. Blumberg, M.D. (Baltimore County), spoke on behalf of himself. He began by noting that in January he informed Council he was not planning to seek office. He also stated that he has been promised by the Council chairperson that issues Dr. Blumberg was trying to address within the organization would be addressed. Since he did not wish his candidacy to diffuse focus from what he thought were the important issues of Med Chi governance and accountability, he withdrew his name for consideration for treasurer. He also asked the House of Delegates to consider delegates from Baltimore County whose names had been placed on the ballot for other leadership positions.

At this time, the chairperson noted that the office of treasurer was uncontested and congratulated Dr. Garvey. Dr. Garvey thanked the House of Delegates for the position and its support.

◆ AMA delegate nominees ◆
Donald T. Lewers, M.D.; George S. Malouf, Sr., M.D.; and Frederick Miltenberger, M.D.

Donald T. Lewers, M.D. George S. Malouf, Sr., M.D. (Prince George's County), spoke on behalf of Dr. Lewers (Talbot County), even though Dr. Malouf was also running for the position. Dr. Malouf noted the following:

- ✧ Has known Dr. Lewers for many years.
- ✧ Has served as vice-chairperson of the AMA delegation.
- ✧ Dr. Lewers is past president of Med Chi, past chairperson of Council, and has been a delegate to the AMA for several years.
- ✧ Dr. Lewers has been a real leader at the AMA in that he served on the AMA's Legislative Committee; he is now chairing that committee. Dr. Malouf noted that seniority and longevity at Med Chi counts at the AMA level. Effectiveness at the AMA level comes only after many years of labor. Therefore, Dr. Malouf thought the House of Delegates should support Dr. Lewers for AMA delegate.

George S. Malouf, Sr., M.D. Allan D. Jensen, M.D. (Baltimore City), spoke on behalf of Dr. Malouf (Prince George's County), whom he has known for over 12 years.

- ✧ Dr. Jensen noted that everyone knows Dr. Malouf well.
- ✧ Dr. Malouf is a practicing ophthalmologist and has been a Med Chi president.
- ✧ Is a gentleman, and is effective, diplomatic, and honest.
- ✧ Has the ability to get things done.
- ✧ Is able in meetings to lead a group in making a decision in the right direction when members are having problems doing so.
- ✧ Is influential and belongs to many civic and religious organizations.
- ✧ Is very generous with his time and other resources.
- ✧ Has received the highest AMA award for humanitarian services—the Benjamin Rush Award.
- ✧ Is an effective and wonderful spokesperson for Maryland.

Frederick Miltenberger, M.D. Frederick Miltenberger, M.D. (Allegany County), spoke on behalf of himself, noting that he was asked to put his name up for this slot and was willing to do so. He told the House of Delegates that if it wanted a fresh face, he was willing to serve.

◆ AMA alternate delegate nominees ◆
Louis C. Breschi, M.D.; Thomas E. Hunt; Reynaldo L. Lee-Llacer, M.D.; and Carol W. Garvey, M.D.

Louis C. Breschi, M.D. John H. Hebb, M.D. (Baltimore County), spoke on behalf of Dr. Breschi (Baltimore County).

- ✧ Dr. Breschi is an incumbent to the position, and seniority and longevity are important to the position.
- ✧ Dr. Breschi has served Med Chi well for a long time; his medical career has been one of dedication to Med Chi.
- ✧ Has been president of Franklin Square Hospital.
- ✧ Has been on the Committee of Professional Ethics for 10 years and has chaired the committee for 5 years.
- ✧ Has been on the Physician/Patient Relations Committee for 21 years and has also chaired that committee. Has served on four other Med Chi committees.
- ✧ Is a well-known expert on ethics and is constantly

consulted by judges, lawyers, and legislators; Dr. Breschi is in a good position to give an opinion.

- ✧ Dr. Hebb noted that the Baltimore County Medical Association endorses Dr. Breschi's candidacy, and asked that the House of Delegates send Dr. Breschi back to the AMA where his talents are needed.

Thomas E. Hunt, M.D. Donald H. Dembo, M.D. (Baltimore City), spoke on behalf of Dr. Hunt (Baltimore City). Dr. Dembo noted the following:

- ✧ Dr. Hunt is a gentleman.
- ✧ Is in private practice and is an orthopaedic surgeon.
- ✧ Is president of the University of Maryland Alumni Association, president of the Baltimore City Medical Society, and past president of the Maryland Orthopaedic Society—he knows leadership.
- ✧ He knows and understands the needs and value of good communication skills.

Reynaldo L. Lee-Llacer, M.D. Reynaldo L. Lee-Llacer, M.D. (Prince George's County), spoke on behalf of himself.

- ✧ He stated he believes in teamwork because "a house divided cannot stand."
- ✧ Thinks working together is important and brings out the best in each member.
- ✧ Has served Med Chi and his county society for several years. At Med Chi, he has been chairperson of the Bylaws Committee for three successive presidents, was vice-chairperson of Council and chairperson of Council, and president-elect and president.
- ✧ Has traveled all over the state communicating Med Chi's message.
- ✧ Believes every member of the organization should be told what is being done for them.
- ✧ Asked for the support of the House of Delegates.

Carol W. Garvey, M.D. Bruce E. Rubin, M.D. (Montgomery County), spoke on behalf of Dr. Garvey (Montgomery County) and stated:

- ✧ Dr. Garvey is a person of great character and individuality.
- ✧ She is thoughtful and considerate of others.
- ✧ She hears and considers all sides of issues very thoroughly.
- ✧ Makes decisions with insight and knowledge of the subject matter.
- ✧ Exhibits excellent administrative skills and the ability to find consensus among her fellow physicians.
- ✧ Researches and knows the issues and represents constituents in an assertive and fair manner.
- ✧ Is an effective communicator. Oversees and guides others through the resolution of potential conflicts. Has been an effective, trustworthy, and loyal voice for her patients, for public health, and for the physician community.
- ✧ Has given generously and eagerly of her time.
- ✧ Has served Montgomery County Medical Society extremely well as its immediate past president and as chairperson of the Public Health Committee; has been an active member of the Executive Committee for years.
- ✧ Has served Med Chi on its Executive Committee as secretary for the last two years and on numerous committees: chairperson of the Ad Hoc Special Committee on Laboratory Regulations, the Ad Hoc Committee on Self-Referral, and subcommittees of the Public Health Committee.
- ✧ If elected, would be the only woman on the AMA delegation. Dr. Rubin thought that the delegation should be more broadly representative of medicine as a whole; almost 25% of physicians are women.
- ✧ Also, Montgomery County Medical Society, as the second largest Med Chi component society, has had no representation on the delegation for the last few years.
- ✧ Dr. Rubin concluded that for the type of leadership, character, and personality that Dr. Garvey has to offer, for the fact that she represents all women physicians of Maryland, and for the fact that Dr. Garvey represents Montgomery County, which has been terribly represented on the delegation, the House of Delegates should strongly support and vote for her.

d. Distribution of ballots. At this point, tellers distributed ballots, and the House of Delegates voted.

◆ *Auxiliary report*

Myrna Goodman, president of the Med Chi Auxiliary, presented the auxiliary's report. Ms. Goodman noted that the auxiliary's health program for 1992-1993 had been awareness and prevention of violence and breast cancer. The auxiliary plans to continue with these programs for the next year. Billboards displaying the message that mammography was the best weapon against breast cancer were placed in conspicuous sites by various counties; two billboards were sponsored by Med Chi. By the end of the month, the auxiliary planned to sponsor at least 30 free mammograms for indigent women in Maryland.

In legislative matters, the auxiliary worked closely with Med Chi and other medical societies to let legislators know their views on issues affecting the quality of health care. Ms. Goodman stressed the need for a united front if Med Chi wishes to gain the attention of those in Washington, DC. She emphasized that the support of every spouse and physician was

needed. A new partnership was necessary to see that the quality of health care is not sacrificed.

President Yosuico presented Ms. Goodman with a certificate of appreciation at the conclusion of her report.

◆ *Certificate of appreciation for Jose Martinez, M.D.*

The president personally thanked Dr. Martinez for his work during the legislative session. He presented Dr. Martinez with a certificate of appreciation. Dr. Martinez said he would cherish this tangible evidence of his efforts. He said he knew Dr. Yosuico has been behind him with moral support during the legislative session.

◆ *New business*

a. House Bill 1359. At this time, a motion was made to discuss HB 1359. The chairperson read the motion for informational purposes. Dr. Blumberg asked to submit a resolution with the permission of the House of Delegates.

Dr. Malouf asked for a point of order. He noted that since there was a motion on the floor, if no one wished to take any action, the matter should be dropped. Dr. Blumberg responded that the Baltimore County Medical Association wished to submit the following substitute resolution:

> Whereas passage of HB 1359 may result in global budgets by the establishment of cost goals;
>
> Whereas the bill contains no mandate for business to purchase insurance;
>
> Whereas the Medical and Chirurgical Faculty's support of the bill was achieved by coercion and threats; and
>
> Whereas this bill has elements contrary to current Med Chi policies (endorsement of Health Access America): Therefore, be it
>
> *Resolved,* That the Legislative Committee of Med Chi review current Med Chi policy as it applies to House Bill 1359, changes in Health Access America, and anticipated state and federal initiatives; and be it further
>
> *Resolved,* That this committee report to the House of Delegates at a special meeting July 15, 1993; and be it further
>
> *Resolved,* That the report consist of, but not be limited to, recommendations of necessary changes in Med Chi policy and/or state legislation.

Dr. Snyder noted that he had read the resolution. Although he did not agree with all the "whereas clauses," the resolution was something he had been planning to implement anyway, expanding it to include HB 1359 and to schedule a discussion as soon as feasible on the legislative effort. Dr. Snyder said he planned to review the legislative actions with the Executive Committee and the new leadership, and would bring the issues back to a special session of the House of Delegates on July 15.

J. David Nagel, M.D. (Baltimore County), was then recognized by the president. Dr. Nagel spoke on behalf of the Baltimore County Medical Association. He hoped Dr. Snyder would be at the Council meeting on July 15. He thought it would be a simple matter to expand that Council meeting into a House of Delegates meeting.

Dr. Snyder announced that there would be a House of Delegates meeting in Baltimore on July 15 to discuss HB 1359. Dr. Snyder said the machinery will be set up to investigate and bring back reports and discuss them.

b. Nominees for the Health Care Access and Cost Commission. Dr. Bender noted that Montgomery County Medical Society was concerned about Med Chi sending names of nominees to the Health Care Access and Cost Commission. She hoped that more than one name would be submitted. She said the Montgomery County Medical Society would like to put forth the name of Marvin Schneider, M.D., to represent the Montgomery County Medical Society.

The chairperson then asked if there were other names House of Delegates members would like to present. Donald W. Mintzer, M.D. (Baltimore City), said he would like to recommend the name of Donald H. Dembo, M.D. (Baltimore City). The chairperson noted that names were not being sent at this point. Dr. Lee-Llacer (Prince George's County) asked that Hilary T. O'Herlihy M.D. (Anne Arundel County) be included.

George S. Malouf, Sr., M.D. (Prince George's County), asked that Allan D. Jensen (Baltimore City), be added to the list. George S. Malouf, Jr., M.D. (Prince George's County), asked that Brian S. Bayly, M.D. (Prince George's County) be included.

John G. Newby, M.D. (Washington County), urged the president to send an official letter to all component societies and subspecialty societies requesting nominations on all of the entities so that a reasonable slate of individuals could be presented. He also requested that the letter ask for a brief curriculum vitae. Dr. Snyder noted that staff had already taken that into consideration.

Dr. Snyder noted that a letter will be sent to all component and specialty societies asking for names they wished to submit. The Executive Committee would select the names to be forwarded to the governor.

c. ***Specialty societies.*** Howard L. Siegel, M.D. (Baltimore County), said he was president-elect of the Maryland Society of Pathologists. He said the specialty society was asking the Executive Committee to explore ways to bring specialty societies back into Med Chi. He suggested that this could be done by communication, by attending specialty society meetings, by

telling specialty societies what their national organization is doing, and by offering services (e.g., giving specialty societies a place for their mailings, handling treasurer reports, and managing billings and accounts). Dr. Siegel thought that if Med Chi would explore this, specialty societies would know they have a single organization in which they can air their differences.

Dr. Snyder noted that specialty societies did have special representation in the House of Delegates and Council. Dr. Snyder thought that specialty societies were well represented in Med Chi at the present time. He thought it was important that everyone work together and said he would like to hear from the Committee on Specialty Societies regarding ways in which Med Chi could deal with this situation.

Michael R. Dobridge, M.D. (Montgomery County), was recognized by the chairperson. Dr. Dobridge noted that the Committee on Specialty Societies was developed so the societies would be recognized in the House of Delegates. The committee is allowed to have seven delegates in the House of Delegates. Dr. Dobridge said that the representation was deliberately established to enhance communication within the medical community. At that point, Dr. Dobridge asked if any delegates from the Committee on Specialty Societies were present.

Dr. Breschi noted that he was one of the first members of that committee. Although he found the reasons for the committee were good, he thought the problem the people on the committee now have is that there is not enough direction from Med Chi leadership—asking them what they want and vice versa. Dr. Breschi said that when he was on the committee, he did not know what Med Chi wanted or what the committee should provide.

Dr. Malouf said Med Chi used to have a meeting of the specialty society presidents and vice-presidents and the Med Chi leadership (president and chairperson of Council). Dr. Malouf thought that what he was seeing today was that the specialty society leadership wanted to be linked directly with the Med Chi leadership. Therefore, Dr. Malouf thought the new Med Chi leadership should meet with the specialty society leadership to begin a dialogue.

Daniel E. Kohn, M.D. (Baltimore City), chairperson of the Committee on Specialty Societies, stated that the committee is open and welcomes representatives from all specialty societies. Dr. Kohn noted that committee participation has been less than favorable. He would like all specialty societies to participate.

Dr. Azar asked that a staff person be put in charge of helping specialty societies have a central coordinating base. Dr. Azar thought the specialty societies should be offered those services. He thought that Med Chi should provide services to specialty societies in order to cement relationships and improve communication between specialty societies and Med Chi.

◆ *President's address*

Dr. Yosuico thanked the House of Delegates for electing him president. He stated that while doing the "president's business," he was able to travel all around the state and to other states in his role as president and AMA delegate.

In his travels, Dr. Yosuico noted a change in physician attitudes. He thinks this is a reaction to a fear of the unknown—the unknown brought about by change. Dr. Yosuico said everyone must realize that no amount of struggle or force will allow anyone to stop health system reform on the federal and state level, but by being prepared for change, one can reduce anxieties.

Dr. Yosuico then highlighted changes in medicine that have transpired over the years, including new technology and scientific breakthroughs, such as immunizations, which have done away with diseases physicians used to treat (e.g., smallpox, polio, and leprosy). Dr. Yosuico noted that the profession of medicine is itself a profession of change.

He stated that physicians are now feeling frustrated because the rules are changing again as they did in 1965 by passage of Medicare and Medicaid legislation. Many physicians worry that new rules will have a negative effect on physicians and their patients.

Physicians need to convert challenge into productive work and anxiety into action. This could be done by harnessing members' anxieties and focusing emotions—turning these factors into productive coordinated action so that physicians can meet the challenges of medical leadership in these troubled times.

Dr. Yosuico thought it was time for physicians to stop noting their differences and join the majority, enhancing the single voice of Med Chi. He further noted that change could be positive. It can stimulate growth, make a person stronger and more understanding, and thereby transform medicine for the good.

◆ *Change of office ceremonies*

Joseph Snyder, M.D., was installed as the 1993-1994 president by the outgoing president, Jose M. Yosuico, M.D. Also present were Dr. Snyder's wife Madrian and his daughter, Lori.

Dr. Snyder presented Dr. Yosuico with the past president's medallion. Dr. Yosuico then presented Dr. Snyder with the gavel, which signified the change of office.

◆ *Incoming president's remarks*

Dr. Snyder noted that he has seen many changes take place in organized medicine during his tenure as councilor, AMA delegate, and president-elect. He mentioned that health system

reform is a growing concern to physicians, and it means more change. Dr. Snyder went on to say that change should be good and encouraging because it is the future. Because Maryland has placed itself in the forefront with its health system reform legislation, a responsibility has been placed on physicians of state medical societies to be a part of the change. He said it was important for Med Chi members to work as a unit toward one goal; members should remember that nothing can happen without Med Chi involvement. Dr. Snyder believed it was important that members put their personal differences aside. He thought there was a need for increased participation by physicians in the medical society process locally, statewide, and nationally. Dr. Snyder went on to say that every Med Chi member should make it a personal goal to recruit physicians to become members of the organization. He concluded his speech by thanking the House of Delegates for allowing him to serve as president.

◆ Election of officers

The results of the election were as follows:

- ✧ *President-elect:*
  Donald H. Dembo, M.D.
- ✧ *Secretary:*
  Paul A. Stagg, M.D.
- ✧ *Treasurer:*
  Carol W. Garvey, M.D. (uncontested)
- ✧ *First vice-president:*
  Alex Azar, M.D.
- ✧ *Second vice-president:*
  J. Ramsay Farah, M.D. (uncontested)
- ✧ *Third vice-president:*
  Thomas E. Allen, M.D. (uncontested)
- ✧ *AMA delegates:*
  George S. Malouf, Sr., M.D.
  Donald T. Lewers, M.D.
- ✧ *AMA alternate delegates:*
  Louis C. Breschi, M.D.
  Reynaldo Lee-Llacer, M.D.

Each person who won and ran for a contested position gave a short speech thanking the members for their support and confidence.

◆ Adjournment

There being no further business, the meeting was adjourned at approximately 5:30 p.m.

Respectfully submitted,
SECRETARY CAROL W. GARVEY, M.D.

Now is the time for direct dialogue with members of the Administration and Congress. And now, the American Medical Association (AMA) brings you the *Physicians' Forum: Agenda for Action,* an unprecedented opportunity for every physician to interact with policy makers and help shape the way health care will be delivered.

Speak face to face with Congressional leaders, Presidential advisors and top Administration officials on the political pressures that will ultimately form health care policy. Help ensure that patients' needs remain the focus of reform. Hear governors and heads of state health departments describe how their states are preparing for a new national policy.

The Physicians' Forum series of conferences invites all physicians, not just AMA members, to join the dialogue on issues vital to their practices. Physicians, board members and officers of the AMA will come together to reach common ground.

Voice your concerns about the coming changes. Do not wait passively for those changes to be imposed without your input. The *Physicians' Forum* is the time and place to speak out and make an impact.

Your attendence is crucial.
Call toll free 800 621-8335.
Conference fee for meeting facilities and food service—AMA members $50, nonmembers $125. MasterCard, Visa, American Express, Optima are accepted.

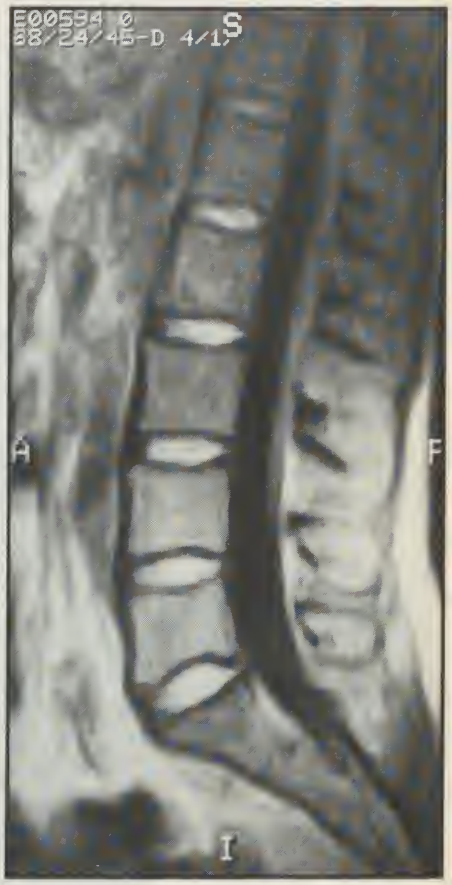
Two Reasons Why You Should Refer Your Patients To Accessible MRI:



1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

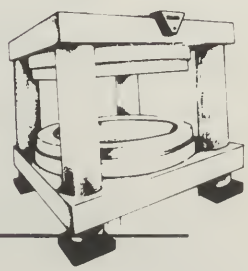
T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

T-1 Midline Sagital Lumbar Spine MRI of a normal spine.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.



We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

Committee on AIDS

Mr. President and Members of the House of Delegates:

During the past year, the Committee on AIDS (acquired immunodeficiency syndrome) focused on developing a strategic plan that would define goals and objectives for the committee to strive to achieve. This strategic plan addressed human immunodeficiency virus (HIV) screening and prevention, education of the public, professional education, protection for health care workers, protection of patient confidentiality, improvement in caring for HIV-positive and AIDS patients, and legislative initiatives. Council approved the following strategic plan at its meeting of January 21, 1993;

1.0 HIV screening and prevention

1.1 Offer HIV testing in all drug rehabilitation programs, at STD [sexually transmitted disease] and public health clinics, and in secondary schools and colleges.
1.2 Continue anonymous HIV testing in a minimum of 11 public health clinics.
1.3 Report positive HIV status by unique identifier.
1.4 Report CD4 counts of <200 (if HIV+) as per state law.
1.5 Provide, through public health clinics, partner notification for HIV+ individuals upon request.
1.6 Increase number and funding of drug rehabilitation programs.
1.7 Provide needle exchange programs
1.8 Provide condom availability through drug rehabilitation, public health clinics, and school nurses.
1.9 Increase the opportunity for voluntary HIV testing through physician offices, clinics, independent laboratories, and hospitals.
1.10 Oppose mandatory testing of any groups.
1.11 Continue to explore immunity for individuals who report HIV+ individuals who willfully expose others.

2.0 Public education

2.1 Cooperate with public health departments to develop a speaker's kit, including slides.
2.2 Develop public information newspaper columns.
2.3 Improve public school AIDS awareness and education.
2.4 Encourage local Med Chi chapters to assist local school boards in developing AIDS awareness and education programs.
2.5 Review current public school programs.

3.0 Professional education

3.1 Continue to support professional education through Med Chi and other existing agencies.
3.2 Provide *Communicable Diseases Bulletin* and *Moore Newsletter* to all primary care physicians in Maryland.
3.3 Continue AIDS education segments at Med Chi annual meetings.
3.4 Establish AIDS column for *Maryland Medical Journal.*
3.5 Develop special edition of *Maryland Medical Journal.*
3.6 Support dissemination of AIDS teaching materials.

4.0 Protection of health care workers

4.1 Staff AIDS review committee for physicians who are HIV positive.
4.2 Encourage voluntary, anonymous testing of health care workers.

5.0 Protection of patient confidentiality

5.1 Protect all positive HIV tests.
5.2 Protect name of index case in partner notification cases.

6.0 Improvement of care for HIV+ and AIDS patients

6.1 Improve medical assistance compensation for HIV and AIDS.
6.2 Continue and increase number of diagnostic and education units (DEUs.)
6.3 Advocate with third-party payers for AIDS patients.
6.4 Increase number of provider members of Committee on AIDS.

7.0 Legislative issues

7.1 Establish educational forum for legislators.
7.2 Continue review of proposed legislation.

The Committee on AIDS also presented Council with a suggested educational forum format for legislators. At its meeting of January 21, 1993, Council approved of this forum during which members of the committee were to present a brief panel discussion of the following:

- What is HIV and how is it transmitted?
- What is the current status of HIV in Maryland?
- What are physician recommendations for HIV legislation?

Because the legislative session had already begun, the committee thought it was too late for the educational forum this

year, but the committee is planning to hold the forum next year.

Committee members became actively involved in the 1993 legislative session and reviewed HB 50 (Fire, Rescue, and Emergency Medical Services Personnel—Bill of Rights) and SB 119 (State Fire Marshal—Notification of Exposure to Contagious Disease or HIV). The committee recommended that Med Chi take no position on these bills.

The committee also became actively involved in the debate about the feasibility of the Department of Health and Mental Hygiene (DHMH) developing a unique identifier system. DHMH testified in Annapolis that it was unable to develop a unique identifier number having a duplication error of less than 2% and that would assure the confidentiality of the patient. Furthermore, the issue of funds to support such a system seemed problematic. It has been the committee's position that named reporting is unacceptable, and the effort to force named reporting did not pass the legislature this session.

Another activity in which the committee was involved was the development of a universal precautions poster that must be displayed in physicians' offices. The committee worked with the DHMH AIDS Administration to finalize the poster for physicians' offices.

This year, the Committee on AIDS sponsored a session at the annual meeting entitled "Case Management of the Seropositive HIV Patient." The speakers for the session included Lois Eldred, P.A., M.P.H., director of Support and Education Services, the Moore Clinic, Johns Hopkins Hospital; Eric Fine, M.D., assistant director, AIDS Help Services, DHMH; and Pamela Wilson, M.S.W., clinical case manager, Adult HIV Program, University of Maryland Medical System. The educational session was well received by the physicians who attended, and it provided a wealth of information and resources for physicians to use in their practices.

The Committee on AIDS looks forward to working on implementation of the strategic plan and educational forum for legislators in the coming year.

Committee on Alcoholism and Chemical Dependency

Mr. President and Members of The House of Delegates:

The Committee on Alcoholism and Chemical Dependency continued its efforts toward raising awareness concerning the dangers of alcohol and drug abuse, including smoking. Nine meetings were held during the past year. The committee continued to gather information on tobacco consumption to help aid Med Chi efforts to reduce and eventually eliminate smoking, especially among our youth.

The committee supported legislation aimed at decreasing and discouraging the consumption of alcohol and tobacco products in Maryland. The committee also supported bills to restrict the sale of tobacco products and supported measures to restrict smoking at the new Oriole Park at Camden Yards. Members of the committee also supported the recently enacted ban on smoking in the seating area and restrooms of Oriole Park at Camden Yards and recommended that a letter congratulating the Baltimore Orioles Baseball Club on its stand for health be forwarded to President Larry Lucchino, Baltimore Orioles Baseball Club, Inc. Such a letter was approved by the Executive Committee and forwarded from President Jose M. Yosuico, M.D. to Mr. Lucchino.

In a joint effort with the Committee on Physician Rehabilitation, the Committee on Alcoholism and Chemical Dependency developed tobacco advertisement warning labels to be placed on magazines in physicians' waiting rooms. The labels were forwarded to Maryland physicians via direct mail,

the *Maryland Medical Journal,* and *Straight Forward.* The labels received wide coverage, including a press conference to introduce them; they have been well received by the medical community.

Also in concert with the Committee on Physician Rehabilitation, the committee sponsored a highly successful conference, *The Third Annual Conference on Addiction: Physician Health and Education*, which took place on November 21, 1992.

In addition, the Alcoholism and Chemical Dependency Committee reviewed and critiqued the Med Chi substance abuse education project curriculum, *Substance Abuse Education for the Primary Care Physician.* The curriculum was designed for practicing physicians to teach them how to screen, diagnose, counsel, and refer substance-abusing patients.

The committee continues to work diligently to address a wide range of concerns about substance abuse, and looks forward to cosponsoring the fourth annual conference on addiction in the fall of 1993.

As chairperson, I wish to thank Med Chi, the committee members, and our staff for their assistance and support this past year.

❑ ❑ ❑

Ad Hoc Bicentennial Committee

Mr. President and Members of the House of Delegates:

The Ad Hoc Bicentennial Committee met twice during the 1992-1993 year. Since it is a new committee, these first two meetings focused on defining the purpose and goals of the bicentennial.

There is a strong belief that the focus of the bicentennial should be educational. It is an opportunity to remind the public that Med Chi has, for 200 years, served the public through improved health care. The committee agreed that in all programs planned for the celebration, it is important to focus on how individuals can take care of their own health, to steer away from the didactic, and to convey the complexity of medicine.

Some suggested programs include developing joint exhibits with the Maryland Science Center and the Maryland Historical Society, holding panel discussions on topics of interest to both physicians and the general public, conducting the 1999 annual meeting in Annapolis, and promoting the bicentennial through a logo and lapel pin. (The logo has been designed and the pin commissioned. The design of both is the Med Chi seal superimposed over a Maryland flag. Around the edge is inscribed, "Medical and Chirurgical Faculty of Maryland 1799-1999.")

The committee goal for the next year is to lay the groundwork for these plans. In particular, committee members will work closely with the Public Relations Committee on establishing media contacts, finding speakers, and defining themes for panels.

❑ ❑ ❑

Computers in Medicine Committee

Mr. President and Members of the House of Delegates:

The Computers in Medicine Committee has completed another productive year under the direction of its chairperson, Rafael C. Haciski, M.D. Meeting on a monthly basis throughout the year, the committee has stayed abreast of technological developments and continued to provide educational support for Med Chi physicians and their staffs.

The committee has several important charges, the first of which concerns education. To meet that charge, courses were offered in computer software and hardware selection, beginning with a seminar at the Med Chi semiannual meeting in Ocean City in September 1992, and concluding with the presentation at the Med Chi annual meeting in April 1993. Additional presentations were given by Dr. Haciski at various hospitals, providing the gathered physicians with guidance in office systems selection. Individual committee members have also independently counseled Med Chi physicians on various aspects of computerization and remain constantly available for such advice.

The second important committee charge concerns maintenance of the electronic bulletin board service, MedSig. This important service, which provides a means of rapid and convenient communication between members using diverse computers, continues to be available to all Med Chi physicians under the watchful eye of H. Gerald Oster, M.D. Prime features are the ability to transmit text and allow for its review and editing by the recipient and subsequent re-transmittal of corrected text to the originator of the message. All of this can be accomplished without the use of paper and on totally different and otherwise incompatible computers.

Looking to the future, physicians are becoming increasingly concerned about the menacing threats of managed care, bringing with it the need for computerized monitoring of transactions and interchange of medical information. The committee plans to be involved in the development of new systems and the implementation of available technology to facilitate such computerization and to make the situation more favorable and easier to manage for the practicing physician.

❑ ❑ ❑

Continuing Medical Education Review Committee

Mr. President and Members of the House of Delegates:

The Continuing Medical Education Review Committee (CMERC) met six times during the past year, carrying out its responsibility to monitor the 61 hospitals and organizations accredited by Med Chi to sponsor intrastate continuing medical education activities eligible for Category 1 of the American Medical Association's (AMA's) Physician's Recognition Award. Through the authority delegated by the Accreditation Council for Continuing Medical Education (ACCME) to survey and accredit institutions to sponsor their own CME activities, CMERC is responsible for providing education, guidance, and consultation to accredited institutions as they strive to provide the best possible educational activities for their physicians.

The committee's activities included

- ✦ conducting six on-site surveys;
- ✦ conducting four reverse-site surveys;
- ✦ granting initial accreditation to three institutions;
- ✦ placing one sponsor on probation for a one-year period;

- ✦ reviewing 21 interim reports;
- ✦ reaccrediting six sponsors; and
- ✦ providing nine consultative visits to sponsors.

Significant changes in CME policies and procedures occurred during the past year including the issuance, by ACCME, of new standards for commercial support of CME, the release of the Food and Drug Administration's (FDA's) long-awaited policy statement on industry-supported scientific and educational activities, and AMA's announcement of an additional choice for the Physician's Recognition Award—certificate with "Special Commendation for Self-Directed Learning." In order to keep Med Chi's accredited sponsors abreast of these changes and current interpretations of the *Essentials and Standards*, the CMERC presented a workshop titled "Demystifying the Essentials: CME Policies and Procedures" at the Med Chi annual meeting. Over 70 physicians and CME staff personnel attended the session on April 30, 1993.

The following hospitals and organizations are accredited by Med Chi:

1. American Cancer Society—Maryland Division
2. American Heart Association—Maryland Affiliate
3. American Lung Association of Maryland
4. Anne Arundel Medical Center
5. Baltimore County General Hospital
6. Baltimore County Medical Association
7. Baltimore City Medical Society
8. Bon Secours Hospital
9. Carroll County General Hospital
10. Chestnut Lodge Hospital
11. The Children's Hospital and Center for Reconstructive Surgery, Inc.
12. Church Hospital
13. Community Psychiatric Clinic, Inc.
14. Crownsville Hospital Center
15. Doctors Community Hospital
16. Dorchester General Hospital
17. Fallston General Hospital
18. Franklin Square Hospital Center
19. Frederick Memorial Hospital
20. Good Samaritan Hospital
21. Greater Laurel-Beltsville Hospital
22. Harbor Hospital Center
23. Harford Memorial Hospital
24. Holy Cross Hospital
25. Howard County General Hospital, Inc.
26. J. Lawrence Kernan Hospital, Inc.
27. Liberty Medical Center, Inc.
28. Maryland General Hospital
29. Maryland Hospital Education Institute
30. The Maryland Psychiatric Society, Inc.
31. Maryland Radiological Society
32. Maryland State Black Psychiatrists' Association
33. Medical Mutual Liability Insurance Society of Maryland
34. The Memorial Hospital and Medical Center of Cumberland, Inc.
35. Memorial Hospital of Easton, Maryland
36. Mercy Medical Center
37. Montgomery County Department of Addiction, Victim, and Mental Health Services
38. Montgomery General Hospital
39. Monumental City Medical Society
40. Office of Occupational Health Services/National Security Agency
41. The Neurology Center, P.A.
42. North Arundel Hospital
43. Peninsula Regional Medical Center
44. Potomac Ridge Treatment Center
45. Prince George's County Medical Society
46. Prince George's Hospital Center
47. Sacred Heart Hospital
48. St. Agnes Hospital
49. St. Joseph Hospital
50. Shady Grove Adventist Hospital
51. Sheppard & Enoch Pratt Hospital
52. Sinai Hospital
53. Southern Maryland Hospital, Inc.
54. Spring Grove Hospital
55. Springfield Hospital Center
56. Suburban Hospital
57. Taylor Manor Hospital
58. Union Memorial Hospital
59. University of Maryland Health Center

❑ ❑ ❑

Committee on Drugs

Mr. President and Members of the House of Delegates:

The Medical and Chirurgical Faculty bylaws state that the Committee on Drugs shall be "responsible for evaluating the appropriateness of prescribing controlled dangerous drugs and shall work closely with appropriate governmental authorities in controlling the abuse of controlled dangerous substances by physicians."

The committee has a specific, statutorily mandated role in the process by which physicians receive approval to prescribe amphetamines and methamphetamines. State regulations require physicians to request approval from the Division of Drug Control medical consultant for the prescribing of amphetamines. To prescribe methamphetamine, physicians must receive **prior** approval from the medical consultant. The secretary of the Department of Health and Mental Hygiene appoints the medical consultant. In 1992, as in past years, the secretary appointed the Med Chi Committee on Drugs chairperson as medical consultant.

The regulations further provide that if there is any doubt as to the validity of the diagnosis of a condition justifying the prescription of amphetamines, the documentation shall be submitted to the Med Chi Committee on Drugs by the medical consultant for that committee's review and advice. The Committee on Drugs reminds all physicians in Maryland of their responsibility to request approval from the medical consultant for the prescribing of amphetamines. Requests should be addressed to the chairperson of the Committee on Drugs at the Med Chi offices.

The committee continues to strive to maintain a balance between educating physicians about their prescribing practices and supporting discipline for those who abuse these privileges. The chairperson appreciates the continued dedication and commitment of members and staff to the education of physicians in this important aspect of their practice.

❑ ❑ ❑

DR. YOSUICO (R) SWEARS IN DR. SNYDER AS THE 1993-1994 MED CHI PRESIDENT.

Committee on Emergency Medical Services

Mr. President and Members of the House of Delegates:

The Committee on Emergency Medical Services conducted four meetings during the report period. A number of issues, to include legislative bills that have a direct impact on emergency medicine, were discussed and actions taken. Because of the magnitude and impact of some issues, monitoring must be ongoing. Major areas of significance are discussed below.

Emergency medical services funding

At the late-1992 meetings, strategies were discussed regarding the governor's 1993 budget implemented by the University of Maryland; the budget initially directed a 63% budget cut to the Emergency Medical Services (EMS) system [essentially, the Maryland Institute of Emergency Medical Services Systems (MIEMSS)]. After considerable negotiation, a favorable outcome resulted in the restoration of the EMS (MIEMSS) budget to the 1992 ($6.8 million) level; $4.3 million to be raised by the state.

The Governor's Commission on EMS

The governor appointed an EMS commission to study the mission, structure, funding, and operation of EMS in Maryland. The commission was tasked to submit its recommendations to the governor by December 31, 1992; James A. D'Orta, M.D., was appointed chairperson. The proclamation announcing the establishment of the Governor's Commission on EMS detailed the commission composition. The chairperson, on behalf of the Medical and Chirurgical Faculty, testified before the commission. Commission recommendations included a major overhaul in the operation of MIEMSS. Part of the recommendations included the creation of a Board of Emergency Medical Services to administer EMS in Maryland; the creation of an EMS Advisory Council for the EMS board; the separation of the R. Adams Cowley Shock Trauma Center from the direct control of MIEMSS and placement of the function under the control of the University of Maryland Medical System Corporation; the separation of the McMathias Research Activity; and MIEMSS being targeted to report directly to the governor. HB 1222 and SB 686 (identical in text) were drafted and submitted to the 1993 legislature. The bills were amended and passed. As of this report, the legislation has been signed by the governor.

Emergency department overcrowding

Emergency department (ED) overcrowding continues to be a concern and a monitoring issue of the committee. State and the national American College of Emergency Physicians (ACEP) reports were reviewed, and individual hospital status monitoring was conducted. ED overcrowding remains a problem because of increased use by the elderly, "dumping" of nursing home patients, homeless issues, changing practice patterns by private physicians, increasing problems in society with drugs and alcohol, the increased prevalence of AIDS (acquired immunodeficiency syndrome) and violence in the community, funding problems, and an insufficient number of hospital beds during specific times thus delaying patient admission from the ED. All these factors lead to a patient back-up, a decreased level of care, and longer waiting times for patients, among other problems. Because of this, a letter was written to the Maryland Hospital Association to encourage it to alert hospitals to the growing overcrowding problems and to take steps to address preventive measures for the winter of 1993. The problems cannot be fixed easily. The overcrowding issue will continue to be addressed at future committee meetings, probably for several years.

Health Care Financing Administration audits

The committee addressed the concerns of emergency physicians being audited by the Health Care Financing Administration (HCFA). Affected emergency physicians objected to the scope and inappropriateness of the audits. Audits are being conducted in a harassing and demeaning manner. The committee recommended that Med Chi write HCFA and request the correction of the audit process.

Survey of component medical societies

The committee surveyed all component medical societies to ascertain the impact of the MIEMSS budget cuts. The survey yielded a response of almost 70%. Nearly all respondents reported that funding cuts would affect staffing, equipment purchases and maintenance, patient transport, communications, and certification and training. In view of the governor's appointment of the EMS commission, this issue was tabled for later review, if appropriate.

Legislative issues having an impact on emergency medicine

The major legislation having an impact on EMS was discussed previously under the "Governor's Commission on EMS." HB 1280 and HB 1359, health care reform bills, were passed by the legislature. As of this report, HB 1222, HB 1280, HB 1359, and health maintenance organization (HMO) legislation have been signed by the governor.

Assaults on physicians

The committee reviewed assault incidents of physicians in private offices as reported by the Baltimore City Medical Society. A checklist of security measures was prepared and accepted for publication by Med Chi to assist physicians in ensuring that adequate building and office security is in place.

Management of chemical agent incidents

The committee stayed current on the development of a training program to provide physicians, nurses, hospital administrative staff, and pre-hospital care providers the latest information on the management of chemical agent casualties. Med Chi has arranged, in conjunction with the Maryland Chapter of ACEP and the Centers for Disease Control and Prevention (CDC), to offer the program at the 1993 Med Chi annual meeting.

Other issues reviewed and discussed include

- ✦ Maryland Access to Care program
- ✦ Legislation addressing
  - ✧Drunk and Drugged Driving; Emergency Response Restitution
  - ✧Fire, Rescue, and EMS Personnel—Bill of Rights
  - ✧Medevac—Nonresidents; Reimbursement for Transportation Costs
  - ✧Vehicle Laws: Passengers on Motorcycles—Age Restriction
- ✦ Domestic violence
- ✦ DNR (do not resuscitate) orders proposed for legislation
- ✦ ED observation units
- ✦ Emergency medicine article for *Maryland Medical Journal*
- ✦ Impact of COBRA law as basis for recent attorney suits

It has been my pleasure to serve Med Chi as the chairperson of the Committee on Emergency Medical Services.

Anne Salmon-Barone, M.D.
Jeannine L. Saunders, M.D.
Michael A. Stang, M.D.
Harold Sussman, M.D.

❑ ❑ ❑

Finance Committee

Mr. President and Members of the House of Delegates:

During the 1992-1993 year, the Finance Committee met several times to review the 1992 interim financial statements. The 1992 audited financial statements are located in the Supplementary Reports section of this journal.

With the revisions made to SB 654, Med Chi was able to use the $50 physician licensure assessments to fund both physician rehabilitation and peer review activities beginning October 1, 1992. The rationale for this change is that peer review services all physicians in Maryland, not just Med Chi members. We think this is a positive change.

The committee met several times with staff to develop the 1993 budget for Med Chi's general fund and physician rehabilitation/peer review. The budgets were presented to Council in November 1992, according to the bylaws. Council referred the budgets to the Executive Committee since critical information was not obtainable until lobbying arrangements were finalized. The Executive Committee approved the 1993 budgets at its January 1993 meeting. The 1993 budget follow the audited financial statements in the Supplementary Reports section of this journal.

Committee members

Chairperson Paul A. Stagg, M.D.
Sheldon B. Bearman, M.D.
Albert L. Blumberg, M.D.
Joel L. Falik, M.D.
Abdolhamid Ghiladi, M.D.
Allan D. Jensen, M.D.
J. David Nagel, M.D.

❑ ❑ ❑

Focused Professional Education Committee

Mr. President and Members of the House of Delegates:

The Focused Professional Education Committee offers evaluation and focused medical education to physicians with defined deficits in their practices. The committee provides a resource for those physicians to improve their care of patients.

The committee receives referrals from peer review organizations, hospitals, licensing boards, and individual physicians. Referrals have also come from surrounding states, including New Jersey, Rhode Island, and West Virginia. Each evaluation results in an extensive report, focusing on the deficits in a physician's practice, assessing the physician's needs, and addressing those needs through specific educational recommendations.

In the past year, the committee has worked with Franklin Square Hospital Center to provide focused education courses in a community hospital setting. The committee has also begun work on a course in medical recordkeeping, which it will offer several times a year at Med Chi.

Committee members

Chairperson Edward J. Kowalewski, M.D.
Pablo E. Dibos, M.D.
Ronald J. Cohen, M.D.
Mesbah U. Dowla, M.D.
Kevin S. Ferentz, M.D.
Michael J. Richardson, M.D.
Elliece S. Smith, M.D.

❑ ❑ ❑

Committee on Hospital Medical Staffs

Mr. President and Members of the House of Delegates:

The Committee on Hospital Medical Staffs discussed numerous items of importance to the present circumstances of, and future policies involving, hospital medical staff activities. The committee submitted a resolution to the American Medical Association (AMA) Hospital Medical Staff Section (HMSS) Assembly at the December 1992 interim meeting. This resolution expressed great concern about the depletion in health insurance agency financial reserves due to ill-advised commercial investments. The resolution asked that the AMA adopt, as policy, a resolution stating that if money is going to a nonprofit entity that is supporting patients, then that money should stay for patient care or support and not be placed in for-profit ventures unless the nonprofit entity obtained permission from a state regulatory agency.

The involved reference committee at the AMA HMSS heard much testimony on the possible effects of such a policy and referred the resolution to the HMSS Governing Council for consideration and report to the section's summer 1993 assembly. After reviewing the matter, the Governing Council's conclusion was that, based on current IRS (Internal Revenue Service) requirements, federal initiatives to tighten enforcement of the internal revenue code and regulations, safe harbor rules, and other activities, the types of abuses discussed in the Maryland resolution were being addressed and no further state regulation was needed. The Governing Council's report, which was accepted by the HMSS Assembly at the annual session, also recommended that appropriate investments in for-profit subsidiaries can further legitimate health care objectives and that requiring pre-approval by a state agency could delay, or even prevent, many worthwhile projects.

Both the present and past chairpersons of the Med Chi Committee on Hospital Medical Staffs testified in support of HB 1430 at the hearing of the Maryland House Environmental Matters Committee in March 1993. This measure would have prohibited hospitals from refusing privileges to physicians, or from terminating privileges currently held by physicians, based solely on economic grounds, and would have required arbitration, under the terms of the Maryland Uniform Arbitration Act, of all disputed privilege decisions between physicians and hospitals. Unfortunately, this important bill did not survive consideration by the House Environmental Matters Committee, and thus remains as unfinished business requiring future priority as a matter of urgency.

The Committee on Hospital Medical Staffs meets regularly and welcomes suggestions and requests for consideration of all topics related to hospital medical staffs.

❑ ❑ ❑

Immunizations and Infectious Diseases Subcommittee

Mr. President and Members of the House of Delegates:

The Immunizations and Infectious Diseases Subcommittee was very active during the 1992-1993 year. Continuing its efforts to keep physicians and their office staff informed about the new Occupational Safety and Health Administration (OSHA) regulations, the subcommittee offered half-day seminars for those in physicians' offices who were going to train office personnel on the OSHA regulations. These training seminars were offered on six occasions at the Med Chi building. Because two county medical societies requested that the seminar be offered at local hospitals to accommodate the number of individuals interested in attending, the seminar was given in Talbot County and Charles County. The interest generated by this topic prompted the subcommittee to sponsor an OSHA seminar at the semiannual meeting in Ocean City in September 1992. The seminars were conducted by Robert J. Ancona, M.D., subcommittee chairperson; Diane Dwyer, M.D., chief, Center for Clinical Epidemiology, Department of Health and Mental Hygiene (DHMH) and a subcommittee member; and Roseanne M. Matricciani, R.N, J.D., Med Chi's chief operating officer.

An issue brought to the subcommittee's attention early in the year concerned the distribution of vaccine information pamphlets to adults who receive immunizations. Because adults receiving vaccines were not being provided with the pamphlets, the subcommittee supported distribution of a letter from DHMH to hospital administrators alerting them to this issue. The subcommittee recommended, and it was approved, that the information also appear in the *Maryland Medical Journal (MMJ)*.

During two subcommittee meetings, the members reviewed DHMH's immunization initiatives, and discussed a national grant to provide health care to underserved areas. The subcom-

Joseph Snyder, M.D., poses with his daughter Lee, wife Madrian, and daughter Lori at the Presidential Banquet.

mittee also discussed distribution of vaccination information to physicians' offices; the subcommittee will be pursuing this issue in the coming year.

With the passage of child wellness legislation, which became effective October 1, 1992, and was being phased in over a period of one year due to differences in annual renewal dates, subcommittee members recommended that information about coverage for these services be forwarded to the appropriate physicians. This was accomplished through a memorandum from Jose M. Yosuico, M.D., president.

Another issue addressed by the subcommittee concerned use of a system to track childhood immunizations. The Arkansas system, which tracks every child and provides up-to-date immunization information, was reviewed. DHMH is currently investigating the type of tracking system that would be beneficial for Maryland children. Discussions continue on this subject.

With the passage of HB 388, the subcommittee discussed the requirement that a universal precautions sign be posted in every physician's office. Review of the proposed sign prompted suggestions that the wording appearing at the bottom of the sign be revised. These suggestions were forwarded to the AIDS Administration.

The subcommittee also reviewed information and guidelines from the Centers on Disease Control and Prevention concerning the HIB (*Hemophilus influenzae,* type B) vaccine, pneumococcal vaccine, and HIV (human immunodeficiency syndrome) infection and expanded AIDS surveillance case definition for adolescents and adults.

The subcommittee thanks all the physicians and office staff who attended the OSHA seminars. They provided the subcommittee with helpful input and generated questions that served as a basis for many of the discussions during the seminars.

Committee members

Chairperson Robert J. Ancona, M.D.
Timothy F. Doran, M.D.
James P. Richardson, M.D.
Mathuram Santosham, M.D.
Robert E. Yim, M.D.

Advisory members

Diane Dwyer, M.D.
Margaret Rennels, M.D.

❑ ❑ ❑

Infant, Child, and Adolescent Health Subcommittee

Mr. President and Members of the House of Delegates:

The Infant, Child, and Adolescent Health Subcommittee was reactivated during the 1992-1993 year with eight new members. As the first order of business, the subcommittee reviewed its charge and discussed initiatives that prior sub-committee members had implemented.

With the knowledge that the subcommittee had been asked to participate in the Healthy Start Project, the subcommittee invited Lillian R. Blackmon, M.D., to discuss various aspects of this project and how the subcommittee would interface with the Healthy Start Project initiatives. Dr. Blackmon discussed several facets of the Healthy Start Program and explained the subcommittee's involvement in infant mortality reviews that would be conducted under the umbrella of the Med Chi's medical review committees. The subcommittee, working closely with the Maternal Welfare Subcommittee, will take part in reviewing medical record abstracts to address systems failures, global concerns, and educational concerns. A report will be presented to a Med Chi subcommittee with broader Healthy Start Project representation. This aspect of the project will be managed by Med Chi and will be funded by the Healthy Start Program.

Another issue discussed by the subcommittee involved the Department of Health and Mental Hygene (DHMH) survey concerning birth and death certificates. The subcommittee reviewed birth, fetal death, and induced termination of pregnancy certificates. The subcommittee recommended that information concerning the hospital of birth of an infant (if less than one year of age) and all names an infant has been known by should appear on the birth certificate. This information was forwarded to DHMH.

Issues surrounding "gray-area" children were discussed. Initiatives by the Maryland Chapter, American Academy of Pediatrics, to provide access to care for gray-area children were reviewed. The subcommittee also discussed DHMH's initiative to obtain a Health Care Financing Administration waiver in order to extend services to these children through the Medical Assistance Program. Immunization concerns and delivery of care to rural areas were also addressed. The subcommittee will follow these initiatives in the coming year.

❑ ❑ ❑

Legislative Committee

Mr. President and Members of the House of Delegates:

The 1993 session of the Maryland General Assembly began at a time of fundamental change in the way Med Chi addresses legislative issues. Because of this, and because of regrettably unfavorable public perceptions and attitudes toward the practice of medicine in general, as reflected in the preceeding year's election campaigns, this legislative session was a time of great risk for Med Chi and Maryland physicians, with little realistic prospect of any beneficial outcome. Nevertheless, Med Chi emerged from the 1993 session of the Maryland General Assembly with an overall record of solid success in its legislative representation of Maryland physicians.

At the beginning of the 1993 session, Dr. Martinez and Med Chi staff developed organized, democratic procedures to evaluate pending legislation in the Legislative Committee. A synopsis and analysis of each legislative item of potential Med Chi interest was submitted to the committee for review. After the committee had had a chance to evaluate each bill, the committee's findings were disseminated by means of weekly *Legislative Action* newsletters, which set forth a synopsis of each bill and the committee's action on it. The *Legislative Action* newsletter also listed a calendar of upcoming hearings before Senate and House committees, so that interested physicians could participate as witnesses.

The Legislative Committee reviewed more than 225 pieces of legislation and so was able to make Med Chi's position known and felt in Annapolis. To this end, more than 55 physicians, as well as Dr. Martinez; Angus Everton, general counsel; and Mr. Mandel, testified at committee hearings. Written testimony was submitted on more than 100 proposed bills.

For the most part, these efforts brought gratifying results. The RAP (radiologists, anesthesiologists, and pathologists) bills (HB 993 and SB 704), which would have imposed Health Services Cost Review Commission (HSCRC) regulation on hospital-based physicians, were turned aside in their respective committees. SB 824, which would have submitted all physician and nonhospital medical services to HSCRC regulation, was defeated as well. HB 909 and SB 573, which would have prohibited physical therapists from practicing as employees of physicians altogether, were similarly defeated in committee. Various items of reverse tort reform legislation supported by plaintiffs' trial lawyers, including the broadening of punitive damage liability, adoption of comparative negligence, and elevation of nonpecuniary damage caps, were similarly defeated in committee after Med Chi representatives testified against these bills.

HB 1522, which would have repealed a hard-won provision of the Health Occupations Article allowing physicians to delegate simple x-ray duties to trained office personnel, was defeated in committee primarily because of the diligent efforts of Mr. Troisi and Ms. Matricciani, despite influential support for the bill by a delegate with links to the radiology technologist community.

After the physician rally on March 18 in front of the State House, Med Chi found itself directly involved in the debate surrounding health system reform legislation. Med Chi's interactions with members of the Senate Finance Committee resulted in removal of fee cap provisions from the legislation. More important, Med Chi's legislative representatives were sought out by Delegate Casper Taylor to participate actively in creating the final product—HB 1359. Through this involvement, HB 1359 was stripped of its physician fee cap provisions, for which was substituted a payment system—applicable to all health care practitioners—that permits the market to determine the final price of health care services except under extraordinary circumstances. This bill includes provisions that encourage development of practice parameters for specific procedures, and it establishes a community standard for expert testimony in malpractice cases, which may discourage the indiscriminate use of "hired gun" expert testimony.

Med Chi representatives were also involved in the passage of legislation that will restrict the ability of health maintenance organizations (HMOs) to dictate unreasonable fee terms for physicians not under contract with them but who provide services to HMO patients, particularly in the emergency room context. Med Chi was also directly involved with the preparation and enactment of the Health Care Decision Act, strengthening and broadening the scope of the present living will law,

and clarifying the law in respect to medical powers of attorney and other advance medical directives.

In addition, Med Chi also had input into a new professional corporation law, that substantially modernizes the corporate form of professional practice. And, while Med Chi was not able to prevent enactment of the self-referral bill (HB 1280), a grandfather clause was added to the bill in the Senate Economic and Environmental Affairs (EEA) Committee that will delay the operation of this bill as it affects existing practices until March 1997, in order to permit the completion of a study to determine whether this sort of legislation is necessary at all.

Finally, through diligent efforts, the Legislative Committee was able to preserve funding for Med Chi's peer review and physician rehabilitation programs, against a strong legislative attack that would have divested Med Chi of these programs entirely, or else would have cut their funding in half, rendering it difficult to continue the programs in their present form.

There remains much to be done. Med Chi must keep close track of appointments to the new seven-member Health Care Access and Cost Commission (HCACC) created by HB 1359; it is in the vital interest of Med Chi, physicians, patients, and health care consumers that those appointed to this commission are the most enlightened and capable candidates available. It is also essential that the self-referral study to be performed under HB 1280 be carried out fairly to ascertain whether indeed there are utilization and cost containment problems in this area. Parity for mental health coverage under this bill will be a critical area. Finally, all this new legislation must be studied in-depth so that, if appropriate, new legislative activity may be proposed within a reasonable time prior to the opening of the 1994 legislative session.

House Bill 1359—Health Care and Insurance Reform

HB 1359, the Health Care and Insurance Reform Bill, evolved through a tortuous procedure in both the House of Delegates and the Senate. It initially appeared as HB 286, entitled "Health Insurance—Managed Competition." HB 286 was a complicated bill establishing a Health Insurance Purchasing Commission that would break the state down into four regional areas. Each area would have its own regional advisory board empowered to enter into contracts with insurance carriers to provide health benefit plans to persons in Maryland, with an emphasis on plans issued through employers (not limited to small employers). The Health Insurance Planning Commission was also empowered to establish a unified health care database to enable it to make the necessary cost and benefit decisions in determining the type of health insurance that would be offered by participating carriers.

About mid-February, HB 286 sank without a trace and was replaced by HB 1359, introduced by the Speaker of the House and the Economic Matters Committee. This bill would create a new subtitle in the insurance code governing health insurance; establish community rating; guarantee issue of health benefit plans; limit pre-existing condition provisions; and establish health plan portability. HB 1359, as originally enacted, also would have created a Health Care Benefit and Data Commission that would regulate insurers covered under the plan and collect data from health care providers to facilitate its decision-making process.

In these forms, as of February 15, 1993, neither HB 286 nor HB 1359 contained anything of serious concern to the medical profession. Med Chi, therefore, essentially adopted a wait-and-see attitude regarding this legislation. Med Chi was somewhat skeptical of the data collection provisions of the bill, but was also favorably inclined toward the concept of community rating, prohibition of pre-existing condition exclusions, and guaranteed issue.

A series of work group meetings were held during the latter part of February and early March in the House Economic Matters and House Environmental Matters Committee on HB 1359. Med Chi representatives attended all but one of these meetings; one meeting was missed because advance notice was not given.

Around the beginning of March, there was a fundamental change in HB 1359's orientation, and one that was generated from within the House Economic Matters and House Environmental Matters committees. The portions of the bill creating a universal health care insurance package were amended to apply only to small employer group health insurance covering employees of businesses having from 2 to 50 employees. The Health Care Benefit and Data Commission, which was to consist of 11 members including a physician and hospital representative, was removed from the bill altogether, and a Medical Care Data Review Commission was created in its place, to consist of 7 members, none of whom had to be health care providers. This commission was now empowered not only to formulate a uniform set of health insurance benefits, but also to collect detailed data on the operations of all physicians and pharmacists practicing in Maryland, and, most important, the commission was required to create a payment system setting up a fee schedule that would cap physicians' (and only physicians') fees by July 1, 1996.

Although HB 1359's provisions at this stage were mandatory as to the regulation of physician fees, the bill did not require small employers to purchase the uniform set of benefits provided under the bill's plan, nor did it require insurers to offer those benefits unless the insurers offered health coverage to small employers generally.

The fee schedule portion of HB 1359 was introduced as an amendment late in the afternoon of the last day the committee considered the bill; the amendment was incorporated into the

bill approximately 20 minutes later, without any opportunity for Med Chi or physician input.

Med Chi and other specialty society groups mobilized strong opposition to HB 1359 in this form. On the Senate side, the bill had been assigned to the Senate Finance Committee. One influential senator threatened in the press to come forward with alternative legislation that was even more offensive to physicians.

Proposed amendments were worked on under tight security. No person other than Senate Finance Committee members and staff had any information as to the provisions.

The Senate Finance Committee held hearings on HB 1359 that were heavily attended by representatives from Med Chi and various specialty societies. Shortly thereafter, a well-attended rally of physicians was held in front of the State House. This rally generated substantial publicity regarding the essentially unfair and adverse nature of HB 1359 as it applied to physicians. Med Chi, with strong assistance from some component societies, undertook a sweeping telephone campaign, which literally kept the telephones of Senators O'Reilly and Miller occupied for several days. Hundreds of physicians called their senators and delegates to complain of the provisions in HB 1359. At this time, Senator O'Reilly came forth with his proposed amendments to his own health care reform bill (SB 349), which had begun its own life as an innocuous health insurance bill, but which, as proposed to be amended by Senator O'Reilly, would also have imposed mandatory fee schedules on physicians and other health care providers in Maryland.

The proposed amendments to SB 349 would have divided it into five major parts, including (1) HMO reform; (2) a Medical Care Data Review Commission; (3) a Practice Parameters and Risk Management Protocol Commission (4) a Global Health Care Budget Commission; and (5) small employer health insurance reform. These amendments were designed, in large part, to shift a substantial body of the health insurance consumer population away from traditional health insurers to HMOs. As initially drafted, the amendments contained two potential fee control systems, both within the section described as the Global Health Care Budget Commission. This behemoth of a bill would have been extremely expensive to operate; four separate commissions were created by the bill, including one to administer the practice parameters and risk management protocols. This commission, which was to be heavily weighted with physicians, was designed to create practice parameters and risk management protocols, which, when approved by the commission, would be subject to admission into evidence as affirmative defenses in malpractice actions.

At the same time that Senator O'Reilly issued these proposed amendments to SB 349, Senators Paula Hollinger and American Joe Miedusiewski introduced a separate set of amendments to SB 349. These amendments were far less intrusive than those proposed by Senator O'Reilly; they provided for a Data Review Commission, an experimental Practice Parameter and Risk Management Protocol Commission, and health insurance reform to include community rating and pre-existing condition prohibitions.

An intense period of lobbying by Med Chi and other groups followed. Ultimately, a majority of the Senate Finance Committee members were found to be opposed to the fee schedule provisions of SB 349, and the provisions were taken out. A Health Care Access and Cost Commission was created in this bill to collect and analyze data and develop a uniform set of effective benefits to be included in a comprehensive standard health benefit plan. Data would be collected by requiring all health care providers to submit, electronically, payment claims and "any other information reasonably related to the medical care database" through certain "licensed claims clearing houses" in a standard format. These licensed claims clearing houses were to pass the claims on to the payers and maintain a central database of the information collected.

A "practice parameter and risk management protocol" section of SB 349 was synthesized from the two sets of amendments offered by Senator O'Reilly and by Senators Hollinger and Miedusiewski. This provision contained the affirmative defense language that had been included in the original amendments, and which had initially been set forth in experimental legislation, proposed by emergency physicians through their legislative representative, that would have set up this procedure initially on a voluntary basis.

A small employer health insurance reform section was included in SB 349. The section was similar in many respects to that set forth in HB 1359, except that there was no trigger provision to require contingently that the insurance reforms apply to all health insurance if a certain amount of small employer group health insurance had been sold. Furthermore, in an uncodified section of SB 349, an advisory commission was set up to study the feasibility of health care provider fee controls.

SB 349 passed the Senate with a lopsided margin in its favor, just as HB 1359 had initially passed the House almost unanimously. Both bills were returned to the House Economic Matters Committee. At this point, Delegate Casper Taylor, chairperson of the House Economic Matters Committee, called a meeting of physicians and their legislative representatives, including Med Chi's general counsel. At this meeting, Delegate Taylor expressed his belief that the House had been precipitous in requiring a fee schedule in the original HB 1359, but he also indicated that the sense of the House was that it intended to include some sort of discretionary control mechanism to be applied in the event that certain health care providers' fees were found to be outside the reasonable market range and could not be brought into line voluntarily. He

recommended a system whereby the commission collecting data (which by now had gone through a series of three or four different names) could review the collected data, and if the commission found an area of payment that was out of line, the commission could hold hearings and enact regulations to control fees only in the area where a problem had been found.

One of the four physicians present at this meeting suggested that such a system might be feasible if it also included a mechanism for discussion between the affected specialty group and the commission before any control mechanism was instituted. Delegate Taylor assented to this concept. Med Chi's general counsel asked whether such a system could be used to raise physician fees if it were found that a specialty group was being underpaid, as in the case of emergency physicians dealing with noncontracted HMOs. Delegate Taylor assented to this concept as well. It was further suggested by the general counsel that a provision for qualified state anti-trust immunity be included in the bill if any voluntary discussion of fees was to be undertaken between the commission and a private specialty society; Delegate Taylor agreed to this concept also.

During the succeeding days, more than a dozen affected interest groups submitted proposed amendments to HB 1359/ SB 349. During this period, it was unknown which of these bills would be chosen as the vehicle to carry health system and health insurance reform forward. Further, there was no word as to which of the scores of amendments would be accepted.

Ultimately, HB 1359 was chosen as the final bill. It was submitted to Conference Committee to resolve the substantial differences between the House and Senate versions. The Conference Committee consisted of Senators O'Reilly, Simpson and Young, and Delegates Taylor, Alexander, and Cummings, with Delegate Virginia Thomas participating as an observer from the House Environmental Matters Committee. The Conference Committee held a series of open meetings during the first week of April, but **no** outside participation at these hearings was permitted. Ultimately, the Conference Committee came up with a final draft. It passed the House with only token opposition; in the Senate, it passed with a majority of 44 in favor, 2 opposed.

The ultimate product is well described in the HB 1359 analysis issued by Delegate Taylor. The description of the payment system is significant:

> The commission must develop and implement a payment system by January 1, 1995. The payment system provides a *framework* for the determination of the ultimate price for health care services. *The market determines the final price of a health care service.*
>
> The payment system will be based on the following factors: The practitioner's resources (e.g., overhead, experience, expertise); the value of the service (e.g., complexity and other factors); and a conversion modifier. The ultimate price of the service will be arrived at by multiplying the numeric value of these three factors. *The conversion modifier is the key to setting the dollar value of a service.*
>
> The commission will determine the numeric value for practitioner's resources and value of the service by CPT [current procedural terminology] code. *The market (practitioners and payers) will determine the numeric value of the conversion modifier.*
>
> (Emphasis in original)

Generally speaking, the bill sets forth a small group market reform. This small group market reform will automatically become applicable to all health insurance in Maryland if one of two things happen: if 60% of the population under 65 years of age receives health care coverage through an insurer or HMO, or if the federal Employee Retirement Income Security Act is amended to allow states to control employee health benefit plans.

As a cost-containment strategy, the bill requires health insurers and HMOs to submit annual reports to the insurance commissioner. The insurance commissioner may require each carrier to file new rates if the carrier's loss ratio is below 75% or if the expense ratio exceeds 20% for commercial insurers or HMOs, or 18% for nonprofit health service plans. Basically, this is profit controls on Maryland health insurers.

There is a commission to establish practice parameters under this bill. The practice parameters that ultimately would be established would not be admissible in court for any reason. Medical malpractice reform is accomplished in this bill by changing the rule as to expert testimony on standards of care from the "national standard" rule to the "similar community" rule. As discussed in Delegate Taylor's analysis:

> In any action for damages in a medical malpractice case, the health care provider is not liable for the payment of damages unless it is established that the care given by the provider is not in accordance with the standards of practice among members of the same health care profession with similar training and experience situated in the same or similar communities.

As discussed above, the bill will create a medical database to include information on health services rendered by all health care practitioners. The bill will also adopt a standardized system for processing claims, using HCFA (Health Care Financing Administration) form 1500, which has already been designated by Maryland statute as the standard claim form. The commission will analyze data and annually publish the total variations in fees and utilization on a statewide basis and by health service area.

Because of the subject matter's complexity and the bill's broad scope, it is a rough-hewn instrument. A great deal will depend on the good faith and intellectual caliber of those picked to serve on the commission; moreover, a great deal of fine tuning can be expected during the following legislative sessions to make this bill workable. Manifestly, some deadlines for operations of the commission are going to be unworkable and will have to be extended. It will behoove Med Chi and interested physicians to scrutinize closely the appointments to, and activities of, this commission in the coming months and years.

House Bill 1260—Self-referral

HB 1280, the self-referral bill, was offered last year in the House of Delegates in a form similar to that ultimately passed

this year, as HB 1374 of the 1992 session. Med Chi officially supported HB 1374 during the 1992 session on advice of the then-legislative representative, who indicated to both the Legislative Committee and the Executive Committee of Council that the bill was essentially in harmony with the ethical position of the American Medical Association (AMA) Council on Ethical and Judicial Affairs on this issue. When Med Chi later reached a determination that HB 1374 was not altogether consistent with the AMA's ethical position, Med Chi took a position that, although it supported the ethical opinions of the AMA in this regard, it similarly would follow the AMA lead to the effect that these were ethical considerations and not the appropriate subject of legislation. In any event, when HB 1280 was proposed and submitted in the 1993 session, Med Chi opposed it.

HB 1280, like last year's HB 1374, was introduced by Delegate Ronald Guns, chairperson of the House Environmental Matters Committee, along with other members of that committee. Because of this, there was a bias in favor of the bill in that committee. Nevertheless, the bill was held up in committee until mid-March when the chairperson was finally able to get enough votes to pass it out of committee.

When the bill was passed by the House, it included uncodified language holding that the anti-self-referral provisions of the bill would not apply to "a neurology group practice that contains three or more full-time radiologists who are partners in a group practice with neurologists which was in existence on or before December 30, 1988, provided that the neurology group practice does not expand its facilities beyond the number of locations in existence in the state on January 1, 1993," or to "a health care practitioner who has a beneficial interest in a cardiac rehabilitation facility who entered into a written affiliation agreement for that facility on or before December 30, 1988,. . ." with certain further provisos.

These two uncodified exceptions to the operation of the statute were stricken almost immediately from the bill when it reached the Senate EEA Committee; moreover, the EEA Committee introduced language requiring direct supervision in the event that a health care practitioner with a beneficial interest in a health care entity referred a patient to that health care entity for health care services or tests, if the services or tests were personally performed by or under the direct supervision of the referring health care practitioner.

The Senate EEA Committee added two amendments to the bill that would delay its impact and could potentially generate grounds for repeal. First, the committee added an amendment that would delay implementation for three years as to facilities and practices currently in existence. Since the House bill as originally drafted contained a one-year's grace period for facilities to divest themselves of instruments and property that could not be used under the bill's self-referral prohibitions, this granted a total of four years of divestiture time.

Moreover, a second uncodified section of the bill provided that the Institute for Governmental Service and the William Donald Schaefer Center for Public Policy should conduct jointly a study evaluating the extent to which Maryland health care practitioners have beneficial interests in, or compensation arrangements with, health care entities to which they refer patients. This study is also to compare the frequency of referral and the cost of services by practitioners who refer patients or entities in which they have beneficial interests or in which they have compensation arrangements with the frequency of referral and the cost of services by practitioners who do not have beneficial interests in or compensation arrangements with the entities to which they refer patients. Presumably, if this study shows that self-referral is not a serious utilization or cost problem, the more onerous provisions of the bill could be repealed.

The bill made its way back to the House Environmental Matters Committee, from which it was sent to Conference Committee as well. The three-year grandfather provision was deleted and redrafted so that the bill would not take effect for the purpose of requiring divestiture of existing property and modification of existing practices until March 1, 1997. Meanwhile, the study provisions were left intact.

The bill itself is a clumsy piece of legislation. Although it generally requires that health care practitioners may not directly or indirectly refer patients to a health care entity in which the health care practitioners or their immediate family own a beneficial interest, or with which there is a compensation arrangement, and although it forbids billing under circumstances where such a referral is made, there are so many exceptions to this statute that its practical effect may be less significant. The provisions of the law, for example, do not apply to

- health care practitioners when treating HMO members if the health care practitioners do not have a beneficial interest in the health care entity;
- health care practitioners who refer patients to other health care practitioners in the same group practice as the referring health care practitioners;
- a health care practitioner with a beneficial interest in a health care entity who refers a patient to that entity for health care services or tests, if the services or tests are personally performed by him or her, or under his or her direct supervision (and direct supervision, under the law, simply means physical presence on the premises where the health care services or tests are performed and availability for consultation within the treatment area);
- referral of in-office ancillary services or tests (not

including magnetic resonance imaging, radiation therapy or computed tomography services) that are personally furnished by health care practitioners in the same group practice as the referring practitioner or by individuals employed or personally supervised by the qualified referring health care practitioner, provided in the same building where a health care practitioner in the same group practice furnishes services, and billed by the group practice;

- a health care practitioner who, upon determination of the secretary of the Department of Health and Mental Hygiene (DHMH) and the Health Resources Planning Commission, is determined to provide a health care service needed "to ensure appropriate access for the community to services provided at the health care entity";
- a health care practitioner employed or affiliated with a hospital who refers a patient to a health care entity owned or controlled by the hospital, if the practitioner does not have a direct beneficial interest in it;
- a health care practitioner who has a beneficial interest in a health care entity owned or controlled by a hospital if the practitioner provides services to the patient pursuant to a referral by a health care practitioner who does not have a beneficial interest, or the health care practitioner refers a patient to the facility and personally performs or supervises that procedure; or
- a health care practitioner with a beneficial interest or compensation arrangement with a hospital or related institution if the beneficial interest was held on January 1, 1993, and thereafter the beneficial interest or compensation arrangement does not increase.

There is a requirement that health care practitioners providing exempt services must still post the legally required self-referral notice that presently exists in the law; failure to post this notice is now a misdemeanor. Moreover, there are several lengthy provisions that expressly prohibit insurers from paying claims based on prohibited self-referred services.

House Bill 462 and Senate Bill 701/House Bill 1203—HMO-related legislation

The Maryland General Assembly enacted important legislation restricting the power of HMOs to "lowball" noncontracting physicians, particularly in an emergency room context, who render care to the HMO's patients. HB 462 provides that a HMO must pay a noncontracting physician at the rate billed or at the usual, customary, and reasonable rate. In calculating the usual, customary, and reasonable rate, however, the HMO may not use Medicare, Medicaid, or Workers' Compensation payments (except for services rendered to Medical Assistance recipients) as part of any methodology used to determine a payment at the usual, customary, and reasonable rate. Furthermore, "on request of the health care provider [the HMO] shall disclose the methodology used to determine the amount of payment." This disclosure requirement can be used by the physician to enforce appropriate usual, customary, and reasonable payments by HMOs through the insurance division, the court system, or the Health Care Access and Data Commission, after the latter is up and running under HB 1359.

SB 701 and HB 1203 dealt with the definition of an emergency in an HMO context. SB 701 provided that

> Emergency services means those health care services that are provided in a hospital emergency facility after the sudden onset of a medical condition that manifests itself by symptoms of sufficient severity, including severe pain, that the absence of immediate medical attention could reasonably be expected by a prudent layperson, who possesses an average knowledge of health and medicine, to result in
>
> - placing the patient's health in serious jeopardy;
> - serious impairment to bodily functions; or
> - serious disfunction of any bodily organ or part.

By contrast, HB 1203 defined emergency services as follows:

> Emergency services means those health care services that are provided in a hospital emergency facility after the sudden onset of a medical condition that manifests itself by acute symptoms of sufficient severity, including severe pain, that the absence of immediate medical attention could reasonably be expected to result in
>
> - placing the patient's health in serious jeopardy;
> - serious impairment to bodily functions; or
> - serious dysfunction of any bodily organ or part.

SB 701 was designed to ensure that whether an emergency exists is to be determined from a layperson's perspective, while under HB 1203, the question of whose judgment is to be applied is left open. In fact, section 3 of HB 1203 expressly stated: "In enacting the definition of 'emergency services' in section 2 of this Act without reference to the reasonable expectation of a 'prudent layperson, who possesses an average knowledge of health and medicine,' the Maryland General Assembly intended to conform the standard to the language of Public Law 99-272, April 7, 1986."

Both statutes were otherwise essentially identical. In addition to the language previously quoted, both statutes required HMOs to develop and provide specific information to all HMO subscribers and enrollees that clearly describes the procedures to be followed for emergency services, including the appropriate use of hospital emergency rooms; the appropriate use, location, and hours of operation of urgent care facilities operated by the HMO; and the potential responsibility of subscribers and enrollees for payment for emergency services or nonemergency services rendered in the hospital emergency facility where the medical condition is determined not to be an emergency. Both statutes also provide that an emergency facility may indeed collect from a subscriber or enrollee for these services in the event that they are determined not to be an emergency. This language, of course, relates to the balance

billing prohibition in section 19-710(o) of the existing HMO law under these circumstances.

Ultimately, due in large part to the efforts of Med Chi's legislative representative, Mr. Mandel, Governor Schaefer signed SB 701. That version is now the law of this state.

House Bill 993/Senate Bill 704 and Senate Bill 824—RAP bills

RAP bills were introduced in the House and Senate. These bills were defeated in committee after vigorous and organized opposition from Med Chi and its physicians. HB 993 and SB 704 were identical; they would have put hospital-based radiologists, anesthesiologists, pathologists, and emergency physicians under the regulatory control of the state's HSCRC. SB 824 went much further, and would have put all physicians and nonhospital medical services under HSCRC control. Moreover, the commission was required under this bill to "develop a statewide fee schedule for physician, diagnostic, laboratory, and nonhospital ambulatory care services." This fee schedule was to be developed after study of the Medicare resource-based relative value scale (RBRVS) with "necessary adjustments for state costs." These provisions were to have been in place by January 1, 1995, under SB 824, although an interim schedule would have been developed by October 1, 1994.

House Bill 232/Senate Bill 371—Physician rehabilitation and peer review

As originally sponsored, SB 371 was designed to strip from Med Chi the physician rehabilitation and peer review programs that currently exist and are funded by a license surcharge of $50 per physician. Med Chi mounted a strong campaign in opposition to this bill. The bill was amended to remove the offensive provisions and to restore these services to Med Chi. The bill did provide for more extensive budgetary review of the programs by DHMH through the Board of Physician Quality Assurance (BPQA); Med Chi naturally took no opposition to this scrutiny.

Having turned aside this challenge, the Legislative Committee was dismayed to learn that a similar amendment had been introduced to a previously innocuous bill, HB 232, the Departmental Corrective Bill for the BPQA. Even worse, while HB 232 stripped these provisions from Med Chi, it also diminished the amount of assessment for their operations from $50 to $25. These amendments would essentially have killed the programs, since an assessment of $25 per physician would be insufficient to support the programs. Fortunately, in the Senate EEA Committee, HB 232 was made to correspond with SB 371, also providing for the unobjectionable budgetary scrutiny contained in SB 371.

HB 232 contains other useful provisions. One specifically helpful item is that the Health Claims Arbitration Office (HCAO) no longer is required to report every malpractice claim filed against a physician in this state to the BPQA. Now, the HCAO is required to report such a claim only after "a certificate of a qualified expert is filed in accordance with [the Health Care Malpractice Claims Act]." This change will lighten the labor of the BPQA substantially, as it is understood that a substantial number of meritless claims filed with HCAO are dismissed because the plaintiff fails to file a certificate of merit. Under the new law, the BPQA will not have to investigate fruitlessly these claims. Both bills were enacted on the last day of the session.

Senate Bill 664/House Bill 1243—The Health Care Decision Act/Advance Medical Directive Act

The Maryland General Assembly devoted substantial attention to substitute health care decision making in situations involving patients in terminal conditions, persistent vegetative states, or end-stage conditions, who are unable, through extreme disability, to make these decisions themselves. These two bills, which ultimately were amended to conform with each other, substantially tightened the living will process, and further codified processes for substitute decision making in the context of medical powers of attorney, guardianship proceedings, and surrogate decision making.

Med Chi, through the good efforts of the Committee on Professional Ethics and Dr. Louis Breschi especially, was involved in the creation and passage of this legislation. Dr. Breschi and Med Chi's general counsel had an opportunity to prepare and submit approximately half a dozen amendments to the original advance medical directives and health care decision-making bills that were adopted by the House and Senate. Dr. Breschi and the general counsel worked particularly closely with Professor Diane Hoffman of the University of Maryland School of Law, and Judge John F. Fader II in the preparation of these amendments. Both Dr. Breschi and the general counsel testified orally and in writing before the committees that ultimately submitted favorable reports on these bills. Both bills made it out of their respective houses at the end of the session.

House Bill 389—Task Force to Study Health Care Professional–Client Sexual Exploitation

Med Chi had an opportunity to discuss HB 389 with its sponsors, through Delegate Teitelbaum, before the session's beginning. Med Chi supported this bill, which would create a task force to develop comprehensive strategies for preventing and reducing the incidence of sexual exploitation of clients by health professionals. Med Chi recognized early that this bill's approach was primarily educational in nature, and the bill's goal—to prevent health care provider–patient sexual encounters—is a goal Med Chi has supported consistently over the years. This particular bill sets up no punitive scheme or additional disciplinary provisions in this area, and is oriented

to all health professions. If there is a shortcoming in the bill, it is that it does not address sexual misadventures of nonhealth professionals, such as those in the legal profession; nevertheless, it is reasonable to anticipate that if the task force accomplishes anything positive, its work can be duplicated in other professional areas.

Senate Bill 176/House Bill 1297—Corporation law

SB 176 and HB 1297, both of which were enacted, substantially redraft Maryland's professional corporation law, greatly increasing the usefulness of this type of practice in Maryland. Among other things, the bills make it easier to transfer professional corporations' stock. They also make it much easier for such corporations to practice across professional and geographic boundaries.

There was one serious problem with these bills as first introduced. Both bills had inadvertently been drafted to provide that "a licensing unit shall direct the department to suspend or revoke the articles of incorporation of a professional corporation if. . . the professional corporation violates any applicable rule or regulation adopted by the licensing unit regulating a profession named in the professional corporation's articles of incorporation. . . ." This provision would have required the suspension or revocation of the articles of incorporation of any professional corporation if a member of it had violated even the most trivial rule or regulation of his or her licensing unit. Upon recommendation of Med Chi's general counsel in written and oral testimony, this provision was amended to provide that a licensing unit "may" direct suspension or revocation under these circumstances. Substitution of this discretionary language for the earlier mandatory language gives each licensing unit the power to suspend or revoke for serious infractions, but also gives it the power to forgive relatively trivial infractions.

Reverse tort reform legislation

A number of troublesome pieces of legislation were introduced by persons representing the interests of plaintiffs' attorneys. These provisions could have resulted, if enacted, in a substantial increase in malpractice insurance costs. Specifically, SB 266/HB 1094 would have substituted a **comparative** negligence standard in litigation for the existing **contributory** negligence standard. A plaintiff would have been able to recover damages in a malpractice action against his or her physician even if the plaintiff were contributorily negligent, if the contributory negligence of the plaintiff was determined to be outweighed by the combined negligence of the defendants in the eyes of a jury. Med Chi testified orally and in writing in opposition to these bills in both the House Judiciary Committee and the Senate Judicial Proceedings Committee; both bills were reported unfavorably upon in the Senate Judicial Proceedings Committee.

Several pieces of legislation, including SB 845, HB 1283, and HB 1303, were designed to raise the limits of the noneconomic damage cap in personal injury actions. Again, Med Chi, through its general counsel, testified orally and in writing in opposition to this legislation in the House Judiciary Committee and the Senate Judicial Proceedings Committee; the legislation did not make it out of committee.

Finally, an attempt was made in the Senate Judicial Proceedings Committee to introduce a bill to substantially expand the scope of punitive damage liability in Maryland, in SB 727. Med Chi opposed this bill also, and it was defeated in committee.

There was one setback in the tort reform area. The Maryland Court of Appeals, during the latter part of the legislative session, ruled that the presently existing noneconomic damage caps do not apply to wrongful death actions. The Medical Mutual Liability Insurance Society of Maryland (Med Mutual), with Med Chi support, sought introduction of a bill to correct this problem; Senator Walter Baker did introduce SB 917 to reimpose this cap. Unfortunately, while the bill was still in the Senate Judicial Proceedings Committee, Senator Baker apparently came to the opinion that it would not survive the House Judiciary Committee this year, so he withdrew it and submitted the matter for summer study. Undoubtedly, similar legislation will be introduced next year. It is the Legislative Committee's intention to actively support it.

House Bill 909/Senate Bill 573—Physical therapists

Physical therapy interests arranged for the introduction of HB 909 and SB 573, which would have essentially forbidden physicians to employ physical therapists in their practices. Med Chi's physiatrist members fiercely opposed these bills, and Med Chi supported these members in their opposition to these bills; both bills ultimately failed to make it out of committee.

House Bill 1522—Office x-rays

HB 1522, was introduced relatively late by Delegates Bishop and Pitkin. Its pupose was to repeal section 14-306 of the Health Occupations Article, *Maryland Code.*

Section 14-306 had been enacted with support last year. The section exempts from the certification requirements of the medical practice act certain office staff who perform simple x-ray duties without a license when those duties do not include a specific list of sophisticated procedures, when the individual is not employed primarily to perform these duties, and when the individual has undertaken training, approved by the Maryland Radiological Society, in performing these procedures.

Because of administrative difficulties in setting up the training programs required under section 14-306, they were

not (and are not yet) in existence, so the BPQA was required to grant several grace-period extensions during which office staff could perform these x-ray procedures without the statutorily mandated training.

Medical radiation technologists' interests saw an opportunity to repeal section 14-306 during this delay, so that they could secure for themselves the exclusive right to perform these office x-ray duties themselves. Enactment of HB 1522 would have worked a hardship on physicians and their patients covered by Section 14-306. Med Chi promptly took a position of opposition to this legislation.

There is no question that HB 1522 would have been enacted, and section 14-306 would thereby have been repealed, but for the diligent efforts of Mr. Troisi and Ms. Matricciani. Work sessions were held in the House Environmental Matters Committee, personally attended by Chairperson Ronald A. Guns. At these meetings, certain representatives of the medical radiation technologists attempted to present a thoroughly distorted picture of why the required courses had not been instituted. It was charged that the reason for this delay was Med Chi inaction. Through the presentation of documentary evidence put together by Ms. Matricciani, and through the testimony of Mr. Troisi before this work group, the chairperson realized that the delay in implementing this program was through no fault of Med Chi, and that HB 1522 was not an appropriate response to the problem. As a consequence, one more piece of legislation targeted against the practice of physicians was defeated.

Dr. Paul A. Stagg addresses annual meeting participants.

Library and History Committee

Mr. President and Members of the House of Delegates:

The Library and History Committee met six times during the 1992-1993 association year. The committee continued its focus on the bicentennial history of medicine in Maryland and collections care and management, and took steps to increase the library's visibility and services to physicians.

Med Chi signed a contract with Jane Eliot Sewell, Ph.D., to research and write a history of medicine in Maryland for the Med Chi bicentennial in 1999. Dr. Sewell, a graduate of the Institute for the History of Medicine at the Johns Hopkins University, has submitted an outline of the proposed volume. It was reviewed favorably by the editorial subcommittee of the Library and History Committee.

Because the bicentennial has focused attention on the importance of preserving and interpreting our historical materials, steps have been taken in that direction. The historian/administrator, Margaret Burri, labeled the portraits on display at the Med Chi building. The volunteer physician cataloging project was revived with a focus on accessioning and cataloging the medical instruments collection. Committee members also volunteered to screen potential rare book donations and to help in identifying donors of significant collections. Finally, two advisory members were added to the committee. Their expertise in collections management and local history make them valuable additions.

The committee did not neglect the current collections. The historian/administrator submitted a draft collection development policy for the committee's comments. As a result, members will review holdings in their medical specialty area and make recommendations to staff regarding strengthening holdings.

The committee, recognizing the importance of increasing the library's services to physician members, supported the Information Services librarian's (Stephen Jones) Grateful Med training course. This workshop introduced physicians to the world of on-line literature searching.

In an effort to increase the library's visibility, the committee approved the loan of Rembrandt Peale's portrait of Horace Hayden to the National Portrait Gallery for a Peale retrospective. Committee members also agreed to write articles appropriate for the "From the Med Chi Collections" section (formerly the "Library Page") in the *MMJ*.

For the upcoming year, the committee plans to continue monitoring the progress of the bicentennial volume, sponsor a session at the semiannual and annual meetings, and begin to plan a dedicated issue of *MMJ* focusing on the history of medicine in Maryland.

❑ ❑ ❑

Committee on Long-Term Care and Geriatrics

Mr. President and Members of the House of Delegates:

The Committee on Long-Term Care and Geriatrics met four times during the 1992-1993 year and was involved in a number of projects. The committee continued its effort to survey nursing home medical directors regarding medical quality assurance guidelines in long-term care institutions in Maryland. Data analysis of the survey should begin this summer. The results of the survey will be submitted to the *Maryland Medical Journal.*

The committee also continued to collect and edit articles for a dedicated issue of the *Maryland Medical Journal* on geriatric medicine. The articles should be submitted to the *MMJ* Editorial Board by the fall.

At the request of George Taler, M.D., chairperson, the committee reviewed a draft legislative bill addressing advance directives. Though the bill was generally well received by the legislature, it will undergo further review and drafting and be resubmitted to the legislature in 1994. The committee will follow the progress of the bill through the legislative process.

In cooperation with the American Medical Association, the committee sponsored the program, "Medical Management in Home Care," during the semiannual meeting in Ocean City and the annual meeting in College Park. The committee, in conjunction with the Prince George's County Medical Society, also sponsored "Preventive Health Care for the Elderly Patient" at the 1993 annual meeting. Both programs were deemed successful.

❑ ❑ ❑

Committee on Managed Care and Third-Party Liaison

Mr. President and Members of the House of Delegates:

The Committee on Managed Care and Third-Party Liaison began its year by reviewing and discussing an array of managed care problems and initiatives. One of the first initiatives undertaken by the former chairperson, Donald H. Dembo, M.D., concerned launching an effort to discuss and resolve health maintenance organization (HMO) issues at the committee level by working through the HMO association. An HMO subcommittee was formed to meet with representatives of the HMO association. At that meeting, HMO payment to nonparticipating physicians and payment for emergency services were considered. It was thought that more meetings would be beneficial and might prevent confrontation in Annapolis.

The former chairperson also addressed numerous inquiries from physicians concerning InforMed. After extensive discussion, the committee approved for publication an informational letter to be written by the president. This letter appeared in the *Maryland Medical Journal (MMJ).*

The committee was asked to assist in addressing pediatric orthopaedic surgeons' concerns regarding reimbursement for specialized procedures. The committee addressed this issue directly with the medical director of Blue Cross and Blue Shield of Maryland (BCBSM), and the surgeons were able to pursue the issue with BCBSM.

It was brought to the committee's attention that there was a reimbursement problem associated with BCBSM's policy on office visits and joint injections. Notifying BCBSM of this problem resulted in a policy change that became effective August 1, 1992. It resulted in BCBSM paying for office visits and joint injections on the same day. Notification of this change appeared in the July 1992 issue of BCBSM's *Provider Journal.*

A coverage change for Swan-Ganz catheter insertion under the General Motors Plan with BCBSM was referred to the committee. Investigation revealed that BCBSM had entered into a different arrangement with General Motors; BCBSM no longer reimbursed separately for the insertion but included it in the anesthesia time. Participating providers were not allowed to bill patients separately for the insertion. Information clarifying this issue was sent to providers who inquired about the change along with an explanation by the carrier that contractual changes affecting patient care coverage appear in the *Provider Journal.*

Uniformity of electronic claims systems was discussed. Information concerning the federal initiative with the private health insurance industry to reach an agreement on computer standards that would allow insurers to use a single claim format, reduce administrative burdens, and produce a substantial savings was published in the *MMJ.*

Unpaid claims by Medicare for transcarinal needle aspirates performed concurrently with bronchoscopic examinations were discussed with the BCBSM Medicare medical director. The medical director resolved the problem and got the claims paid.

The committee reviewed the evaluation and management data analysis provided by BCBSM's Medicare Division. Maryland codes exceeding national and crosswalk data were discussed. It was noted that subsequent hospital visits have been targeted for educational intervention.

The honoring of direct payment authorizations appeared to be a problem for some insurers. A response from the Insurance Division, Department of Licensing and Regulation, revealed that an insurer having knowledge of such an assignment cannot discharge its obligation to the assignee by payment to any other party. Therefore, this matter was clarified for providers raising the issue.

BCBSM's Medicare Division divided cardiac catheterization and coronary angiography into two components—procedural and x-ray interpretation. Maryland was instructed to pay a global fee, and the payment has been low. The problem is being addressed by the Health Care Financing Administration (HCFA). Maryland does not have any freestanding cardiac catheterization laboratories.

At one committee meeting, Stephan L. Werner, M.D., presented information about a new association of health care providers formed to address managed care issues. Dr. Werner informed committee members that the association's focus was extremely narrow and that the association will address only one or two issues at a time.

Because of numerous inquiries concerning the Workers' Compensation Commission (WCC), Neil Robinson, M.D., WCC medical examiner, was invited to a meeting to provide an overview of WCC. Dr. Robinson was informative and helpful. He offered to write an article for the *MMJ.* This article appeared in the May *MMJ* along with a questionaire concerning WCC problems. This coming year, the committee will be compiling the survey information to assess problems and will funnel this information back to WCC. The committee also sent representatives to the Medical Fee Advisory Committee meeting to provide input for the WCC fee schedule.

Crossover claims from Medicare to Medicaid caused a continuous problem for Med Chi members. Investigation revealed that a tape had not been transferred from Medicare to Medicaid. Locating and transfering the tape resolved the problem with a large number of claims, and Med Chi members received payment. Additional problems resulted in further investigation and referral of the issue to the Liaison Committee with the Medical Assistance Program, which was able to provide the membership with a temporary resolution to the problem.

Concerns were raised about Med Chi's representation on the Maryland Alliance for Health Care. The committee expressed these concerns to leadership, and adjustments were made in representation. The committee supported Med Chi's continued involvement in the alliance.

A change in payment for lithotripsy services by M.D.IPA was reviewed, and accessibility of services on an emergent basis versus a nonemergent basis was clarified. Information on this issue was forwarded to providers who raised the concern.

Another issue concerning M.D.IPA was the disallowing of claims retroactively. The committee asked the M.D.IPA, medical director to look into the matter. The medical director was able to correct the problem experienced by Med Chi members.

The committee was active during the past year addressing concerns and issues raised by the membership. The committee thanks all members who made the committee aware of managed care problems and concerns, and thanks the committee's medical director members who provided information and assistance on many issues.

❑ ❑ ❑

The *Maryland Medical Journal* Editorial Board

Mr. President and Members of the House of Delegates:

This report covers calendar year 1992 (Volume 41). Throughout this period, the Editorial Board of the *Maryland Medical Journal* encouraged the submission of original research, case studies, review articles, medical history, and diagnostic and therapeutic updates, as well as commentaries and letters to the editor on all subjects of interest to Maryland physicians.

Following tradition, the January issue included the 1992 legislative directory; the May issue featured the 1992-1993 Med Chi president, Jose Yosuico, M.D.; and the September issue contained the annual committee reports. Due to publishing delays, the December issue incorporated the 1993 legislative directory.

John M. Dennis, M.D., dean of the University of Maryland School of Medicine from 1973 to 1990, and Richard S. Ross, M.D., dean of the Johns Hopkins University School of Medicine from 1975 to 1990, were profiled in the June and October issues, respectively. The July issue also honored Dr. Dennis' illustrious career by focusing on research being conducted at the University of Maryland School of Medicine.

George S. Malouf, Sr., M.D., the 1991 recipient of the American Medical Association's (AMA's) Dr. Benjamin Rush Award, was highlighted in the February issue. The April issue, which was coordinated by the Physician Rehabilitation Committee, addressed the success of long-term physician recovery, as well as intervention and rehabilitation. The August issue was a special edition detailing the history of the origin of the American Academy of Psychoanalysis.

Six new departments were established in 1992. Coordinated by the Maryland Radiological Society, "Imaging Case of the Month" was first featured in March, with Edgar C. Fearnow, M.D., as editor of the department. In May, the *MMJ* introduced "Clinicopathologic Conferences at Johns Hopkins," with Belur S. Bhagavan, M.D., serving as editor. "A Look Back," which consists of reprints of *MMJ* articles from 25 and 40 years ago, was initiated in October. "When the Doctor is Out," a column focusing on Med Chi physicians with unusual hobbies or additional occupations, first appeared in November. Also in November, the journal instituted "In Memoriam" to honor Med Chi members who have passed away, and "Welcome" to identify new Med Chi members. In addition, James Mersey, M.D., took over the responsibility for "A Clinical Moment with Diabetes" from DeWitt E. DeLawter, M.D., who had edited the department for many years.

There were 10 board meetings and one subcommittee meeting during the period. A total of 149 manuscripts were reviewed. Of these, 103 were initially accepted for publication, 14 were not approved, 25 were returned to authors with recommendations for revisions, and 7 were sent to guest reviewers for evaluation.

An *MMJ* subcommittee was formed to make recommendations to the full editorial board about the future direction of the journal. The subcommittee continues to meet as needed. Design changes to enhance readability were adopted, including the use of logos and new formatting for various departments.

Mary Betty Stevens, M.D., was selected as the winner of the sixth annual Best *MMJ* Article Award in the practitioner category for her comprehensive treatise, "The clinical spectrum of SLE," which appeared in the October 1991 issue. Santa J. Johnston, M.D., et al won the award in the best-article-by-a-resident category for the paper, "Inflammatory pseudotumor of the retroperitoneum," published in September 1991.

The editorial board is most grateful to those specialists who graciously contributed their time and expertise in reviewing manuscripts. The following physicians assisted in the *MMJ* review process during 1992: Lindsay S. Alger, M.D., J. Leonard Lichtenfeld, M.D., Margaret Rennels, M.D., and Andrew Ziskind, M.D. (A list of potential guest reviewers was established during the year by contacting department heads at the schools of medicine at Johns Hopkins and the University of Maryland.)

Total page count for Volume 41 was 1,172 (up 22 pages from the previous year). Distribution averaged 7,844 per month, up from 7,769 in 1991. Advertising space averaged 28 percent, down slightly from the previous year due partially to the increasing number of pages in the journal. Postage, paper, and production costs continued to rise, but income kept pace.

The Editorial Board of the *Maryland Medical Journal* encourages Med Chi members to communicate regularly and often about any and all facets of the publication. Constructive criticism, suggestions, and compliments are always welcomed.

Committee members

Editor Victor R. Hrehorovich, M.D.
Associate Editor Henry P. Laughlin, M.D., Sc.D., Sc.S.D.

Eric S. Wargotz, M.D.

Advisory member

Carmine M. Valente, Ph.D.

❑ ❑ ❑

Maternal Welfare Subcommittee

Mr. President and Members of the House of Delegates:

The 1992-1993 year was very busy for the Maternal Welfare Subcommittee. At the beginning of the year, the subcommittee, with Med Chi's approval, entered into an agreement with the Department of Health and Mental Hygiene (DHMH). The agreement provided that DHMH would supply the subcommittee with a copy of the death certificate of each woman who was a maternal mortality in Maryland. The purpose was to analyze maternal mortality problems in order to write educational directives to be printed in the *Maryland Medical Journal*. No individual or institution involved would be named, as the reviews' total focus would be to address global problems in an educational format.

In conjunction with this effort, the subcommittee sent a letter to Maryland hospitals and the Maryland Hospital Association requesting cooperation. All Maryland hospitals with an obstetrics/gynecology department responded favorably to the request. The subcommittee assigned various members responsibility for the maternal mortality reviews. Russell W. Moy, M.D., spearheaded this effort and chaired the group. The initiative resulted in one maternal mortality review during the past year. Identification of maternal mortalities via death certificates was less fruitful than anticipated. Other avenues for identifying maternal mortalities are under consideration.

The subcommittee met with members of Med Chi's Substance Abuse Project (a grant administered under the guidance of Carmine M. Valente, Ph.D.) and answered questions about substance abuse recognition, counseling, and referral. The physicians' answers were incorporated into a survey being conducted by the project, and the committee was provided with initial survey results by the coordinator for the project, Karen Duszynski. The survey's initial results identified educational endeavors that should be pursued with regard to substance abuse recognition and treatment The subcommittee applauded Med Chi's efforts in this area.

A professional liability survey conducted by the American College of Obstetricians and Gynecologists (ACOG) was reviewed by the subcommittee. Evaluation indicated that there are several options for Maryland physicians. Med Chi provides a support group conducted by physician peers and other resources depending on the liability issue. The Medical Mutual Liability Insurance Society offers a professionally conducted support group, a professional one-on-one counseling program, and support services for spouses. Princeton Insurance Company provides a professionally conducted support group and one-on-one peer counseling.

The subcommittee also reviewed the American Medical Association's report from the Council on Scientific Affairs, *Induced Termination of Pregnancy Before and After Roe v Wade: Trends in the Mortality and Morbidity of Women.* This report revealed that abortion became much safer after 1973. Contraceptive use, antibiotics to manage sepsis, and an increase in physicians who provide safe abortions, all contributed to a decline in deaths from abortions. The risk of dying from pregnancy and childbirth was nearly 12 times the risk of dying from an induced abortion. The risk of serious complications from a legal abortion was low. Abortion was safest when

performed early in pregnancy by a well-trained, experienced physician working in a setting equipped to handle complications. Increasingly restrictive abortion laws in the United States would probably not result in mortality rates as high as those of 1940 through 1960. The subcommittee reviewed this information from an educational perspective only as the issue of support of, or opposition to, abortion is a matter for members to decide individually based on personal values and beliefs.

To assist the Montgomery County Health Department with a proposal asking for the provision of volunteer services for pregnant women in need of family planning services, the chairperson approached the membership of the Maryland Obstetrical and Gynecological Society about volunteering for services. The subcommittee also provided the name of a contact person with the Abell Foundation as a possible funding source for this endeavor.

A review of DHMH's funding cutbacks for local health departments resulted in the subcommittee's support for the Committee on Public Health's resolutions. The resolutions proposed restoring funds to local health departments and initiating a volunteer program to make physician services available where there was a need due to DHMH funding reductions.

At the request of President Jose M. Yosuico, M.D., the subcommittee reviewed the length-of-stay guidelines for mothers as dictated by insurance companies and Medical Assistance. Discussion centered around issues such as educational concerns, social concerns, and needed rest; however, subcommittee members noted that the guidelines had not produced a large number of re-admissions because of the change in length-of-stay for mothers. Therefore, the subcommittee did not view this matter as a medical concern. The president relayed this information to Virginia M. Thomas, vice-chairperson, Maryland House of Delegates.

An executive order removed the gag rule concerning abortion discussion by health care professionals in federally funded clinics. The subcommittee reviewed this order and suggested informing members of the change; it was subsequently reported in the *MMJ*.

A subcommittee member reported on the Food and Drug Administration's (FDA) hearings concerning proposed over-the-counter (OTC) contraceptives. He noted that the Centers for Disease Control and Prevention (CDC) supported OTC contraceptives. Concerns were expressed by subcommittee members about educational concerns, liability issues, and price considerations. The subcommittee will monitor this issue.

At one meeting, the issue of abortion reporting was raised. At the current time, abortion reporting is voluntary; it was noted, however, that there was a need for mandatory reporting because the data were important for family planning, primary care services, and reporting statistics to the CDC. Therefore, the subcommittee recommended that Med Chi support mandatory reporting of abortions because of the need to plan for prevention, family services, and primary care services. This recommendation was not supported by Med Chi.

A call for speakers for Med Chi's annual meeting prompted the subcommittee to sponsor a session on breast cancer prevention. In conjunction with the Committee on Public Health and

President Jose Yosuico, M.D., talks with Raymond Scalettar, M.D., during the Presidential Banquet.

the Maryland Medical Breast Society, the subcommittee sponsored "Mammography Potpourri: Screening, Problem Solving, and Clarification of Controversial Topics Surrounding Silicone Implants, Including Rheumatological Aspects."

Coordination with the Baltimore City Health Department's Healthy Start Program continued during this year. Subcommittee members, along with Roseanne M. Matricciani, R.N., J.D., chief operating officer, joined various Healthy Start program subcommittees to work on a medical record abstract tool, an interview tool, goals and objectives, committee formation, hiring of personnel for the Healthy Start Project, a committee review tool, confidentiality and immunity issues, and strategies for conducting Healthy Start reviews. The Maternal Welfare and the Infant, Child, and Adolescent subcommittees will participate in the Healthy Start Project, and Med Chi will oversee the effort. The subcommittee would like to thank Barbara Squires, director of the Healthy Start Program, Baltimore City Health Department, and Ginny Seyler, assistant director of the Health Program Alliance, for their assistance and guidance with regard to the Healthy Start Project.

Russell W. Moy, M.D.
J. Courtland Robinson, M.D.

❑ ❑ ❑

Liaison Committee with the Medical Assistance Program

Mr. President and Members of the House of Delegates:

During the 1992-1993 year, the Liaison Committee with the Medical Assistance Program began its year by assessing the progress of the Maryland Access to Care (MAC) program. One of the committee's first recommendations was to provide the membership with information about the new Eligibility Verification System (EVS), which is used in conjunction with the MAC program, is voice activated, enables physicians to receive important medical care information including prior medical problems, and is able, for the first time, to give physicians retroactive service information.

While many areas of the MAC program were moving forward and working well, numerous calls from emergency rooms for authorization for treatment and prior approval caused many physicians to request that the committee raise this issue with the Department of Health and Mental Hygiene (DHMH). After open discussion of the issue, The Honorable Nelson J. Sabatini, secretary, DHMH, wrote to hospital administrators and addressed the concerns raised by the committee on behalf of Med Chi physicians.

Another concern expressed by physician members to the committee related to the issue of malpractice exposure for MAC program physicians who must authorize or not authorize treatment based on information provided by hospital personnel over the telephone when the physicians have been assigned as MAC providers but have never seen the recipients. Investigation of this issue revealed that a physician's documentation about the telephone conversation along with the action recommended based on the information provided and filing of this information in the patient's record was sufficient documentation from a malpractice perspective. Notifying the caller that the physician must use his or her medical judgment as to the emergency nature of the situation and that the physician had never seen the patient were pertinent points to be verbalized and noted in the documentation.

The debate over the Provider Fee Project ceased when DHMH announced that the project ended on June 30, 1992. The committee had been closely following this issue since the project was introduced during the previous year, and the committee was active in keeping the membership informed about the project.

The Diabetes Care Program, which included an educational component, was discussed, and the committee provided the Medical Assistance program with input concerning course content and length of the course. As a result of this effort, the continuing medical education (CME) requirement was restructured.

DHMH initiated a Drug Use Review (DUR) Board during this last year. The purpose of the DUR Board was to make recommendations concerning standards and criteria for the Medical Assistance program with regard to drug utilization. The DUR would also be able to demand reports on drug utilization and direct that studies be undertaken. The commit-

tee recommended that Med Chi forward the name of Reed A. Winston, M.D., a member of the committee with an extensive background in pharmacology, as a DUR Board candidate. Dr. Winston was chosen to be a member of the DUR Board and is the committee's and Med Chi's liaison with the board.

Another issue affecting physician practice concerned the Medical Assistance program's requirement that the rendering physician be identified on the claim form when there is a coverage agreement and the billing physician's name is provided. This requirement was contrary to current practice for cross coverage situations and, in Med Chi's opinion, was not required by federal Medicaid/Medicare statute or regulation. The committee recommended that this issue be investigated, and DHMH is having its attorneys review the matter.

Inquiry concerning tubal ligations performed in an ambulatory setting led the committee to raise the issue with the Medical Assistance program since a procedure code had not been assigned for this procedure. Issues surrounding procedure coding for the facility and payment for the facility and the physician providing the service were raised and are being addressed by the Medical Assistance program.

A major issue affecting many members concerned the nonpayment of timely submitted claims by Medicaid. An investigation revealed that a number of claims had not crossed over from Medicare to Medicaid. In one instance, the claims (tape) had never been delivered to Medicaid. In other instances, the problem could not be readily identified. Rejection of claims in some cases was attributed to information being placed in the wrong location on the Health Care Financing Administration (HCFA) 1500 form. Numerous inquiries concerning this matter, however, led the committee to request that the Medical Assistance program provide a solution to the problem, especially since timely resubmission of claims was a problem, and payment was not forthcoming.

The Medical Assistance program reported to the committee that the problem appeared to be with the submission of paper claims and entry of the information by keypunch operators who do not read the information but simply enter it. If the claim was filled out incorrectly, the incorrect information would go into the computer, and the claim would not be paid. In response to the committee's request for a solution, the Medical Assistance program proposed the use of a form for all physicians submitting paper claims in order to alleviate the situation and get physicians paid. While the committee did not want to increase physicians' paperwork, the committee thought this solution was a reasonable temporary measure to assure that payment for services is rendered. Furthermore, the committee recommended, and Med Chi approved, that Med Chi support the proposed lengthening of the billing period for Medical Assistance from six months to nine months.

Other issues addressed by the committee included

- Dissemination of information about a DHMH cancer grant;
- Exploration with DHMH of the feasibility of having a centralized drug dispensing system for Medicaid patients;
- Review of state budget cuts and their effect on Medicaid patients, with dissemination of information about budget cuts;
- Review of the restriction on the use of H2 blockers and other medications; and
- Review of several cases concerning denial of payment for acute care.

The committee continues to be a liaison with the Medical Assistance program. Members would like to thank all physicians who brought issues and concerns to the committee's attention during this last year.

Dr. Allan Jensen serves as moderator for the Blue Cross/Blue Shield update session.

Committee members

Chairperson Joseph W. Zebley III, M.D.
Aristides C. Alevizatos, M.D.
Paul Burgan, M.D.
Irvin B. Kaplan, M.D.
Selvin Passen, M.D.
Margaret T. Snow, M.D.
Reed A. Winston, M.D.

Joseph W. Millstone
Mary Mussman, M.D., M.P.H.
Lawrence R. Payne
The Honorable Nelson J. Sabatini

❑ ❑ ❑

Committee on Medicine and the Performing Arts

Mr. President and Members of the House of Delegates:

During the 1992-1993 year, the Committee on Medicine and the Performing Arts sponsored three successful meetings. These were designed to educate various segments of the local health and arts communities and emphasized clinical demonstrations. The committee met six times.

The first event of the year was an afternoon seminar on Saturday, January 23, entitled "Overuse, Focal Dystonia, and Technique Impairment." The featured speakers were surgeon Hunter J. H. Fry, M.S., of Australia; Mark Hallett, M.D., clinical director of the National Institute of Neurological Disorders and Stroke in Bethesda; and Dr. Thomas Mastroianni, chairperson of piano at Catholic University in Washington, DC.

DR. DONALD DEMBO ASKS A QUESTION AT THE HOUSE OF DELEGATES MEETING.

Dr. Mastroianni gave an overview of the career and educational aspects of technique loss for musicians, especially pianists. Dr. Hallett discussed the roles of the central and peripheral nervous systems in overuse, focal dystonia, other musculoligamentous disorders, and nerve entrapment syndromes. Dr. Fry lectured on the symptoms and treatment of painful overuse and related loss of coordination. A panel discussion with these three speakers and Nguyet Dang, a biomedical engineer at the National Institutes of Health (NIH), focused on research conducted as part of a special interdisciplinary doctoral program created for Dr. Fry by NIH and Catholic University. Results are still preliminary, but may show a closer relationship between overuse and focal dystonia than previously recognized.

On March 20-21, the committee presented a second regional conference titled "Performing Arts Medicine II: Focus on Young Performers," as a follow-up to last year's initial meeting. This year's conference focused mainly on local speakers, including physicians, psychologists, occupational therapists, and Alexander and Feldenkrais techniques teachers. The emphasis was on subjects not covered previously, especially those which could be enhanced by actual demonstrations. Registrants participated in a short Feldenkrais technique lesson and had the opportunity to handle large percussion and brass instruments of marching bands.

The committee also sponsored a session at the Med Chi annual meeting on April 29 entitled "Cues and Clues in Performing Arts Medicine: Don't Miss a Diagnosis." Committee members Bernard E. Filner, M.D, Lawrence Funt, D.D.S., and Leo Rozmaryn, M.D., discussed sample cases that illustrated the complexity of treating performing artists. Three

performers demonstrated their problems and what solutions the health care team had found.

The committee oversaw a dedicated issue of the *Maryland Medical Journal* based on papers from the 1992 conference. The resulting journal was excellent, and many positive comments have been received. The committee also continues to receive requests for Music Medicine Clearinghouse bibliographies, photocopies, and research assistance from all over the country.

During the next year, the committee will expand its membership, revise service fees, and continue to publicize its activities. The committee has been invited to present a session at the semiannual meeting in September and plans to have a third regional conference in 1994.

Committee members

Chairperson John B. DeHoff, M.D.
Emidio A. Bianco, M.D.
Bernard E. Filner, M.D.
Leo M. Rozmaryn, M.D.
Lew C. Schon, M.D.

Advisory members

Sandra Bishop, M.S.
Ruth Drucker
David Fetter
Lawrence A. Funt, D.D.S.

❑ ❑ ❑

Committee on Medicine and Religion

Mr. President and Members of the House of Delegates:

The Committee on Medicine and Religion held two meetings during the 1992-1993 committee year. The committee is interested in expanding its membership by including members of as many faiths as possible. In this way, the group would have a broader view of the moral and ethical approaches of religion in relation to medical care.

The committee was pleased to present the prayer luncheon at the 195th annual meeting held at the University of Maryland at College Park. Jack Zimmerman, M.D., chief of surgery at Church Hospital, made a thought-provoking presentation, "Unnecessary Treatment in Hopeless Illness: Overutilization?," to the numerous physicians in attendance.

Committee members

Chairperson Leslie R. Miles, Jr., M.D.
Ralph E. Libby, M.D.
Robert E. May, M.D.
Rhodora C. Tumanon, M.D.
Gibson J. Wells, M.D.

❑ ❑ ❑

Jose Yosuico, M.D.; Joseph Snyder, M.D.; Raymond Scalettar, M.D.; and George Malouf, Sr., M.D., enjoy the Presidential Banquet

Committee on Mental Health

Mr. President and Members of the House of Delegates:

The Committee on Mental Health met eight times during the past year. The committee was pleased to sponsor the presentation, "Treatment of Depression as Secondary Prevention," at the 195th Med Chi annual meeting. The well-received presentation, which was funded by an educational grant from SmithKline Beecham Laboratories, was delivered by Jerrold F. Rosenbaum, M.D., associate professor of psychiatry at Massachusetts General Hospital and Harvard Medical School; Arthur Hildreth, M.D., chief of psychiatry at Union Memorial Hospital and president of the Maryland Psychiatric Society; and Paul McClelland, M.D., chairperson of the Department of Psychiatry at Greater Baltimore Medical Center.

After much review and consideration, the committee endorsed the distribution of the brochure from the Committee on Physician Rehabilitation, *Medical Treatment Never Includes Sexual Contact,* to all Maryland physicians.

To advocate on behalf of the mental health needs of Maryland citizens, two committee members were appointed to the Med Chi Ad Hoc Committee on Health Care Reform and to the Med Chi Committee on Managed Care and Third-Party Liaison.

The committee has been working eagerly to resurrect the monthly column, "Today's Psychiatry," in the *Maryland Medical Journal.* Manuscripts have been submitted to the editorial board for publication consideration. The committee looks forward to a productive 1993-1994 year.

Committee members

Chairperson Lino Covi, M.D.
Arnold Brenner, M.D.
Daniel F. Krank, M.D.
Mohamad A. Lofti, M.D.
Edward L. Suarez-Murias, M.D.
Ronald J. Taylor, M.D.
Mehdi L. Yeganeh, M.D.
Leonard M. Zullo, M.D.

❑ ❑ ❑

Peer Review Committee

Mr. President and Members of the House of Delegates:

The Peer Review Committee is charged with "reviewing the practices of Maryland physicians as referred by the Peer Review Management Committee upon the request of the State of Maryland Board of Physician Quality Assurance ... for the purpose of evaluating the professional, physical, and mental competency of physicians. This review shall include, but not be limited to, the quality of care rendered and shall be conducted within the guidelines set forth in the *Peer Review Handbook.*"

In furtherance of this charge, the Peer Review Committee prepared numerous peer review reports during its 1992-1993 term pursuant to referrals from the Board of Physician Quality Assurance (BPQA) through the Med Chi Peer Review Management Committee. Numerous meetings were held, including both full committee and subcommittee meetings. Committee members and other physicians also contributed to the work of the committee by reviewing and reporting on charts and by conducting office evaluations. The work of the members does not end with the conclusion of the committee's investigation, since additional record reviews and meetings with members of the staff of the attorney general to prepare cases for legal action also may be required. The seriousness of the cases referred to the committee is evidenced by the fact that over one-third of the physicians on whom reports were prepared in calendar year 1992 were referred by the BPQA to the Office of the Attorney General to be charged with violation of the Medical Practice Act based on the peer review report. A major concern of the committee continues to be improving the speed with which peer reviews are conducted and reported back to the BPQA, while preserving both fairness and quality in the review process.

The committee regularly uses physicians who are not committee members as specialty consultants in each review. Therefore, the committee needs additional reviewers and welcomes any volunteers who wish to assist in this important work.

My sincere thanks to the dedicated members of this commit-

tee, to our many specialty consultants, and to the Med Chi staff for their support and assistance during this past, very busy year.

Committee members

Chairperson Paul Burgan, M.D.
Co-Chairperson Henry J. Farkas, M.D.
Co-Chairperson James W. Karesh, M.D.
Fritz Apollon, M.D.
Amir S. Banisar, M.D.

Larry G. Tilley, M.D.
Richard L. Wolfe, M.D.

❑ ❑ ❑

Peer Review Management Committee

Mr. President and Members of the House of Delegates:

The Peer Review Management Committee (PRMC) has continued its function of overseeing the peer review process as specified in the *Peer Review Handbook for Maryland.* The committee meets monthly and is responsible for the following duties:

- Receiving and recording cases referred to Med Chi by the Board of Physician Quality Assurance (BPQA);
- Identifying the guidelines used in conducting the review;
- Referring cases to the appropriate medical review committee;
- Developing and maintaining a monitoring procedure allowing for an immediate status determination of a peer review complaint and ensuring that the review is completed in a timely manner;
- Reviewing reports received from investigating committees to determine their adequacy;
- Identifying inadequacies in writing and returning a report to the review committee if the committee finds a report inadequate;
- Transmitting adequate reports to the BPQA;
- Forwarding a copy of final disposition reports received from the BPQA to the appropriate medical review committee;
- Identifying areas in which medical review committees need education, and arranging to have the necessary education provided;
- Providing organizational assistance to any medical review committee in Maryland; and
- Periodically meeting with the BPQA to decide what kinds of statistical information are needed by the BPQA, Med Chi, and component societies to aid in evaluating and upgrading the review process.

In addition to providing direction to the peer review committees of Med Chi and component societies regarding the review of cases referred to Med Chi, the PRMC lent support, during the past year, to the effort to preserve the $50 license fee as a dedicated source of funds for Med Chi's physician rehabilitation and peer review activities.

The PRMC sought to improve the peer review process by educating peer review groups regarding the guidelines established in the *Peer Review Handbook for Maryland* (*Handbook*) for the conduct of review activities. Education occurred at local and specialty society peer review committee meetings and by the PRMC's insistence that all reports be in compliance with the *Handbook's* guidelines before being transmitted to the BPQA. PRMC representatives also regularly attended the meetings of the BPQA.

The chairperson thanks all committee members, Med Chi staff, and the members and staff of all Med Chi and component peer review committees for their efforts and support which enabled the PRMC to make a significant contribution to the efficacy and fairness of the review process.

Donald S. Stepita, M.D.
Karl H. Weaver, M.D.
Herbert L. Yousem, M.D.

❑ ❑ ❑

Physician/Patient Relations Committee

Mr. President and Members of the House of Delegates:

The Physician/Patient Relations Committee (PPRC) continues to investigate complaints against physicians. These complaints are investigated at the request of the Board of Physician Quality Assurance (BPQA). The PPRC's findings and recommendations are submitted to the BPQA for consideration and disposition.

In this past year, the PPRC assumed responsibility for screening Health Claim Arbitration Office (HCAO) cases received from the BPQA. After consideration of the PPRC's extensive experience in review of single incidents, the PPRC was asked to accept responsibility for screening these cases. Since this assignment was made, the PPRC has been meeting to screen HCAO cases on a monthly basis. Once reviewed, the PPRC's findings are forwarded to the BPQA, which determines, after considering the PPRC's findings, whether the cases require a more extensive peer review.

The dedication and commitment of PPRC members and staff to the continuation and improvement of the peer review process is deeply appreciated.

Committee members

❑ ❑ ❑

Committee on Physician Rehabilitation

Mr. President and Members of the House of Delegates:

The Committee on Physician Rehabilitation has continued to maintain its umbrella of advocacy for Maryland physicians. In collaboration with the Committee on Alcoholism and Chemical Dependency, the committee sponsored a highly successful conference, "The Third Annual Conference on Addiction: Physician Health and Education," on November 21, 1992. The committee looks forward to cosponsoring another addiction conference in the fall of 1993.

Also with the Committee on Alcoholism and Chemical Dependency, the committee sponsored tobacco advertisement warning labels for waiting room magazines containing tobacco advertisements. The labels were forwarded to Maryland physicians via direct mail, the *Maryland Medical Journal,* and *Straight Forward.* The labels received wide coverage, including a press conference to introduce them. They have been well received by the medical community.

The committee strives to continue to assist Maryland physicians. The committee's newsletter, *Straight Forward,* continues to inform and educate physicians and other allied health professionals on substance abuse issues.

Due to the dedication and collaboration of committee members and the Maryland Psychiatric Society's Peer Review Committee, the brochure, *Medical Treatment Never Includes Sexual Contact*, was published in the spring 1993 issue of *Straight Forward*. The committee has received several requests from other states for copies of the brochure.

The committee was pleased to sponsor the presentation, "Recent Breakthroughs in Understanding and Reducing Physician Stress," by Mort Orman, M.D., at Med Chi's 195th annual meeting. The presentation was well received.

Outreach presentations continue to be made to hospital medical staffs throughout the state and to component and medical specialty societies as well. Overall, the presentations have been well received. Outreach efforts took committee members and staff to 53 different venues at which program information was presented to close to 4,000 people, nearly 2,500 of whom were physicians. Included in outreach was distribution of information on the Physician Rehabilitation Program to 115 Maryland district court judges.

Suggestive of the effectiveness of outreach efforts, "concern calls" have remained at a high level. A concern call, or referral, instigates the assessment process. In calendar year 1992, 112 new concern calls were recieved. Board of Physician Quality Assurance (BPQA) referrals comprised about 17% of 1992 referrals, representing a 58% increase in BPQA referrals. Also conducted were nearly 2,000 phone contacts with program participants and over 1,100 phone contacts with treatment professionals. In calendar year 1992, the program conducted nearly 600 individual sessions and over 1,200 urine screen contacts with program participants. There has been some increase in referrals for mental health and emotional problems, including sexual-related issues and stress from malpractice litigation. In response to the stress reaction to malpractice suits, the Committee on Physician Rehabilitation is initiating efforts to provide litigation stress support services to colleagues.

During the past legislative session, committee members testified and campaigned for amendments to SB 371 and HB 232 to maintain the physician licensure fee funding for Med Chi's physician rehabilitation, peer review, and focused professional education programs. Chairpersons from the respective committees sought to educate members of the House and Senate committees involved in hearings on SB 371 and HB 232 as to the value of the programs endangered by the bills. Senators seemed impressed with the valuable work the committee has been doing, and all agreed that dismantling the program would be a mistake. Committee representatives were able to demonstrate that the program is dedicated to helping physicians, and that the program has been, and will continue to be, accountable to the state in regard to the use of physician licensure fee funds. It was also clarified to Senate committee members that Med Chi's Physician Rehabilitation Program is the only statewide organization for assisting impaired physicians.

The Committee on Physician Rehabilitation is pleased with the advances made in the past year and looks forward to continued growth in the next. The chairperson wishes to express his regard and appreciation to the hardworking and dedicated committee members who continue to give unselfishly of their time and energy to the important work of this committee.

❑ ❑ ❑

Ad Hoc Review Committee on Physicians with Bloodborne Pathogens

Mr. President and Members of the House of Delegates:

In August 1992, the president of Med Chi created the Ad Hoc Review Committee on Physicians with Bloodborne Pathogens. The committee's purpose is to plan and implement a process to carry out the *Practice Protocol for Physicians with Human Immunodeficiency Virus (HIV),* which the Med Chi House of Delegates adopted on September 14, 1991.

The goal of the Ad Hoc Review Committee on Physicians with Bloodborne Pathogens is to protect the public by assuring safe medical care. To accomplish this goal, the committee will meet with a physician who has had a confirmed positive test for HIV, hepatitis B virus (HBV), or other bloodborne pathogen to evaluate the potential transmission risk of the physician's infection to patients through exposure-prone invasive procedures. The committee will establish a list of exposure-prone invasive procedures normally performed in the practice of the physician's specialty and identify those procedures that the condition will prevent the physician from performing safely. In addition to referrals from the Board of Physician Quality Assurance (BPQA), the committee will receive self-referrals.

In its first nine months, the committee met several times to complete the instructions and guidelines for one referral from the BPQA and to draft a handbook to define its process and policies. When staff of the American Medical Association (AMA) reviewed parts of this handbook, the AMA considered the handbook the most detailed document on this issue put together by any state medical society in the country. Med Chi Council adopted the handbook on March 18, 1993.

Committee members

Chairperson John G. Bartlett, M.D.
Eric M. Fine, M.D.
Jack M. Zimmerman, M.D.

❑ ❑ ❑

Committee on Professional Ethics

Mr. President and Members of the House of Delegates:

The members of the Committee on Professional Ethics took action on a variety of issues of public and professional concern. Some of the areas in which this committee took an active interest are highlighted below.

The committee closely monitored and contributed to the development of Maryland's Health Care Decision Act—the advance directives legislation. Two versions of this legislation were presented to the Maryland General Assembly. One was drafted by a commission under the leadership of the Honorable John Carroll Byrnes, a circuit judge for Baltimore City. The second, modeled after a similar law passed in Virginia, was put together by a committee headed by law professor Diane Hoffman and the Honorable John F. Fader II, circuit judge for Baltimore County. The final legislation combined the best of both these bills; the Committee on Professional Ethics recommended a series of admendments to these bills, all of which were adopted into the final act.

The committee also recommended the preparation of a "Do Not Resuscitate" bill directed to emergency care. Although this bill (HB 1602) was introduced in the House of Delegates, it received an unfavorable report in the House Environmental Matters Committee and was not enacted.

The committee was also involved in the self-referral debate this year. Working in conjunction with the Med Chi Ad Hoc Committee on Self-Referral, the Committee on Professional Ethics adopted the position that Med Chi should oppose any further legislation restricting referrals, and that Med Chi should create a standing committee to deal with the ethical aspects of self-referral issues as they arise; the standing committee would be guided by the position of the American Medical Association Council on Ethical and Judicial Affairs. To some extent, the committee's position was preempted by action of the Maryland General Assembly, which enacted HB 1280, substantially restricting self-referral and investment activities.

As authorized under the Maryland corporation law, the committee continued to pass on the ethical propriety of specific professional corporate names. Further, the committee considered and adopted an amendment to the Med Chi *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland,* Section 502.03, clarifying the propriety of advance payment for medical services and a physician's ethical requirement to refund such payment in the event of cancellation.

It should be noted that this year marked the last year of distinguished service by Louis C. Breschi, M.D., as chairperson of the Committee on Professional Ethics; after many years in this capacity, Dr. Breschi has turned over the duties of chairperson to Leslie R. Miles, Jr., M.D., who will carry on the mission of this committee to maintain the high standards of ethical propriety that characterize the practice of our profession in this state.

Jack M. Zimmerman, M.D.

❑ ❑ ❑

PRO Monitoring Committee

Mr. President and Members of the House of Delegates:

The PRO Monitoring Committee began its year by reviewing the 1991-1992 PRO Annual Report published by the Delmarva Foundation for Medical Care, Inc. (Delmarva), which is the professional review organization (PRO) for Maryland and which oversees the inpatient care of Maryland Medicare beneficiaries under a contract with the Health Care Financing Administration (HCFA). It was noted in this report that only one Maryland physician had been formally sanctioned during the previous year. Confirmed quality problems were reviewed, and inpatient quality review was discussed.

The committee's main thrust continued to be assisting physicians who have been assigned quality points by Delmarva. The committee served as a source of information and support for these physicians.

A utilization review case was referred to the committee this year, and guidance and information was provided to the practitioner who referred the case. Although this case pertained to Medical Assistance, the committee provided assistance because Delmarva has the utilization contract for the Maryland Medical Assistance Program.

The committee invited Christian E. Jensen, M.D., Delmarva's corporate medical director and president, to make a presentation on the Fourth Scope of Work—the new HCFA initiative. This new scope of work addresses HCFA's approach to the medical review of Medicare beneficiaries and is called the "Health Care Quality Improvement Initiative (HCQII)." It will look at a broad overview of quality. It will begin in July 1993 and will emphasize cooperation and working toward common goals. HCQII is focused on improving the mainstream of care and elevating the general standard of care. Patterns of care and outcome rather than an individual physician's work will be targeted. Under this new scope of work, PRO and Medicare claims data will be used to create treatment outcome profiles for hospitals and physicians. One initiative will be the miniature hospital information project. In this initiative, the PROs will try to duplicate HCFA's mortality data. The second initiative is called the National Cooperative Cardiovascular Project, which will look at myocardial infarction, bypass surgery, and coronary angioplasty. It is going to examine the comparative results of treatments in different institutions. The committee will follow this new initiative and its impact on physicians and patients, as well as provide feedback to Delmarva.

In many cases reviewed by the committee this year, quality points assigned to physicians were erased or decreased. The committee has been vigilant in addressing hassle factor issues and issues surrounding the conduction of chart reviews with Delmarva. It is the committee's sincere hope that the Fourth Scope of Work will allow a more cooperative and educational approach by the PROs.

As always, the committee is available to assist Med Chi's membership with questions or concerns involving PRO activities. The commitee thanks the membership for bringing issues to the committee's attention.

Committee on Public Health

Mr. President and Members of the House of Delegates:

The Committee on Public Health began the 1992-1993 year by discussing major public health concerns surrounding cancer and family violence. The committee reviewed information on the Maryland Cancer Control Plan Media Campaign and the state's effort to aggressively address cancer prevention.

Because of severe budgetary cuts proposed to deal with the state's fiscal crisis, the committee reviewed and discussed Plan 1 and Plan 2 posed by Governor William Donald Schaefer. Review of these plans revealed severe reductions to state and local health departments. Therefore the committee recommended that Med Chi adopt the following resolutions:

- *Resolved*, That the Medical and Chirurgical Faculty of Maryland urges the governor to restore $11.6 million of proposed reductions from the $450 million package to support state and local health departments' relationships to maintain necessary preventive, early detection, and intervention and restorative services to those most in need within the state of Maryland.
- *Resolved*, That the Medical and Chirurgical Faculty of Maryland shall take a leadership position in responding to patient needs by making every effort to ensure that each component medical society works in harmony with their respective county/city health department to provide, voluntarily, those specific medical services that are required in their specific geographical area, which will not be available due to the reduction of funding for these programs.

Both resolutions were approved by Med Chi with Med Chi amending the second resolution to read:

- Therefore, be it *Resolved*, That the Medical and Chirurgical Faculty of Maryland takes a leadership position in responding to patient needs by encouraging each component medical society to work with their respective county/city health department to provide, voluntarily, medical services, which will not be available due to the reduction of funding for local health department programs.

Med Chi encouraged component medical societies to work closely with local health departments on the issue of voluntary physician services. The committee noted that Med Chi's efforts with regard to funds restoration for local health departments may have been the impetus for the restoration of part of those funds in the state's new budget, and that the voluntary effort by physicians to donate preventive health care to the public helped fill gaps created by the state's budgetary cuts. The chairperson participated in Med Chi's news conference, which highlighted the importance of the restoration of funds and the volunteer effort proposed by Med Chi.

Budgetary cuts raised concerns about the cancellation of children's orthopaedic clinics at local health departments, and the matter was referred to the committee. Due to reductions in funding, nine counties (mostly rural) terminated orthopaedic clinics. This issue was referred to Judson F. Force, M.D., M.P.H., director of Children's Medical Services, Department of Health and Mental Hygiene (DHMH), for his assistance in determining the impact of orthopaedic clinic terminations on continuing access and provision of these important specialty services. This issue is still being pursued.

Prisoners' medical needs was an issue submitted to the committee for review. Discussion addressed delivery of care, contagious diseases, the aging prison population, and lack of follow-up care when a prisoner is no longer incarcerated.

The committee discussed a bill introduced in Prince George's County on the banning of pit bulls and Rottweilers. The committee refrained from taking a position in this matter.

Governor William Donald Schaefer's initiative, "Partnership for Healthy Living," was reviewed. His proposal focused on women and children with an emphasis on disease prevention, health education, health promotion, and health policy. The initiative included a health mobile. Committee members discussed their experiences with health mobiles and the problems associated with recordkeeping, continuity of care, and reportability. Other endeavors included tobacco-free posters, physical fitness projects in schools, and injury prevention. Several of these aspects were forwarded to the committee's subcommittees for review and possible implementation.

DHMH embarked on an endeavor that coincided with the governor's cancer initiative. With outside funding, DHMH set up a program to pay for the diagnosis and treatment of breast and cervical cancer. The committee reviewed the endeavor and

noted that DHMH decided to reimburse health care providers at the Medicaid rate rather than the Medicare rate, even though local health departments and Med Chi supported reimbursement at the Medicare rate in order to attract physician participants and assure the program's success. The committee suggested that President Jose M. Yosuico, M.D., forward a letter to DHMH expressing concern over the choice of reimbursement for these services. The president agreed with the committee's suggestion, and an effort was made to change the reimbursement level, but it was not successful.

During the last year, the American Medical Association (AMA) revised its plan to reform America's health care system, "Health Access America." The committee reviewed the plan's changes and recommended Med Chi's continued support. Med Chi has continued to support "Health Access America," and forwarded the information to the Maryland Health Resources Planning Commission when it embarked on a project to compare health system reform plans.

Correspondence from a consumer concerning the need to continue to provide routine physical examinations at the Social Security Administration was referred to J. Michael McGinnis, M.D., deputy assistant secretary for health, Office of Disease Prevention and Health Promotion, DHMH. Dr. McGinnis agreed with the committee that targeted screening based on risk factors needed to be recommended, and he supported the committee's efforts in this area. Dr. McGinnis addressed the matter directly with the Social Security Administration.

Because of increased violence in our society and the concern that family violence was not being properly addressed, the committee reviewed and discussed various initiatives in this area. Some initiatives evaluated were from the AMA, Howard County Violence Prevention Task Force, Wisconsin, the Family Violence Prevention Fund, the Massachusetts Medical Society, and Ohio. Joanne Tulonen, executive director of the Maryland Alliance Against Family Violence, was invited to speak to the committee and provide an overview of the alliance's efforts. Committee deliberations resulted in a commitment to pursue a campaign aimed at educating physicians about family violence. Activities centered on this endeavor will be pursued in the coming year; the timeliness of a seminar about domestic violence, however, was recognized by the committee, and a seminar was cosponsored by the committee, the Public Relations Committee, and the Med Chi Auxiliary entitled, "Preventing and Responding to Domestic Violence: What Every Physician Should Know."

The committee continued to be the oversight committee for the following subcommittees: Immunizations and Infectious Diseases Subcommittee; Infant, Child, and Adolescent Health Subcommittee; Maternal Welfare Subcommittee; and Sports Medicine Subcommittee

JOSEPH SNYDER, M.D., 1993-1994 MED CHI PRESIDENT (R), PRESENTS A WATCH TO THE OUTGOING PRESIDENT, JOSE YOSUICO, M.D.

Committee on Public Relations

Mr. President and Members of the House of Delegates:

The Committee on Public Relations began the 1992-1993 year by reviewing existing public relations programs and opening discussion for new programs. The committee agreed to focus on two new campaigns—breast cancer awareness and family violence—and to continue successful ongoing programs including the Doctor/Lawyer/Teacher Partnership Against Drugs, public service announcements, the radio "Consultation" program, and various awards.

Breast cancer awareness. The Public Relations Committee worked in cooperation with the Med Chi Auxiliary to encourage Med Chi to sponsor two billboards with the message: "Your chance of getting breast cancer is ONE IN NINE. Mammography. Your most powerful weapon." The campaign's purpose was public awareness. The billboards were displayed on Route 50 for viewing by traffic traveling to and from Ocean City, Maryland. They were displayed from the middle of September until the middle of October (breast cancer awareness month) and included a sponsorship line crediting the Maryland State Medical Society.

Family violence. The Public Relations Committee, in alliance with the Committee on Public Health and the Med Chi Auxiliary, concentrated efforts on a campaign against family violence. As an initial effort, the committee recommended a resolution pertaining to family violence, which was adopted by Council. The resolution addressed the need to increase awareness and sensitivity on the part of physicians and the community. In response, a session entitled "Preventing and Responding to Domestic Violence: What Every Physician Should Know" was held during the annual meeting. C. Sue Hecht, president, Maryland Network Against Domestic Violence, and Susan C. Mize, executive director, Maryland Network Against Domestic Violence, presented the program and provided participating physicians with a reference guide entitled *Partners in Prevention.* This valuable resource included a service provider directory with information about each domestic violence program and a list of services arranged by county. Med Chi and the Maryland Network Against Domestic Violence plan to work together to address and prevent domestic violence in Maryland.

Partnership program. The Doctor/Lawyer/Teacher Partnership is a successful community program coordinated by the Public Relations Committee. Through this program, doctors and lawyers visit local schools to talk with students about the medical and legal consequences of drug and alcohol use. This year, partnership programs were conducted in Baltimore City, Baltimore County, Harford County, and Prince George's County. Med Chi conducted a training session for physicians wishing to participate. During the training session, physicians were provided with "Drugs are a Deadly Game" posters to use as visual aids.

Public service announcements. The Public Relations Committee distributed three public service announcements (PSAs) from the American Medical Association to local television stations. The three messages, an anti-cocaine campaign, "Don't Blow It"; an anti-smoking campaign, "Ashes to Ashes"; and an AIDS (acquired immunodeficency syndrome) prevention campaign, "Play It Safe," were broadcast by local networks throughout the 1992-1993 year. These PSAs provide a valuable community service and make people aware of the state medical society's existence.

Radio program. Health-related topics and issues surrounding today's medical community are discussed on the Med Chi–sponsored radio program, "Consultation," a physician interview show broadcast on WBAL-AM radio at 9:30 a.m. on Sunday mornings. Fifty-six physicians participated in the 1992-1993 year.

Awards. The committee continued to sponsor its awards programs, including the Wyeth-Ayerst Laboratories Physician Award for Community Service, which is presented yearly to a physician who has provided outstanding community service outside the field of medicine. John O. Meyerhoff, M.D., received the 1993 award during the annual meeting for his work with Parents Anonymous of Maryland.

The Third Annual Award for Excellence in Organized Medicine, an award created to encourage medical student involvement in organized medicine, was presented to Jeffrey Jonathan Wise, a medical student at the University of Maryland School of Medicine, during the annual meeting.

The Public Relations Committee also sponsored the Thirteenth Annual Photo Contest. Med Chi and auxiliary members entered 14 photographs, which were judged by Evan Cohen, a professional photographer from Baltimore. Jerrold M. Post, M.D., won first place and Mrs. Morrell Williams won second place. All entries in the photo contest were displayed during the annual meeting.

Certificates of recognition were presented, during the House of Delegates session of the annual meeting, to four physicians for their outstanding service and dedication as Med Chi committee chairpersons. President Jose M. Yosuico, M.D., presented certificates to Paul A. Stagg, M.D., chairperson, Ad

Hoc Committee on Self-Referral; Harrold T. Elberfeld, M.D., chairperson, Maternal Welfare Subcommittee; Ronald Fishbein, M.D., chairperson, Ad Hoc Bicentennial Committee; and John G. Bartlett, M.D., chairperson, Ad Hoc Review Committee on Physicians with Bloodborne Pathogens.

With so much of today's attention focused on the health care industry and health care reform, the committee faces a challenge to improve physicians' public image. The committee always welcomes suggestions and comments from Med Chi members on all activities. As chairpersons, we would like to thank committee members and all participating physicians whose time and effort have made this a productive year.

Committee on Scientific Activity

Mr. President and Members of the House of Delegates:

In 1992, the bylaws of the Committee on Scientific Activity were modified. The committee was expanded to nine members, who will serve three-year terms. Three new members will be appointed each year.

The committee met eight times during the past year and developed educational activities approved for 76 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. These included the following:

- the Med Chi semiannual meeting at the Princess Hotel in Ocean City (15 hours)
- the president's regional meetings (3 hours)
- the "Third Annual Conference on Addiction: Physician Health and Addiction" (7.5 hours)
- the second annual program on medical problems of performing artists, "Performing Arts Medicine: Issues in Diagnosis and Management" (9 hours)
- "Substance Abuse Education for Primary Care Physicians: An Overview of Treating Substance-Abusing Patients" (2 hours)
- "Substance Abuse Education for Primary Care Physicians: An Overview of Treating Substance-Abusing Patients"—Home study program (3 hours)
- "Alcohol Use and Pregnancy Outcome" (1 hour)
- the Med Chi annual meeting at the University of Maryland at College Park (35.5 hours)

It is through the efforts of the entire committee that these programs and activities have been so well received and worthwhile. I want to take this opportunity to express my appreciation to all committee members.

Committee members

Chairperson J. Richard Lilly, M.D.
Benjamin V. Del Carmen, M.D.
Gershon Efron, M.D.

Jose Martinez, M.D.
Myron I. Murdock, M.D.
Stanley R. Platman, M.D.
Walker R. Robinson, M.D.

Advisory member

Marianne U. Chiccone, D.M.D.

❑ ❑ ❑

Ad Hoc Committee on Self-Referral

Mr. President and Members of the House of Delegates:

At its meeting of September 19, 1992, Med Chi's House of Delegates referred the subject of self-referral to an Ad Hoc Committee on Self-Referral. The committee's charge was to study self-referral issues from various standpoints including ethical, legal, and legislative. The committee was instructed to analyze and evaluate the continuing debate on self-referral, make pertinent literature available, and report its findings and recommendations to Council and the Executive Committee.

At the committee's first meeting, members reviewed the current Maryland self-referral law and key legislation from New York, Illinois, Florida, New Hampshire, Virginia, Connecticut, and Missouri. Report C of the American Medical Association (AMA) Council on Ethical and Judicial Affairs (CEJA) was also reviewed. An analysis of the information resulted in a preliminary report that defined the issue to be studied by the committee as follows: Self-referral is the situation in which a physician refers a patient to a health care provider (business) in which s(he) has a financial interest, but does not perform any of the professional services.

The committee took the following position on self-referral:

- ✦ Self-referral, with disclosure of the financial relationship, is ethical.
- ✦ Excessive utilization for the purpose of the physician's financial benefit is unethical whether or not it involves self-referral.
- ✦ Self-referral is not illegal as long as it conforms to the terms of existing law.
- ✦ Underutilization in order to avoid the physician's financial loss is also unethical regardless of whether there is self-referral.

At the committee's second meeting, CEJA's Report E concerning conflicts of interest (self-referral) was reviewed along with information from the Medical Society of Virginia, a review of joint ventures among health care providers in Florida, a study on self-referral conducted by Charles River Associates, and articles from the *Journal of the American Medical Association* (i.e., "Consequences of physicians' ownership of health care facilities—Joint ventures in radiation therapy," "Increased costs and rates of use in the California Workers' Compensation System as a result of self-referral by physicians," "'Self-Referral'—What's at stake?," "Physicians' utilization and charges for outpatient diagnostic imaging in a Medicare population," and "Physician ownership of physical therapy services"). After this meeting, the committee made the following four-part proposal:

- ✦ Whereas legislation produces regulation that increases the cost of medical care and, ultimately, has a negative impact on the consumer;

  Whereas federal legislation is pending that will address this issue, and state legislation will be a redundant regulatory burden; and

  Whereas the Medical and Chirurgical Faculty of Maryland (Med Chi) believes that physicians can regulate themselves;

  Therefore, for the above reasons, Med Chi believes that state legislation on self-referral would be unnecessary.
- ✦ That Med Chi support the report of the Council on Ethical and Judicial Affairs of the American Medical Association on the issue of self-referral as accepted by the House of Delegates at the AMA interim meeting in December 1992.
- ✦ That Med Chi establish a standing committee on self-referral to implement the AMA position and to adjudicate specific situations.
- ✦ That the Ad Hoc Committee on Self-Referral be dissolved since it has completed its assigned duties.

At its meeting of January 21, 1993, Council approved all the committee's recommendations.

During the 1993 legislative session, HB 1280 was introduced. This bill prohibited a health care provider from referring a patient to a health care entity in which the health care provider, the provider's immediate family member, or the provider in combination with his or her immediate family member owns a beneficial interest or has a compensation arrangement. There were certain exceptions in the bill, penalties were established, and a study concerning self-referral was to be instituted.

Med Chi opposed the legislation, and the chairperson of this committee testified in Annapolis before the House Environmental Matters Committee on February 24, 1993. The chairperson stressed Med Chi's efforts in this area, and informed the Environmental Matters Committee of Med Chi's position and its endeavor to set up a standing committee to address self-referral problems. The legislation passed despite Med Chi's opposition to a law that increased health care costs, limited accessibility, interfered with the physician/patient relationship, and placed unnecessary regulatory burden upon a health care system already drowning in regulatory paperwork and administrative hassles.

As a result of the committee's recommendation to establish a standing committee, the members of the ad hoc committee were asked to continue their membership on the Ad Hoc Proactive Committee on Self-Referral. In addition, a bylaw change was submitted to the Bylaws Committee recommending that the self-referral committee become a standing committee.

❑ ❑ ❑

Ad Hoc Proactive Committee on Self-Referral

Mr. President and Members of the House of Delegates:

The Ad Hoc Proactive Commitee on Self-Referral was formed in February 1993 with members from the Ad Hoc Committee on Self-Referral. The charge to the new committee was

> An Ad Hoc Proactive Committee on Self-Referral shall be appointed by the president, who will give primary consideration to those members who served on the 1992 Ad Hoc Committee on Self-Referral. The committee shall utilize self-referral guidelines of the AMA Council on Ethical and Judicial Affairs to review and analyze specific situations. The committee shall be authorized to receive inquiries from physicians requesting whether an arrangement meets the AMA guidelines. The committee may review, as necessary, any complaints wherein there is an allegation of inappropriate physician self-referral. The committee shall determine the mechanism for conducting its business and the matter by which self-referral situations may be referred to the committee.

The purpose of the committee's initial meeting was to conduct a brainstorming session to determine how the committee would function. Members reviewed information on medical review committees, Report C of the Council on Ethical and Judicial Affairs (CEJA) of the American Medical Association (AMA), current law regarding patient referrals, and articles addressing self-referral and federal initiatives.

The committee decided it should be a medical review committee as defined in the Maryland Medical Practice Act, Health Occupations Article, Section 14-501. The criteria for review would be those identified in Resolution 4—approved by the AMA House of Delegates on December 8, 1992—which reaffirms CEJA's Report C, "Conflicts of Interest: Physician Ownership of Medical Facilities" (Policy 140.961) and requests that CEJA continue to study and revise these guidelines as changes in the health care system may require. The guidelines adopted by the committee are

- ✦ In general, physicians should not refer patients to a health care facility outside their office practice at which they do not provide care or services directly if they have an investment interest in the facility.
- ✦ Physicians may invest in, and refer to, an outside facility "...if there is a demonstrated need in the community for the facility and alternative financing is not available." A list of 10 criteria may be used to support this exception.

The committee further determined that self-referral situations from two sources would be reviewed: (1) complaints referred to the committee by the Board of Physician Quality Assurance (BPQA) and (2) requests for review by physicians or health service entities in operation or planning a new venture. The committee's opinion would be provided to the requesting physician for appropriate use and, in the case of a complaint, to the BPQA for action under the category of an ethical issue (unprofessional conduct).

After extensive deliberation, the committee recommended that Med Chi explore the feasibility of amending current legislation to provide that BPQA refer complaints regarding self-referral to Med Chi's self-referral committee.

❑ ❑ ❑

Committee on Specialist Identification

Mr. President and Members of the House of Delegates:

The Committee on Specialist Identification held four meetings this past year to implement the mandated specialist identification authority of the Board of Physician Quality Assurance (BPQA). This committee functions as the BPQA reviewing body on applications received from physicians requesting designation in a particular medical specialty.

Application for specialty designation is open to all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the BPQA upon confirmation of that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the particular specialty.

Applications are referred by the BPQA to this committee for evaluation. Evaluation criteria were developed jointly by Med Chi and the BPQA and are set forth in administrative regulations (COMAR 10.32.08) having the force and effect of law. The BPQA makes the final decision on the basis of the committee's recommendation. The identification is permanent, and the physician may publicize himself or herself in the given area of specialty.

Much time and effort has been exerted in reviewing the 2,917 applications received thus far. Of the applications reviewed, the committee has recommended that 298 be denied. Each application is reviewed thoroughly, fairly, and in strict compliance with the required criteria. As chairperson, I wish to thank committee members for their patience in carrying out this mandated function.

❑ ❑ ❑

Committee on Specialty Societies

Mr. President and Members of the House of Delegates:

The Committee on Specialty Societies is composed of representatives from various Maryland specialty societies as chosen by the Med Chi president. The committee is charged with reviewing issues concerning interdisciplinary and multidisciplinary problem areas of medical practice as related to each specialty. The committee provides specialty representation to the Med Chi Council and House of Delegates.

During the 1992-1993 year, the committee held three meetings at which the following issues were raised. The committee continued to address membership criteria for the Committee on Specialty Societies. This is an ongoing issue that was discussed at the May 1993 meeting of the Med Chi House of Delegates and will continue as an agenda item for the committee during the 1993-1994 year.

The committee reviewed two publications. The first was the newsletter of the Committee on Therapeutic Education—*EQUAL=TIME*—dealing with metered dose inhalers and nonsteroidal anti-inflammatory drugs.

The committee also spent a good deal of time reviewing a draft publication entitled *Medical Treatment Never Includes Sexual Contact.* The committee was informed that the idea for the publication was presented to Council by the Committee on Physician Rehabilitation in 1991. Council recommended that the Peer Review Management Committee, the Committee on Specialty Societies, and the Committee on Mental Health, along with the Maryland Psychiatric Society, review the publication and return with a recommendation for Council discussion and action. All aforementioned committees reviewed the publication and recommended publication.

Much of the discussion by the Committee on Specialty Societies was in opposition to publishing and distributing the proposed pamphlet. Many committee members expressed feelings that the pamphlet was inflammatory. There was also strong objection to distributing the pamphlet to patients and to language in the resources section of the pamphlet that stated, "You may also seek counsel from your personal attorney."

Some discussion ensued regarding reformatting the information into more of a Med Chi policy statement for physicians only. The committee was informed that HB 389, passed and signed into law, would create a task force to study health care provider–client sexual exploitation.

Throughout the year, the committee was kept abreast of a number of Med Chi activities presented before Council. These included the discussion on the hiring of a lobbyist and the discussion of the pamphlet, *Medical Treatment Never Includes Sexual Contact.*

❑ ❑ ❑

Sports Medicine Subcommittee

Mr. President and Members of the House of Delegates:

The Sports Medicine Subcommittee was reactivated during the 1992-1993 year with seven new members. One of the first issues the subcommittee addressed was a sports physical examination checklist that had been promulgated by the Maryland Chapter, American Academy of Pediatrics (AAP). The subcommittee found the evaluation form more than adequate for performing sports evaluations and relayed this information to the Maryland Chapter, AAP. This review led the subcommittee to query Maryland school systems to determine the type of forms required for sports evaluations. While each school system asked similar questions, the length and depth of the sports evaluations varied. Therefore, the subcommittee is investigating the feasibility of a uniform sports evaluation form.

The Committee on Public Health requested the subcommittee to address the issue of a physical fitness project in schools. In response to this directive, the subcommittee reviewed a number of wellness programs in operation in several school systems, school physical fitness programs, and fitness programs promulgated by the Boy Scouts and Girl Scouts. The extensiveness of the programs varied, as well as the programs' focus and the age groups targeted. Discussion of this initiative continues.

In response to a request from the Committee on Medicine and the Performing Arts, David L. Kreisberg, M.D., gave a presentation entitled "Conditioning and Physical Fitness for Performers: The Performer as an Athlete."

The subcommittee looks forward to expanding its activities next year. It plans to work cooperatively with component medical societies on various projects.

❑ ❑ ❑

Committee on Therapeutic Education

Mr. President and Members of the House of Delegates:

The former Ad Hoc Therapeutic and Formulary Committee was established as a standing committee by action of the House of Delegates on May 2, 1992. This action was a result of the House of Delegates adopting the recommendation of the By-laws Committee to change the committee's name to reflect the educational focus of the committee and to establish it as a standing committee.

The purpose of the renamed Committee on Therapeutic Education shall be to develop informational and educational programs for physicians regarding effective and cost-efficient prescribing practices. The committee will aid the Medical Assistance program in analyzing the effectiveness of "therapeutic formularies" and endeavor to ensure that any preauthorization mechanism is acceptable to Med Chi. The committee may cooperate with and invite government and private agencies working in the pharmaceutical field and invite the attendance of physician and nonphysician members of such agencies to work with the committee on a nonvoting basis.

With approval from the Executive Committee, the Committee on Therapeutic Education designed a therapeutic drug use newsletter for distribution to physicians providing care for Medicaid patients. The newsletter is entitled *EQUAL=TIME, Prescribing with the WHOLE Story*. Members of the committee reviewed and approved the dissemination of *EQUAL=TIME* newsletters on metered-dose inhalers and nonsteroidal anti-inflammatory drugs.

A number of activities are planned for the 1993-1994 year. One is the discussion of cough/cold products and compounded prescriptions.

Committee members

❑ ❑ ❑

Women in Medicine Committee

Mr. President and Members of the House of Delegates:

During the 1992-1993 year, the Women in Medicine Committee encouraged the participation of women physicians in Med Chi. The committee also worked to promote women's health issues.

In an effort to ensure that women physicians feel welcome in the organized medicine family, the committee initiated action on special gender issues affecting women physicians—family leave policy and language neutrality. Because the committee thought that women physicians who are planning to have a family may often feel discriminated against, the committee presented a family leave resolution to Council, and the following policy was adopted:

> *Resolved,* That the policy of the Medical and Chirurgical Faculty of Maryland reflect the need of physicians to take family leave and to encourage the medical community to support the concept of family leave for both male and female physicians.

Because gender-biased language continues to exist in medicine and may cause women physicians to feel unwelcomed, the committee recommended that Med Chi adopt a policy of gender-neutral language and incorporate it in all official written and verbal communications, using the American Medical Association (AMA) Board of Trustees Report K (A-92) as a guideline. This recommendation was passed by Council and has been incorporated into all aspects of Med Chi communications.

The committee also provided women physicians an opportunity to meet new colleagues by initiating a Women in Medicine Month brunch, the first of which was held on Sunday, September 27, 1992. The AMA encourages state and local medical societies to recognize September as Women in Medicine Month. The brunch was set-up as an informal discussion and allowed physicians to discuss issues faced by women in medicine. All female Med Chi members were invited and encouraged to bring spouses and nonmember women physicians. There were 31 attendees at the brunch, which the committee plans to make an annual event.

In an effort to provide education to the membership on women's health issues, the committee sponsored a presentation at the 1993 Med Chi annual meeting entitled "Estrogen Use

and Coronary Artery Disease in Women." Trudy Bush, Ph.D., M.H.S., associate professor, Department of Epidemiology, the Johns Hopkins University School of Hygiene and Public Health, discussed the correlation between coronary artery disease and estrogen use in women.

The committee also continues to support Maryland Elder C.A.R.E., a Med Chi membership benefit providing planning assistance for the complex needs and responsibilities of elderly relatives. A representative from Maryland Elder C.A.R.E. staffed a booth at the 1993 annual meeting to explain the program's benefits to Med Chi members.

The members of the committee thank Med Chi for the opportunity of serving on this committee. We welcome any comments or suggestions for future activities from all physicians.

Committee on Young Physicians

Mr. President and Members of the House of Delegates:

The 1992-1993 year prompted reorganization of the Committee on Young Physicians under the leadership of Mehrdad (Mike) Massumi, M.D. who spearheaded an initiative to provide programs of interest to young physicians. The committee's first venture into this area consisted of reviewing areas of interest to young physicians: managed care, public relations, accounting, purchasing, billing and collections, marketing, and legal issues.

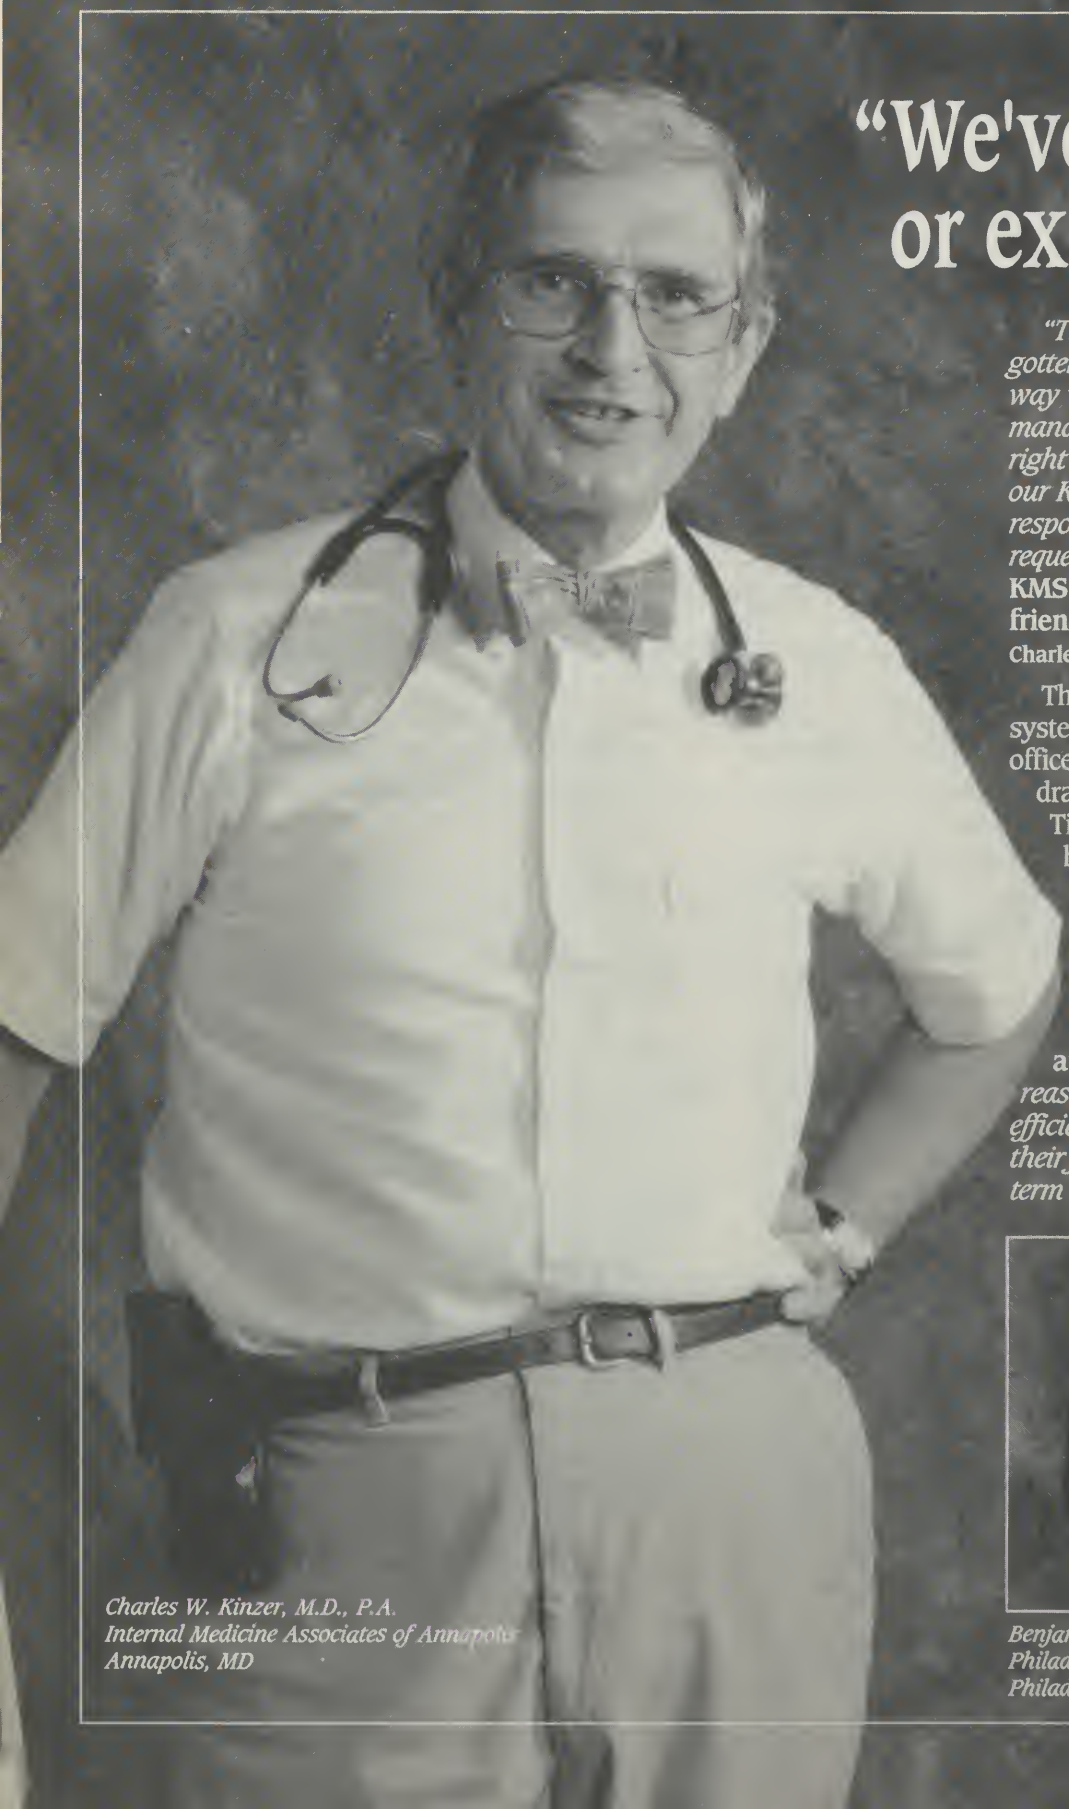
To begin this endeavor, the committee met with Scott Weber, Medical Communications Network, to solicit support and expertise for this undertaking. As a result, Medical Communications Network sponsored a practice management luncheon for young physicians at Med Chi's 1992 annual meeting in College Park. The luncheon presentation was entitled "Practice Management Strategies for Young Physicians."

Another initiative discussed was arranging for two or three speakers to go into hospitals to address young physicians on how to set up a practice. Efforts in this area will continue in the coming year.

The chairperson, who has been a member of the American Medical Association (AMA) Young Physicians Section for three years, presented the Young Physicians Section report of the AMA Interim Meeting. Highlights of the meeting centered on the following topics:

- ✦ Young physician exclusion from managed care networks;
- ✦ Economic credentialing by insurance companies;
- ✦ Medicare new physician disparities;
- ✦ Emergency preparedness for natural disasters;
- ✦ Providing health care directive information to Medicare/Medicaid beneficiaries;
- ✦ Mainstreaming of the young physician section into the AMA;
- ✦ Ethical treatment of young physicians;
- ✦ Primary health manpower needs; and
- ✦ Young physician position on the AMA Board of Trustees.

It was noted that Med Chi currently supports the participation of a young physician at AMA meetings. This provides a young physician an opportunity to participate in fundamental discussions about timely and critical matters related to the societal, political, and financial well-being of young physicians.



The committee discussed and reviewed the AMA *Health Care Reform 1993 Campaign Action Kit.* This kit provided an excellent workbook for physicians and presented information about writing to legislators on the issue of health system reform.

In the coming year, the committee hopes to focus on young physician recruitment. It also plans to offer seminars that will benefit young physicians.

systems and realize we can't grow—our computer from Keystone."

Carol Matthews, President
Lebanon Medical Management, Inc.
Lebanon, PA

"We've been with Keystone for over eight years. They've always provided us with options as we've grown and done whatever it takes to keep the system up and running. **Their support is worth every penny."** **Carol Matthews**

Keystone has designed a system that allows you to start with the basics (Accounts Receivable, Billing, Practice Analysis and Electronic Claims) and add on other capabilities as you need them. KMS gives you a total picture of your involvement with the patient—and provides you with all pertinent information easily and instantaneously. Among the KMS modules receiving praise from the industry and our clients are Patient Scheduling, Intelligent Payment Posting, and Credit and Collections.

"We were searching for a company sophisticated enough to support the growing demands of our company, and we found that in Keystone. **The KMS Credit and Collections module saves us 25% in manhours.** *It allowed us to convert from a manual collections system that took forever to a computerized system—without having to change our collections style one bit."* **Cindy Groux**

"Their system ties all of our offices together, *letting us keep track of everything that goes on—every facet of the practice—electronically. We feel secure that the business end is running expertly and efficiently. When I think how inaccurate we might have been before KMS, I know we couldn't survive now without it."*

AMA-ERF

Mr. President and Members of the House of Delegates:

It is with much pleasure that I offer this report of Med Chi members' contributions for the year 1992-1993 to our one and only philanthropy—the American Medical Association Education and Research Foundation—better known as AMA-ERF.

This program is unique in that it is solely designed to lend a measure of financial support to Maryland medical schools. These flexible funds aid the schools in their continued efforts toward achieving a goal of medical excellence.

Med Chi members have responded loyally and generously, for which I extend a sincere and heartwarming thank you. Looking forward, I am hopeful that new, incoming Med Chi members will lend their support to this program so that AMA-ERF will continue to survive and thrive.

Let me offer my sincere thanks to President Jose Yosuico, M.D., for affording me the great privilege of serving as state AMA-ERF chairperson for Med Chi during his tenure in office. And, to the competent and capable Med Chi staff, I am most appreciative of all of the kindness and consideration I have received during the past year. Thank you so much.

Faculty contributions
June 1, 1992-April 30, 1993

Allegany County	$620.00

Maryland physicians' direct contributions
1992-1993

$6,820.00

Chairperson Elizabeth A. Linhardt

Auxiliary

Mr. President and Members of the House of Delegates:

The 1992-1993 Med Chi State Auxiliary year commenced with the auxiliary president, Mrs. Myrna Goodman, traveling to various counties to install new auxiliary officers. (It was nice to meet new faces and see auxiliary friends from across the state. The hard work they put into their community health projects is appreciated. The diversity in backgrounds and talents makes the Med Chi State Auxiliary a special organization.)

At the national auxiliary annual convention in Chicago, Mrs. Myrna Goodman was presented as Maryland's state auxiliary president along with other state presidents from across the country. It was an impressive ceremony attended by more than 700 delegates and guests. Mrs. Goodman's husband Stuart, son Jacob, and six Marylanders witnessed the event. It was the 70th anniversary for the American Medical Association Auxiliary (AMAA), and the 40th year for Hazel Lewis, the AMAA executive director.

The proposed name change from American Medical Association **Auxiliary** to American Medical Association **Alliance**, with the tag line, "Physician spouses dedicated to the health of America," was presented to the AMAA House of Delegates. An immediate ballot vote was called. The resolution passed, effective June 1993. Each state must now make a decision as to whether to change the name of its state organization from auxiliary to alliance.

The state auxiliary president attended the Fall Confluence along with three other Maryland auxilians. In November, Myrna Goodman held, in her home, a confluence overview that was open to all auxilians. Confluence attendees shared what they had learned at the Chicago meeting.

"Awareness is Prevention" was the state auxiliary's health motto for the year. Breast cancer awareness and the prevention of violence were specifically addressed. At the auxiliary's fall House of Delegates meeting, the auxiliary sponsored a speaker from the Life Crisis Center in Salisbury, which offers help to victims of domestic violence. Auxilian Karen Mausner gave a second, well-received self-defense seminar.

A statewide campaign was undertaken to put up billboards stating "One in Nine—Mammography. Your Best Weapon." Med Chi sponsored the first two billboards, which were displayed on Route 50 in September. The billboards were visible to those attending the Med Chi semiannual meeting in Ocean City. County medical societies also displayed billboards in conspicuous places.

Four membership/treasurer workshops were held early in the fall. They were coordinated by Mrs. Pat Thompson and Mrs. Madrian Snyder.

At the auxiliary's winter board meeting, a reconstructive surgeon spoke on the various options one can elect after mastectomy. Darlene Young, AMAA field director, gave an informative membership workshop.

On March 29, 1993, the auxiliary received a proclamation certificate, signed by Governor Schaefer, designating March 30 as Doctors' Day; March 30 is also National Doctors' Day. (The self-defense seminar for caregivers scheduled for March 31 in honor of Doctors' Day was postponed indefinitely.)

At the annual convention, a presentation on domestic violence was offered on April 29, 1993, and on May 1, a presentation on breast cancer prevention. As the culmination to the auxiliary's breast cancer prevention efforts, free mammograms for over 30 indigent women were performed in May with the aid of the University of Maryland mobile van. Special thanks go to Adriana Zarbin and the Baltimore City Auxiliary for the $2,000 donation.

The auxiliary continues to maintain a good rapport with Med Chi members and staff. Dr. Jose Yosuico, Med Chi president, and Angelo Troisi, executive director, were instrumental in making it possible for the auxiliary to receive the Governor's Citation Award for the auxiliary's legislative work. Myrna Goodman accepted this award on behalf of the auxiliary at Med Chi's semiannual meeting in Ocean City.

Also at the semiannual meeting, MMPAC Chairperson John Lynn, M.D., spoke to auxiliary members about political action pertaining to health care issues and its importance in the legislative process. In mid-January, the auxiliary had a successful legislative day in Annapolis. President Goodman attended a Legislative Induction Ball of the Prince George's County Medical Society in late January. On March 18, physicians and spouses went to Annapolis for a media rally to express concerns about various proposals including HB 1359; this bill to cap physicians' fees was amended.

The auxiliary president participated in the Charles County Medical Society summer business meeting at Andrews Air Force Base and installed the auxiliary officers. Med Chi's Eastern Shore meeting was held in Cambridge, and Mildred Taylor represented the auxiliary. Myrna Goodman represented the auxiliary at the President's Southern Regional Meeting held in Solomon's Island on April 1; she gave an update on auxiliary activities.

The annual state auxiliary convention was held at the University of Maryland in College Park on April 29 and 30. Priscilla Gerber, AMAA president, installed the new officers. Mildred Taylor, president-elect for the Southern Medical

Association Auxiliary (SMAA), spoke about the SMAA. The auxiliary's annual meeting finale was the singing of "Heal the World," led by Lori Snyder, for Lee Snyder, founding member of the Physicians' Children Volunteer Corps; Jacob Goodman and Chancellor Blair also helped lead in this song. At the luncheon, which was attended by around 90 auxilians and guests, Dr. Joseph Snyder, Med Chi president-elect, presented certificates of appreciation to Priscilla Gerber, Mildred Taylor, and Myrna Goodman. At the House of Delegates meeting on May 1, Mrs. Goodman gave an auxiliary update and accepted another certificate of appreciation on behalf of the state auxiliary for having had a great year.

Myrna Goodman went to Chicago to present the year-end report. Georgia Lizas, Adriana Zarbin, Mildred Taylor, Naomi Klein, and Jo Ann Troisi traveled with her.

President Goodman gave a thank-you luncheon at her home on June 3. Helen Boyer, the auxiliary parliamentarian for years, shared her wisdom pertaining to parliamentary procedures, job descriptions of officers and chairpersons, and responsibilities of delegates to the AMAA convention. Socks for the elderly and needy of the PVNC Nursing Home were generously donated by fellow auxilians—Mrs. Goodman's optional request for the nursing home where she volunteers.

As auxiliary president, I offer my profoundest thanks to all auxiliary board members for their outstanding work this past year; many willingly went above and beyond the call of duty. I wish to extend my appreciation to Drs. Yosuico and Snyder and to Med Chi members and staff, particularly Executive Director Troisi, for their support and help. Many thanks as well to the auxiliary's very own Jo Ann Troisi for serving as a guiding light and for being a dear friend. To many of my friends and colleagues within the auxiliary, I extend my gratitude for your endless energy and devotion to auxiliary activities this past year. To Pat Thompson and Madrian Snyder, many thanks for conducting the four membership/treasurer workshops. To Georgia Lizas, many thanks for your support. To Georgine Welty and Elizabeth Linhardt, my deepest appreciation for your inspiring longevity and dedication to the auxiliary. To Mary Strauss for conducting another successful annual meeting auction for the AMA-ERF (American Medical Association Education and Research Foundation) and for providing a lot of fun and laughter—many thanks.

Last but not least, my endless thanks to my better half, Stuart, "the wind beneath my wings," for his friendship, love, and support, and for believing in me. To Jacob, my huggable son, thanks for taking my absences from home as opportunities to do and get "anything he wishes." No! I will not slow down. I will continue to make a difference. Together we will communicate, educate, and legislate to help "make a better place for the entire human race."

State Auxiliary President Myrna Goodman, R.N.

❑ ❑ ❑

Mildred Taylor; Priscilla Gerber, AMA Auxiliary president; Myrna Goodman; and Elizabeth Linhardt participate in the 44th annual meeting of the Med Chi Auxiliary.

Executive Director

Mr. President and Members of the House of Delegates:

The 1992-1993 year brought a newly defined focus to the profession of medicine. Med Chi found that the intensified attention to health system reform raised questions from patients, insurers, legislators, and physicians alike. Through legislative and educational efforts, Med Chi faced the current issues with support from its officers and members. This report highlights the past year's accomplishments.

1993 legislative session

The 1993 legislative session provided many challenges for Med Chi. A very active legislative team was created and, by way of a newsletter, *Legislative Action*, kept Med Chi members informed of events in Annapolis. More than 8,400 copies of this weekly publication were mailed to the Med Chi and component societies leadership. On March 18, 1993, more than 100 physicians attended the Med Chi legislative rally in Annapolis to express their views regarding health system reform and other legislative issues. House Bill 1359, Maryland's Health Care and Insurance Reform Bill, was of greatest concern this year, but Med Chi physicians and staff worked diligently on many important health care issues. For a detailed account of the 1993 legislative session, see the Legislative Committee report.

Anti-smoking campaign

Med Chi initiated an innovative anti-smoking campaign to assist physicians in warning patients about the dangers of smoking. The campaign began with the development of an educational program entitled "How to Help Your Patients Stop Smoking."

It was enhanced this year by the broadcast of an anti-smoking public service announcement on local television stations and the production of a warning label targeting the advertising of tobacco products. The tobacco warning labels were distributed to physicians starting in January 1993. The labels were to be placed on physicians' waiting room magazines containing tobacco advertising. The labels contained the following message: "Warning: This magazine contains cigarette advertisements. Your physician does not support the use of any tobacco products or advertising of such products." The campaign received recognition and praise from the American Medical Association (AMA) and attracted the attention of many other state medical societies.

Med Chi also undertook another anti-smoking effort. Maryland legislators and their office staff were invited to attend a special session of "How to Stop Smoking" on March 24, 1993, at the Maryland Inn in Annapolis.

Responding to Maryland's budget cuts

Late in 1992, Maryland was forced to cut $50.2 million from the state's medical assistance programs for the poor. It was estimated that 30,000 of the state's Medicaid clients who did not qualify for federal aid would not receive health care benefits. In addition, local health departments were slated to lose $15.1 million. Med Chi worked with the Maryland Association of County Health Officers (MACHO) and the Department of Health and Mental Hygiene (DHMH) to meet the needs of Medicaid recipients.

Med Chi Council passed a resolution encouraging component medical societies to work with county and city health departments to provide volunteer physicians for needed medical services that would no longer be available. Med Chi also encouraged Governor William Donald Schaefer to restore funds to the local health departments.

Membership survey

Med Chi surveyed over 1,800 Med Chi physicians in August to ascertain their attitudes about membership benefits, various health care issues, and physician practice pattern issues. A total of 899 physicians responded to the survey—a 51% response rate. Questionnaires were returned by physicians in every Maryland county.

New policy on gender-neutral language

On November 19, 1992, Med Chi Council adopted a policy of incorporating gender-neutral language into all written and verbal communications. The new policy was adopted because Med Chi recognizes and encourages contributions from women physicians and is committed to eliminating gender-related barriers. The new policy is based on the AMA Board of Trustees Report K (A-92) that, in summary, recommends

- That the AMA adopt a policy of gender-neutral language, to be incorporated into its bylaws, policies, procedures, and publications during the normal process of printing and updating/reprinting documents.
- That the term "chairman" no longer be used to designate the head of a committee, and that the term "chair" or "chairperson" be used instead.

- That the AMA encourage state, county, and national medical and specialty societies to review their bylaws and policies and eliminate gender-biased language where it exists.

Blue Cross and Blue Shield

Three top executives from Blue Cross and Blue Shield of Maryland (BCBSM), Frank A. Gunther, Jr., chairperson of the board; William Beasman, acting chief executive officer; and Arthur T. Keefe, Jr., M.D., executive vice-president and medical director, met with Med Chi physicians on February 24, 1993, to discuss physician concerns regarding BCBSM. Following that meeting, Med Chi physicians were updated on the situation at BCBSM through a regular feature in the *Maryland Medical Journal.*

Annual meeting

The 1993 annual meeting was held April 29, 1993, through May 1, 1993, at the University of Maryland University College Conference Center, College Park, Maryland. Raymond Scalettar, M.D., chairperson of the AMA Board of Trustees was a special guest at a forum on health system reform. This forum, which addressed the state initiative, HB 1359, as well as federal initiatives, included the Honorable Casper R. Taylor, Jr., chairperson of the House Economic Matters Committee, Maryland House of Delegates, and the Honorable Gary R. Alexander, vice-chairperson of the House Economic Matters Committee, Maryland House of Delegates.

Also at the annual meeting was a special session on mustard gas disposal entitled "Clearing the Air About Poisonous Gas." The program was coordinated by the Maryland Chapter, American College of Emergency Physicians, and was presented by the Centers for Disease Control and Prevention.

Semiannual meeting

The 1992 semiannual meeting was held September 18, 1992, through September 20, 1992, at the Princess Royale Hotel, Ocean City, Maryland. Another forum on health system reform at the state and federal levels was held as the plenary session. Joseph Painter, M.D., president-elect of the American Medical Association, provided the keynote address.

Special conferences

Two president's regional conferences were held to keep open the lines of communication with Maryland's outlying areas. One was held in western Maryland on Thursday, October 22, 1992, at the Sheraton in Hagerstown. A second conference was held on the Eastern Shore on Thursday, November 5, 1992, at the Cambridge Yacht Club in Cambridge.

The Physician Rehabilitation Program sponsored a conference, "Third Annual Conference on Addiction: Physician Health and Education." It was held on Saturday, November 21, 1992, at Med Chi.

The Committee on Medicine and the Performing Arts conducted a conference on the special problems of performing artists, "Performing Arts Medicine II: Focus on Young Performers." The program was held March 20-21, 1993, at Med Chi.

Med Chi sponsored training sessions to help physicians and their office staff comply with federal regulations on occupational exposure to bloodborne pathogens. More than 500 physicians and their office staff benefited from these sessions.

In addition, there were seminars on the processing of the new Health Care Financing Administration (HCFA) 1500 claim form and updates on HCFA's Medicare fee schedule changes. Continual updates on the Clinical Laboratory Information Act (CLIA) changes were also provided.

On behalf of the staff of Med Chi, I would like to thank Med Chi members for all their contributions during the 1992-1993 year. We look forward to working with you in 1993-1994.

Executive Director Angelo J. Troisi, FACHE

❑ ❑ ❑

The Maryland Medical Political Action Committee

Mr. President and Members of the House of Delegates:

The Maryland Medical Political Action Committee (MMPAC) met only twice during 1992, but the MMPAC Executive Committee held several conference calls to discuss contributions to political fund-raisers. The annual physicians' day in Annapolis was well attended and gave physicians the opportunity to speak to individual legislators about important health care legislation.

MMPAC held elections for its Executive Committee. The following individuals will serve a two-year term:

- Chairperson Frederick J. Hatem, M.D.
- Immediate Past Chairperson John T. Lynn, M.D.
- Vice-Chairperson Hillary T. O'Herlihy, M.D.
- Treasurer Jose M. Yosuico, M.D.
- Secretary Hiroshi Nakazawa, M.D.
- Member-at-Large Joseph Snyder, M.D.
- Member-at-Large J. Richard Lilly, M.D.

Angelo Troisi will serve as advisor to the MMPAC Executive Committee and the MMPAC Board of Directors. Both the

smaller components and the four larger Med Chi components are represented on the MMPAC Executive Committee.

The purpose of MMPAC, as stated in MMPAC's bylaws under Article II, Sections 2, 3, and 4, is as follows:

> **Section 2.** To encourage its members to understand the nature and actions of their government; to inform them of important legislation and political issues affecting the medical profession; to present to its members the record of office holders and candidates for elective office.
>
> **Section 3.** To assist its members in organizing themselves for effective political activity and civic responsibility.
>
> **Section 4.** To lend support to and work for the nomination and election of any candidate for public office representing the best interests of the public and medicine's viewpoint.

Every physician should be aware of the legislative process at the state and federal levels. This was highlighted during the 1993 Maryland legislative session and by the publicity surrounding the health system reform activities of the Clinton administration.

To this end, every physician should be an MMPAC member. MMPAC should use its resources not only for financial contributions to candidates, but in working with component societies to gather information about candidates and to provide components with information obtained from resources of a statewide organization.

Med Chi staff are assembling complete voting records of state legislature members, as well as other information that will help MMPAC determine the extent of support it should provide. MMPAC works with all components to provide information and elicit input; working together allows MMPAC to achieve the purpose for which it was organized.

During the 1993 legislative session, the importance of good communication between legislator and medicine was obvious. MMPAC needs the support of each Maryland physician. Please join those who already are involved with their money and talents.

Because of changes in congressional districts, MMPAC is in the process of reorganizing its board of directors and is considering possible changes to its bylaws. With 1994 being an important election year, MMPAC would like to maximize its resources for efficient operation and successful undertakings.

The next meeting of MMPAC will be held in September 1993 during the Med Chi semiannual meeting in Ocean City. We hope to see you there.

Med Chi Insurance Fund

Mr. President and Members of the House of Delegates:

The Med Chi Insurance Fund Committee and Board of Directors met five times during 1992 to carry out its responsibilities for the Med Chi Insurance Fund and the Med Chi Agency. The Med Chi Agency continued its new business growth, and expanded its staff to accommodate additional opportunities in the disability and life insurance sectors of the operation. All lines of insurance are currently offered and available to members, including estate and financial planning services.

The board approved a new Blue Cross/Blue Shield plan option effective September 1, 1992, bringing the total number of plan options to four. In addition, participants within the other three options can transfer to the new Option 4 without medical underwriting during open enrollment each September. The Med Chi Agency also offers alternative health plans for members who elect not to participate in the Blue Cross/Blue Shield Association group plans.

The board reviewed the appropriate financial statements and claim report statistics with company representatives. As a result of this review, the board approved a 20% premium increase for the Hartford major medical plan.

The client base of the Med Chi Agency increased in property and casualty and in professional liability with the Medical Mutual Liability Insurance Society of Maryland (Med Mutual). Commission income is projected to decline in 1993 due to special discounts and tail buy-backs offered to Medical Mutual policyholders.

The Med Chi Agency had a very successful year and membership has benefited as a result. The board is appreciative of members' ongoing support and will strive diligently to offer the highest quality, financially stable, and competitively priced products and services for Med Chi members.

Treasurer

Mr. President and Members of the House of Delegates:

The financial books and records of Med Chi for the year ending December 31, 1992, have been audited by the firm of Naden/Lean, Certified Public Accountants. The financial statements reflecting the financial position of Med Chi at year end 1991 and 1992 and the related statements of income, expenditures, transfers, and changes in fund balances for the year then ended are published in this *Maryland Medical Journal.* The auditors submitted an unqualified opinion that the financial statements are accurate and conform to generally accepted accounting principles.

The 1993 budget was referred to the Executive Committee in November 1992 and approved by the committee in January 1993. It is also presented in this *Maryland Medical Journal* for informational purposes.

Treasurer Albert L. Blumberg, M.D.

❑ ❑ ❑

OCCUPATIONAL THERAPY
PHYSIATRY CONSULTATION SERVICE

Providing Rehabilitation Services including specialties in the areas of:

SPINE REHABILITATION
- Spinal evaluation and treatment
- Back School Education
- Postoperative back evaluation and treatment

ORTHOPEDICS
- Postoperative joint rehabilitation
- Rehabilitation of musculoskeletal injury
- Foot Orthotic evaluation/fabrication
- Prosthetic training
- TMJ

PEDIATRICS
- Evaluation and treatment of premature infants through adolescents
- Cystic Fibrosis Pulmonary and Exercise Programs

NEUROSCIENCES
- Chronic Pain Management
- Evaluation and treatment of neurological disorders
- Geriatric Fall Precautions Screening
- Multiple Sclerosis Patient Screening

MEDICINE
- Geriatric Assessment
- Arthritis evaluation and treatment
- High Risk Pregnancy
- AIDS Rehabilitation

SURGERY
- Amputee Rehabilitation
- Early postoperative intervention
- Postoperative organ transplantation rehabilitation

ONCOLOGY
- Rehabilitation Post Bone Marrow Transplantation
- Leukemia Rehabilitation

CARDIAC REHABILITATION
- Postoperative intervention
- Postoperative Heart, Lung and Heart/Lung Transplant Rehabilitation
- Phase 1 Cardiac MI program

PSYCHIATRY
- Pediatrics through Geriatrics
- Inpatient, Day Hospital, Outpatient

HANDS
- Static and Dynamic Orthotics
- Hand Surgery/Cumulative Trauma Rehabilitation

QUALITY
THE HOPKINS TRADITION

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/ Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

To volunteer or for more details, call Med Chi's Public Relations Department at 410-539-0872 1-800-492-1056.

INDEPENDENT AUDITORS' REPORT

The Medical and Chirurgical Faculty
of Maryland
Baltimore, Maryland

We have audited the accompanying balance sheets of the Medical and Chirurgical Faculty of Maryland (the "Faculty") as of December 31, 1992 and 1991, and the related statements of revenue and expenses, changes in fund balances, and cash flows for the years then ended. These financial statements are the responsibility of the Faculty's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with generally accepted auditing standards. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of the Medical and Chirurgical Faculty of Maryland at December 31, 1992 and 1991, and the results of its operations, changes in fund balances, and cash flows for the years then ended, in conformity with generally accepted accounting principles.

Our audits were conducted for the purpose of expressing an opinion on the basic financial statements taken as a whole. The supplementary information is presented for purposes of additional analysis and is not a required part of the basic financial statements. Such information has been subjected to the procedures applied in the audits of the basic financial statements and, in our opinion, is fairly stated in relation to the basic financial statement taken as a whole.

Information for the year ended December 31, 1991 is presented for comparative purposes only and was extracted from the financial statements presented by Fund for that year, on which an unqualified opinion dated May 13, 1992, was expressed.

Notes to Financial Statements

December 31, 1992

Note 1—SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

Entity

The Medical and Chirurgical Faculty of Maryland (the "Faculty") is a nonprofit organization, tax exempt under Section 501(c)(6) of the Internal Revenue Code. The Faculty is not classified as a private foundation.

Fund Accounting

The accounts of the Faculty are maintained in accordance with the principles of fund accounting whereby resources are classified for accounting and reporting purposes into funds established according to their nature and purpose. Separate accounts are maintained for each fund; accordingly, the assets, liabilities, and fund balances are recorded in self-balancing funds as follows:

- *General Funds*—used to account for revenues and expenses related to the operation and management of the Faculty's general operations. Certain board designated amounts are also reflected in this fund.
- *Endowment and Special Funds*—used to account for resources which are available for use, but expendible only for the purposes specifically designated by the donor.
- *Plant Fund*—used to account for the Faculty's investment in fixed assets.
- *Med Chi Insurance Fund*—used to record billing and disbursement transactions related to the administration of insurance activities.
- *Restricted Funds*—used to account for revenues and expenses related to the Physician's Rehabilitation, Baltimore Substance Abuse, March of Dimes, AMA—Health Access America, and Maryland Diabetes Control programs.

Description of Major Programs Supported Through Restricted Funds

Physician's Rehabilitation Program. The goal of this program is to identify physicians unable to practice medicine with reasonable skill and safety due to physical or mental illness, including alcoholism or drug dependence, and to provide assistance to the physician in obtaining rehabilitation, either through private or public sources.

The Physician's Rehabilitation Program is available to all physicians in the State of Maryland, their family members, and medical students.

Funds from this program are also used to perform peer reviews of physicians who are referred to the Faculty by the Board of Physician Quality Assurance.

Baltimore Substance Abuse Program. This program was established to develop a curriculum for primary care physicians on how to screen, counsel, and refer their substance-abusing patients. This curriculum will be presented to local hospitals, community health centers, and the like. The goal of this program is to provide this information to all primary care physicians in Baltimore City.

March of Dimes Program. The purpose of this program is to conduct a continuing medical education program for practicing physicians that will enable them to help their pregnant patients stop smoking. Presentations were held at area hospitals.

AMA—Health Access America Program. This program supports Med Chi's outreach program to inform Maryland physicians of a proposal developed by the American Medical Association (AMA) to improve access to affordable, quality health care in the United States. This proposal is designed to control health care cost increases, reform Medicare and Medicaid, and insure that all Americans have access to health care.

Maryland Diabetes Control Program Demonstration Project. This project involves designing, implementing, and evaluating a demonstration project that shows the effectiveness of a physician's office-based and patient-initiated system to remind practitioners to provide certain clinical services during a diabetes-related physician visit.

Cash and Cash Equivalents

Cash consists of cash and cash equivalents such as overnight investments, money market accounts, and certificates of deposits with a maturity of less than one year. Some of these deposits with financial institutions exceed federally insured limits.

Fixed Assets

Fixed assets are stated at cost or, if donated, at the approximate fair value at the date of donation. Depreciation is computed for fixed assets acquired prior to 1981 using the straight line method over the estimated useful lives of related assets. For assets acquired subsequent to 1980, depreciation is computed using the accelerated cost recovery or modified accelerated cost recovery systems based on the estimated useful lives of the related assets.

Depreciation expense for the years ended December 31, 1992, and 1991 was $171,637 and $137,062, respectively.

Marketable Securities

Marketable securities are carried at lower of cost or market. Market values at December 31, 1992, and 1991 were $3,422,256 and $3,256,595, respectively.

Investment in Subsidiaries

The Faculty carries its investment in its 100% owned subsidiary, Med Chi Agency, Inc. (the "Agency"), at equity. The net assets of the Agency as of December 31, 1992, and 1991 were as follows:

	1992	1991
Current assets	$299,902	$158,836
Fixed assets—net	29,036	22,130
	328,938	180,966
Current liabilities	108,746	67,473
	$220,192	$113,493

The Agency generated net income for the years ended December 31, 1992, and 1991 of $400,561 and $326,327, respectively.

The Faculty carries its investment in the 100% owned Management Services Corporation of Med Chi, Inc. (the "Corporation"), at equity. The net assets of the Corporation as of December 31, 1992, and 1991 were $12,772.

Allocation of Expenses

Expenses are charged to each program based on direct expenditures incurred. Indirect expenses are allocated to the various programs based on management's estimate of employee time allocations and in accordance with the various grant agreements.

Deferred Income

Deferred income reflects dues and fees collected as of the Balance Sheet date, related to the subsequent year.

Financial Statement Presentation

Certain amounts in 1991 have been reclassified to conform with the 1992 presentation.

NOTE 2—FIXED ASSETS

Fixed assets at December 31, 1992, and 1991 are summarized as follows:

NOTE 3—WRITE-DOWN OF LOANS RECEIVABLE

At 12/31/91, the Faculty wrote-off $172,835 of loans receivable from Healthcare Credentials Verification, Inc. The receivables were considered uncollectible since they were unsecured and due to the cessation of Healthcare Credentials Verification, Inc.'s operations. Additionally, the Faculty wrote-off $53,204 of loans receivable from Maryland Foundation for Health Care which were not considered collectible due to financial difficulties experienced by the company.

NOTE 4—PENSION PLAN

The Faculty sponsors a noncontributory defined benefit pension plan (the "Plan") that covers substantially all employees of the Faculty and its subsidiaries who have attained the age of 21 and completed one year of service. The Plan calls for benefits to be paid to eligible employees at retirement based on the average compensation for the five highest consecutive years of credited service.

The Faculty's funding policy is to fund pension costs accrued. Actuarially determined pension costs are funded on an annual basis by the Frozen Initial Liability Method with initial accrued liabilities compensated under the Entry Age Normal Tax Method.

Plan assets consist primarily of common and preferred stocks, corporate bonds, mutual funds, and short-term investments.

The following table sets forth the plan's funded status and amounts recognized in the Faculty's balance sheets at December 31:

	1992	1991
ACTUARIAL PRESENT VALUE OF BENEFIT OBLIGATIONS:		
Accumulated benefit obligation		
Vested	$582,418	$477,504
Non-vested	55,855	64,035
	638,273	541,539
Effect of anticipated future compensation levels and other events	233,721	257,571
Projected benefit obligation for service rendered to date	871,994	799,110
Plan assets at fair value	1,379,684	1,307,304
Plan assets in excess of projected benefit obligation	507,690	508,194
Unrecognized net (gain) loss	14,103	(30,054)
Unrecognized net transition asset (from adoption of FASB Statement No. 87)	(295,369)	(307,665)
Prepaid pension cost recognized on balance sheet	$226,424	$170,475

Actuarial pension expense for 1992 and 1991 includes the following components:

	1992	1991
Service cost of the current period	$96,347	$71,035
Interest cost on the projected benefit obligation	61,128	59,476
Estimated return on assets held in the plan	(72,393)	(220,470)
Net amortization and deferral	(57,560)	114,713
Net periodic pension expenses	$27,522	$24,754

Actuarial assumptions used in determining the actuarial present value of the projected benefit obligation were as follows:

	1992	1991
Weighted-average discount rate	8%	8%
Rate of increase in future compensation	4	4
Expected long-term rate of return on assets	9	9

NOTE 5—RELATED PARTIES

The Medical and Chirurgical Faculty of Maryland owns the stock of The Med Chi Agency, Inc. The Faculty leases office space to the Agency under a month-to-month lease. Lease payments from the Agency were $30,000 and $18,336 for 1992 and 1991, respectively. Additionally, the Faculty performed certain management and accounting services for the Agency. Income for these services amounted to $144,500 and $121,000 in 1992 and 1991, respectively.

The Medical and Chirurgical Faculty of Maryland owns the stock of Management Services Corporation of Med Chi, Inc. There were no charges to the corporation in 1992 and 1991 for management and accounting services performed by the Faculty for the corporation.

NOTE 6—COMMITMENTS

The Faculty entered into an agreement with Dr. Jane Eliot Sewell to have Dr. Sewell write a book dealing with the history of medicine in Maryland. The contractual cost for the writing of this publication is $76,500. It is the intention of management for the Ruhrah Fund, in the endowment and special funds, to incur the costs of this publication. Anticipated future payments to be made, based on agreed upon completed chapters of the book, are as follows:

Year Ended December 31	Amount
1993	$13,517
1994	17,000
1995	17,000
1996	17,000
1997	7,083

Call for Papers

1994 International Conference on Physician Health
September 16-20, 1994. Ottawa, Ontario, Canada

"Stress: The Profession, the Family and You"

The 1994 International Conference on Physician Health, co-sponsored by the American Medical Association, the Federation of State Medical Boards, the Canadian Medical Association, and the Federation of Medical Licensing Authorities of Canada is scheduled for September 16-20, 1994, at the Ottawa Westin Hotel.

Ottawa is Canada's capital and offers many national museums, over 60 miles of bicycle paths, hiking in Gateneau park, squash courts and swimming at the hotel and golf nearby.

The conference will provide a forum for practitioners and researchers to present recent findings and innovative treatment and education programs in physician health. This conference will address a range of issues, such as AIDS, HIV, problems related to aging, mental illness, substance abuse and physical disabilities and limitations, including those caused by general medical conditions. Possible topics for presentation include: presentation and treatment of health problems among physicians, the impact of disorders on physicians' families and practices, medical-legal issues facing hospital administrations and licensing boards, and material on health promotion and disease prevention. *Abstracts which address issues related to these topics (i.e., prevention, diagnosis, treatment, rehabilitation), but not dealing specifically with physicians are also welcome.*

Three types of presentations regarding these physician health issues are invited:

- **Poster Presentations**
  Written presentations of data-based research, epidemiological research, or program descriptions.

- **Paper Sessions**
  Oral presentation of scientific, data-based findings relative to the topic of physician health.

  Abstracts for poster presentations and paper sessions should contain an introductory statement on the significance of subject matter. Description of methods, results, and conclusions should follow the introductory statement.

- **Workshops**
  Training or instructional presentations, designed to improve specific skills of persons who work in the area of physician health.

  Abstracts for workshops should contain information on the program's intended audience, goals, teaching strategies, and materials. Evaluation data should be summarized

Abstracts may not exceed 200 words. Any abstracts exceeding that length will be rejected. Abstracts should be typed, double spaced, and mailed (not faxed). Four copies of the abstract should be sent, along with one self-addressed, stamped envelope. All submissions must list the primary and secondary authors and their professional affiliations. Telephone number and address of primary author must also be included.

Submissions *must* be received by February 1, 1994.

Abstracts will be submitted for blind review. Abstracts will be judged on their applicability to the conference topic area and their scientific merit. The decisions of the blind reviewers will be communicated to the abstract's primary author by April 1, 1994.

All presenters are expected to register for the conference at the AMA member rate. We are unable to provide any financial support for presenters. Presenters will also be responsible for their own transportation and hotel expenses, as well as making all reservations for same.

Send all materials to:
Elaine M. Tejcek, Physicians Health Foundation, American Medical Association, 515 N. State Street, Chicago, IL 60610.

Introducing A Bill That Actually Gets Smaller Over Time.

Yours.

The older your receivables get, the less they're worth. Between 90 and 180 days, the value of past due receivables decreases ½% every day.

And, at 180 days, your receivables are worth one third of the original value. That's only 33¢ on the dollar.

Don't wait to collect what's yours. Put I.C. System to work for you. We're endorsed for debt collection services by more than 1,000 business and professional associations nationwide, including yours.

Call I.C. System today.
Before your money shrinks to nothing.

Information for AUTHORS

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

Miscellaneous meetings

Imaging the augmented breast, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Sept. 2**

1993 Med Chi semiannual meeting, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Vivian Smith, 410-539-0872 or 800-492-1056. — **Sept. 10–12**

The decade of the brain: An international conference, sponsored by the George Washington University, at the Omni-Shoreham, Washington, DC. 28 Cat 1 AMA/PRA credits. Fee: $550 physicians; $330 residents and fellows; $250 other health professionals. Info: John F. Vargo, 202-994-4285. — **Sept. 11–14**

5th annual trauma conference, sponsored by the Peninsula Regional Medical Center, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Darlene Kwiatkowski, 410-543-7328. — **Sept. 16–17**

14th international congress of lymphology, sponsored by the International Society of Lymphology (ISL). Part 1: "Frontiers in Lymphology" at the Hyatt Regency, Baltimore, Maryland. Part 2: "Lymphology in 1993" at the Ramada Renaissance Techworld, Washington, DC. Info: Grace Wagner, program coordinator, 602-626-6118. — **Sept. 20–26**

Congenital heart disease in adolescents and adults, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Sept. 27–29**

Interventional echocardiography: Transesophageal, exercise, pharmacologic, and intravascular, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Sept. 30–Oct. 2**

International liver symposium, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 14 Cat 1 AMA/PRA credits. Fee: $350. Info: Hattie Johnson, 202-687-8735. — **Oct. 1–3**

Clinical cardiac electrophysiology, pacemakers, and cardioverter-defibrillators, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 4–7**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Oct. 7**

Gastroenterology board review course, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 42 Cat 1 AMA/PRA credits. Fee: $650 physicians; $500 residents and fellows. Info: Daniel E. Reichard, 202-994-4285. — **Oct. 9–13**

Medical oncology board review course, sponsored by the George Washington University, at the Ritz-Carlton, Pentagon City, Virginia. 38 Cat 1 AMA/PRA credits. Fee: $695 physicians; $500 residents and fellows. Info: John F. Vargo, 202-994-4285. — **Oct. 9–13**

Clinical applications of Doppler and transesophageal echocardiography, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 14–16**

New techniques and concepts in cardiology, sponsored by the American College of Cardiology, at the Hyatt Regency Hotel, Washington, DC. 16 Cat 1 AMA/PRA credits. Info: 1-800-257-4739. — **Oct. 21–23**

Miscellaneous meetings (continued)

Nuclear cardiology: A case study approach, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 21–23**

Cancer in women conference, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 21 & 28 and Nov. 4 & 11**

Vascular radiology conference, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 23**

7th annual national disability management conference and exhibit, sponsored by the Washington Business Group on Health, at the Crystal Gateway Marriott, Arlington, Virginia. Info: Kristina Tanasichuk, 202-408-9320. — **Oct. 25–26**

Topics in clinical rheumatology: An arthritis update for internists, family practitioners, orthopaedists, rheumatologists, other primary care practitioners, and allied health professionals, sponsored by the Arthritis Foundation, Maryland Chapter, at the Stouffer Harborplace Hotel, Baltimore, Maryland. Cat 1 AMA/PRA credits available. Fee: $50. Info: J. Karen Krug, 410-602-0160. — **Oct. 28**

Cases in echocardiography: TEE, Doppler, and stress—Interpretation and clinical decision making for the advanced echocardiographer, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 28–30**

Cardiology in women, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 29**

The future of integrated health care systems, sponsored by The Healthcare Forum and Inova Health System, and in part by a grant from KPMG Peat Marwick, at the Hyatt Regency, Reston, Virginia. 13.25 Cat 1 AMA/PRA credits. Info: 415-421-8810. — **Nov. 8–11**

Advanced echocardiography: Case studies and concepts, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Dec. 1–3**

Continuously throughout the year — **Dec. 13–15**

Fluorescein angiography conference, sponsored by the Retina Center, St. Joseph Hospital, Baltimore, Maryland, first and third Mondays of each month; 8:00-9:00 am. Fee: none. Info: R. Classon, 410-337-4500.

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, Maryland 21205 (410-955-2959).

Pediatrics for the practitioner—Update 1993. Cat 1 AMA/PRA credits available. — **Sept. 9–10**

7th annual core content of emergency medicine: A comprehensive review, at the Marriott Hotel, Baltimore-Washington International Airport, Baltimore, Maryland. Cat 1 AMA/PRA credits. Fee $995. — **Sept. 10–16**

The Johns Hopkins Medical Institutions (continued)

22nd annual diagnostic ultrasound in gynecology and obstetrics and abdomen, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 16.5 Cat 1 AMA/PRA credits. Fee: physicians: 3 days, $400; 2 days, $300; 1 day, $150. **Sept. 17–19**

Rising to the challenge: Crisis intervention in the critical care setting. Cat 1 AMA/PRA credits available. Fee: $75. **Oct. 4**

19th annual topics in gastroenterology and liver disease. Cat 1 AMA/PRA credits available. Fee $495 physicians; $250 residents and fellows. **Oct. 6–8**

35th annual Emil Novak memorial course. 45 AMA/PRA credits; 53 ACOG cognates. Fee: $675 physicians; $475 residents, fellows, and allied health professionals. **Oct. 18–23**

Diabetic retinopathy. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 29**

Practical management of the uveitis patient. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. **Oct. 30**

Hemodynamic monitoring, patient care and pulmonary artery catheterization—A hands-on course. 14 Cat 1 AMA/PRA credits. Fee $575. **Oct. 30–31**

Ethics and politics related to clinical trials. Cat 1 AMA/PRA credits available. Fee: TBA. **Nov. 3–4**

Progress in pediatrics. 11 Cat 1 AMA/PRA credits. Fee: $140 physicians; $80 residents and fellows. **Nov. 5–6**

Update on sinusitis. Cat 1 AMA/PRA credits available. Fee: TBA. **Nov. 8**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, Maryland 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Cardiovascular risk factors in the elderly—medical and pharmacologic management, at the Baltimore Grand, Baltimore, Maryland. 7 Cat 1 AMA/PRA credits. Fee: $60 physicians. Info: Reba Cornman, 410-706-4327. **Oct. 5**

Selected Communicable Diseases in Maryland in 1992 - Continued

MALARIA (61)

1.3/100,000 (U.S. 0.4/100,000)

The number of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). Prince George's County had the highest incidence rate per 100, 000 population (3.8), followed by the rate in Montgomery County (2.7).

The male to female ratio was 1.3:1.0. The ratio of whites to non-whites was 0.1:1.0. Ages ranged from 2 to 66 years (median 31, mean 29 years). The most affected age group was 30 to 39 years (26 cases).

The reported malaria species were: *Plasmodium falciparum* (25), *P. vivax* (12), *P. malariae* (3), *P. ovale* (2), and unspecified (19).

All malaria cases in Maryland were imported either by persons who travelled abroad (49.1%) or by recent immigrants (50.9%). *P. falciparum* and *P. ovale* malaria were acquired in Africa, *P. vivax* in India, Africa, and Latin America, and *P. malariae* in India.

A recent review of 125 malaria cases reported in Maryland in 1991 and 1992 disclosed that 40% of cases had a history of previous malaria; 24% of the cases had received prophylaxis but only a quarter of these had received the appropriate regimen.

MEASLES (17)

0.4/100,000 (U.S. 0.9/100,000)

In 1992, reported measles decreased ten-fold from 1991 when 178 cases were reported. The trend in the past 10 years is presented in Figure 9. Only 5 counties reported cases (see Table 1, July 1993 issue); 76.5% were residents of Montgomery (7 cases) and Prince George's (6 cases) counties. The highest incidence rates per 100,000 population were also noted in Montgomery (0.9) and Prince George's (0.8) counties. Four cases in Montgomery County were part of an outbreak in a high school. Most of the cases had onset of illness in April and May.

The male to female ratio was 0.5:1.0; the ratio of whites to blacks was 1.3:1.0. Ages ranged from 7 months to 58 years (median 16 years). Two (11.8%) were children 0 to 15 months of age, 4 (23.5%) were 16 months to 4 years old, 4 (23.5%) were 5 to 19 years of age, and the rest (7) were adults. The 4 cases, 16 months through 4 years of age, had not been vaccinated against measles.

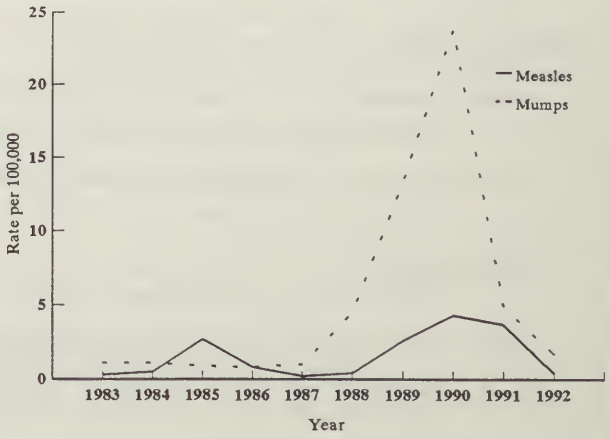

Fig 9. Measles and mumps. Incidence rates, Maryland, 1983-1992.

Nine (52.9%) of the cases were out-of-state or international importations. Two of the 6 adult cases were nurses who were exposed at work.

MENINGITIS, VIRAL (ASEPTIC) (223)

4.6/100,000 (U.S. 4.8/100,000)

Aseptic meningitis declined by 33% from 1991 (333 cases). The number of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). Almost half (48.9%) of the cases had onset of illness in July, August, and September.

The male to female ratio was 1.2:1.0. The ratio of whites to blacks was 2.4:1.0. Children under 1 year of age (41 cases, including 13 newborns), had the highest rate per 100,000 population (62.5). The rates among age groups 5 to 9 years (6.6) and 1 to 4 years (6.4) followed.

The etiology was reported for only 15 cases: 5 unspecified enterovirus, 5 echovirus, 4 herpes virus, and 1 lymphocytic choriomeningitis virus.

MENINGOCOCCAL DISEASE (31)

0.6/100,000 (U.S. 0.8/100,000)

The distribution of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). More than half (51.6%) were reported by Anne Arundel (6 cases), Montgomery (5), and Prince George's (5) counties. No cluster or seasonality was observed.

The male to female ratio was 1.2:1.0. The ratio of whites to blacks was 2.2:1.0. Ages ranged from 4 months to 78 years (median 9 years). The highest incidence rate per 100,000 population (4.6) was observed among children under 1 year of age, followed by the rate (2.7) among 1 to 4 years old.

Nineteen (61.3%) patients presented with meningitis, 11 (35.5%) with meningococcemia, and 1 (3.2%) with arthritis. The *Neisseria meningitidis* serogroup was reported for 15 cases as follows: 9 B, 4 Y, 2 W135, and 1 C. The outcome was known for 28 cases (90.3%) : 2 died for a case fatality rate of 7.1%.

MUMPS (84)

1.7/100,000 (U.S. 1.0/100,000)

The trend of decline for mumps which started in 1991 (236 cases) continued through 1992 (Figure 9). The number of cases in 1992 by jurisdiction is shown in Table 1 (see July, 1993 issue).

The male to female ratio was 1.2:1.0. Fifty-one (60.7%) of the cases were school-age children, 5 to 18 years of age.

PERTUSSIS (52)

1.1/100,000 (U.S. 1.6/100,000)

Pertussis decreased by 14.8% from 1991 (61 cases) following 2 years of consecutive decline. The trend in the past 10 years is presented in Figure 10. The number of cases by jurisdiction in 1992 is shown in Table 1 (see July 1993, issue).

The male to female ratio was 0.7:1.0. The ratio of whites to non-whites was 2.5:1.0. Ages ranged from 1 month to 50 years (median 3.5 years). The highest age specific incidence rate per 100,000 population (27.4) occurred among children under 1 year of age (18 cases, including 3 children under 28 days old), followed by the rates in age groups 10 to 14 years (2.8) and 5 to 9 years (1.4).

The following symptoms were reported: paroxysmal cough in 46 (88.5%), post-tussive vomiting in 29 (55.8%), whoop in 25 (48.1%), cyanosis in 12 (23.1%), and apnea in 11 (21.2%) cases. No deaths were reported.

Seventeen cases (32.7%) were laboratory confirmed by culture, 16 (30.8%) were DFA positive, 11 (21.2%) were both culture and DFA positive, and 19 (36.5%) were not tested but were epidemiologically linked to confirmed cases.

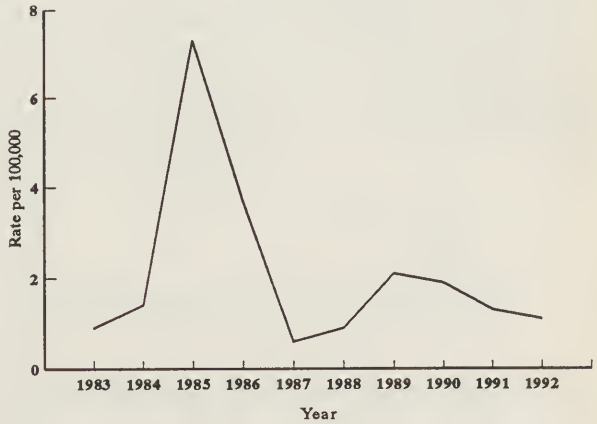

Fig 10. Pertussis. Incidence rates, Maryland, 1983-1992.

ANIMAL RABIES (553)

Laboratory confirmed animal rabies decreased by 4.5% from 1991 (579 cases) following 3 consecutive years of increase. It should be noted that these numbers, based only on the animals submitted for testing, do not reflect the full extent of infection especially within wild animal populations.

In 1992, 10.8% (553/5106) of laboratory examined animals were found to have rabies. The trend of animal rabies in Maryland in the past 12 years since the beginning of the current terrestrial animal (other than bats) epizootic, is reflected in Figure 11. Since the first case in 1981 in Allegany County, raccoon rabies has spread to all Maryland counties, except Somerset and Worcester on the lower Eastern Shore. The number of reported cases in 1992 by jurisdiction is shown in Table 1 (see July, 1993 issue). Dorchester (55 cases) and Wicomico (33 cases) were the only newly involved counties in 1992. Frederick County with the highest number of cases (79, 14.3%) had a third cyclic peak following an initial peak in 1984 (247) and a second peak in 1988 (66). In Maryland, cyclic peaks usually occur at 4 to 6 year intervals. Talbot County, the county newly involved in 1991 (54 cases), reported 63 cases (11.4%) in 1992.

Raccoons (413, 74.7%) were the most frequently reported rabid animal, followed by skunks (65, 11.8%), foxes (27, 4.9%), cats (22, 4.0%), bats (17, 3.1%), dogs (2, 0.4%), and horses (1, 0.2%). Rabies among dogs and cats (24 cases) accounted for 4.5% of the total, an in-

crease of 3.1% from 1991 (17 cases). The number of rabid cats (22) was the highest number ever reported in Maryland.

No human rabies has occurred in Maryland during this epizootic. The last human rabies death was in 1976, resulting from a bat bite.

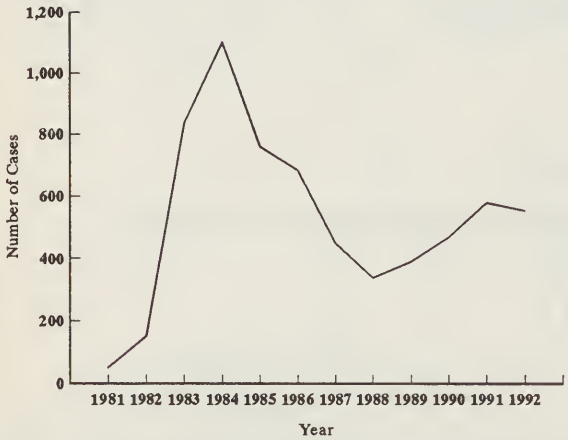

Fig 11. Animal rabies. Cases reported, Maryland, 1981-1992.

ROCKY MOUNTAIN SPOTTED FEVER (16)

0.3/100,000 (U.S. 0.2/100,000)

Rocky Mountain spotted fever declined 27.3% from 1991 to a record low. The number of cases in the past 5 years and by jurisdiction in 1992 is shown in Table 1 (see July 1993, issue). Only 1 case was reported from the Eastern Shore (Talbot County) and none from the counties west of Baltimore County. Five cases (31.3%) occurred in Baltimore County.

Onsets of illness were in April through October (peak month was July with 6 cases). Ages ranged from 4 to 60 years (median 28.5 years). The highest incidence rate per 100,000 population (1.1) was observed in children 5 to 9 years of age.

Eleven (68.8%) patients had rash, including 7 with rash on the palms and/or the soles; 4 (25.0%) confirmed cases and 1 probable case did not have a rash. Five (31.3%) patients required hospitalization. No deaths were reported.

Nine patients (56.3%) had tick bite, 5 (31.3%) had visited tick infested areas, 1 (6.3%) had no history of exposure, and 1 had no exposure information available.

RUBELLA (5)

0.1/100,000 (U.S. 0.1/100,000)

An outbreak of rubella in May occurring in an adult day care center involved 7 persons (4 staff members and 3 clients). Five of the cases were residents of Maryland, and 2 were from Pennsylvania.

The ages of the 7 cases ranged from 8 to 42 years; 6 were female and 1 was male. Two of the confirmed cases had documented evidence of prior rubella immunity. The source of infection was not identified. There was no spread in the community.

No congenital rubella syndrome was reported in Maryland in 1992.

SALMONELLOSIS (1021)

21.1/100,000 (U. S. 16.0/100,000)

The decrease by 19.1% from 1991 (1262 cases) continued the trend of decline of salmonellosis which followed the peak year 1987 when 1810 cases were reported (Figure 12). The number of cases by jurisdiction in 1992 is shown in Table 1 (see July, 1993 issue). Nine outbreaks involving 196 cases (88 of whom were laboratory confirmed and therefore included in the 1992 total) were reported by 8 counties. The peak months were August (148 cases) and July (130 cases).

The male to female ratio was 1.0:1.0. Among the 681 (66.7%) persons for whom the race was known the ratio of whites to non-whites was 1.2:1.0. Infants, under 1 year of age, including 10 under 28 days old, accounted for 162 (15.9%) cases, and had the highest incidence rate per 100,000 population (246.9), followed by the rates in age groups 1 to 4 years (56.3) and 5 to 9 years (16.9). Among adults the highest rate (15.4) was in age group 30 to 39 years.

Of the 730 (71.5%) isolates for which serotypes were available, 295 (40.4%) were *S. enteritidis* (compared to 30.9% and 37.1% in 1991 and 1992, respectively), 154 (21.1%) *S. typhimurium,* 50 (6.8%) *S. heidelberg,* 35 (4.8%) *S. hadar,* 28 (3.8%) *S. newport,* 15 (2.1%) *S. agona,* 12 (1.6%) *S. derby*, 11 (1.5%) *S. infantis,* and 130 (17.8%) other serotypes. Five of the 9 outbreaks were caused by *S. enteritidis*, 2 by *S. typhimurium,* and 1 by *S. newport.*

SHIGELLOSIS (430)

8.9/100,000 (U.S. 9.4/100,000)

Shigellosis increased 66.7% from 1991 (258 cases). The trend in the past 10 years is presented in Figure 12. The number of cases by jurisdiction in 1992 is shown in Table 1 (see July, 1993 issue). Seven outbreaks (compared to 3 in 1991) involving 103 cases (41 of whom were laboratory confirmed and therefore included in the 1992 State total) were reported by 5 counties.

The majority of cases (61.3%) occurred in July through November. The male to female ratio was 1.0:1.0. The ratio of whites to non-whites was 0.6:1.0; the race of 136 (31.6%) was unknown. The highest incidence rates per 100,000 population were noted in age groups 1 to 4 years (45.3), 5 to 9 years (25.5), and among infants under 1 year of age (13.7).

Of the 389 (90.5%) isolates for which species was known, 341 (87.7%) were *S. sonnei*, 47 (12.1%) *S. flexneri*, and 1 (0.3%) *S. boydii*. All 7 reported outbreaks were caused by *S. sonnei*. All occurred in child care settings in contrast with 1991 when none were associated with child care facilities.

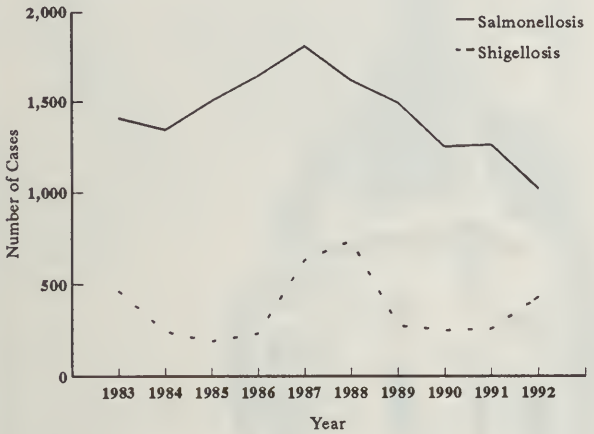

Fig 12. Salmonellosis and shigellosis. Cases reported, Maryland, 1983-1992.

SYPHILIS, PRIMARY AND SECONDARY (590)

12.2/100,000 (U.S. 13.6/100,000)

In 1992, primary and secondary (P&S) syphilis decreased 41.9% from 1991 (1016 cases). Figure 13 shows the trend of P&S syphilis in Maryland in the past 10 years. The number of cases by jurisdiction in 1992 is presented in Table 1 (see July, 1993 issue). Baltimore City (188 cases) and Prince George's County (182 cases) reported 46.8% and 45.3% of all cases, respectively.

The male to female ratio was 1.0:1.0. Seventy-four percent of the cases were black. The most affected age group (25 to 34 years) contributed 45% of all cases.

Since 1988, all P&S syphilis and early latent syphilis patients seen in local health departments' STD clinics have been offered testing for HIV. The percent of co-infection in those tested was 17.7% (66/372) in 1988, 16.0% (96/601) in 1989, 7.1% (69/974) in 1990, 10.8% (94/871) in 1991, and 11% (67/624) in 1992.

Congenital syphilis (62 cases) increased 14.8% from 1991 (54 cases). The following jurisdictions reported cases: Prince George's (27), Baltimore City (26), Montgomery (4), Wicomico (2), Anne Arundel (1), Charles (1), and Dorchester (1). The cases in Prince George's County decreased 27% from the previous year, while reported congenital syphilis in Baltimore City increased 190% from 1991 (9 cases). It is believed that the increase in Baltimore City is due to better ascertainment of cases after the adoption of the CDC's new congenital syphilis definition, rather than an actual increase in cases.

TUBERCULOSIS (442)

9.1/100,000 (U.S. 10.5/100,000)

Tuberculosis declined slightly from 1991 (451 cases). The number of cases by jurisdiction is shown in Table 1 (see July, 1993 issue). Baltimore City reported 28.7% of all cases, followed by Montgomery (21.5%) and Prince George's (19.9%) counties.

The ratio of males to females was 1.4:1.0. The ratio of whites to non-whites was 0.4:1.0. There were 27 (6.1%) cases in children under the age of 15 years; 130 (29.4%) were 65 years old and older. More than a quarter (122 cases, 27.6%) were born in foreign countries, including 80 who were born in Asia. Twenty-eight (23%) of the foreign born were refugees.

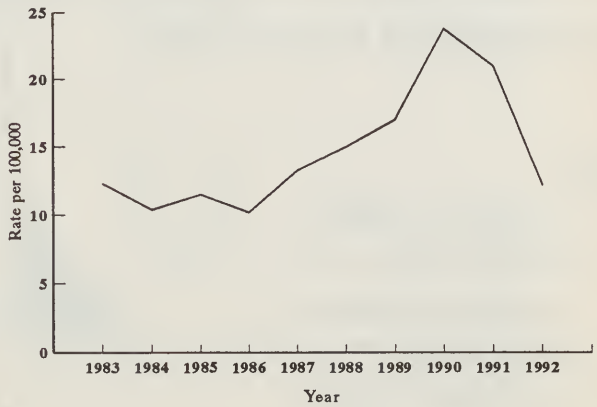

Fig 13. Primary and secondary syphilis. Incidence rates, Maryland, 1983-1992.

A match of tuberculosis and AIDS registries for 1992 identified 60 (13.6%) persons with both diseases (an increase from 36 (8.0%) in 1991, and 41 (10.7%) in 1990). Between 1978 and 1992, 179 such cases have been identified. Strains of drug resistant *M. tuberculosis* were noted in 39 (8.8%) patients of which 4 were resistant to at least INH and rifampin.

TYPHOID FEVER (7)

0.1/100,000 (U.S. 0.2/100,000)

Typhoid fever was reported from Montgomery (3), Prince George's (3), and Howard (1) counties. The male to female ratio was 0.4:1.0. Four cases were Asian, 2 Hispanic, and 1 was black.

Ages ranged from 3 to 59 years (median 11 years). All patients recovered. The cases were imported from India (3), Pakistan (1), Ghana (1), Ecuador (1) and the Philippines (1).

Corrections: In Table 1 in the July, 1993 issue, the number of typhoid fever cases should read as follows: Montgomery County - 3, Prince George's County - 3, and the total - 7.

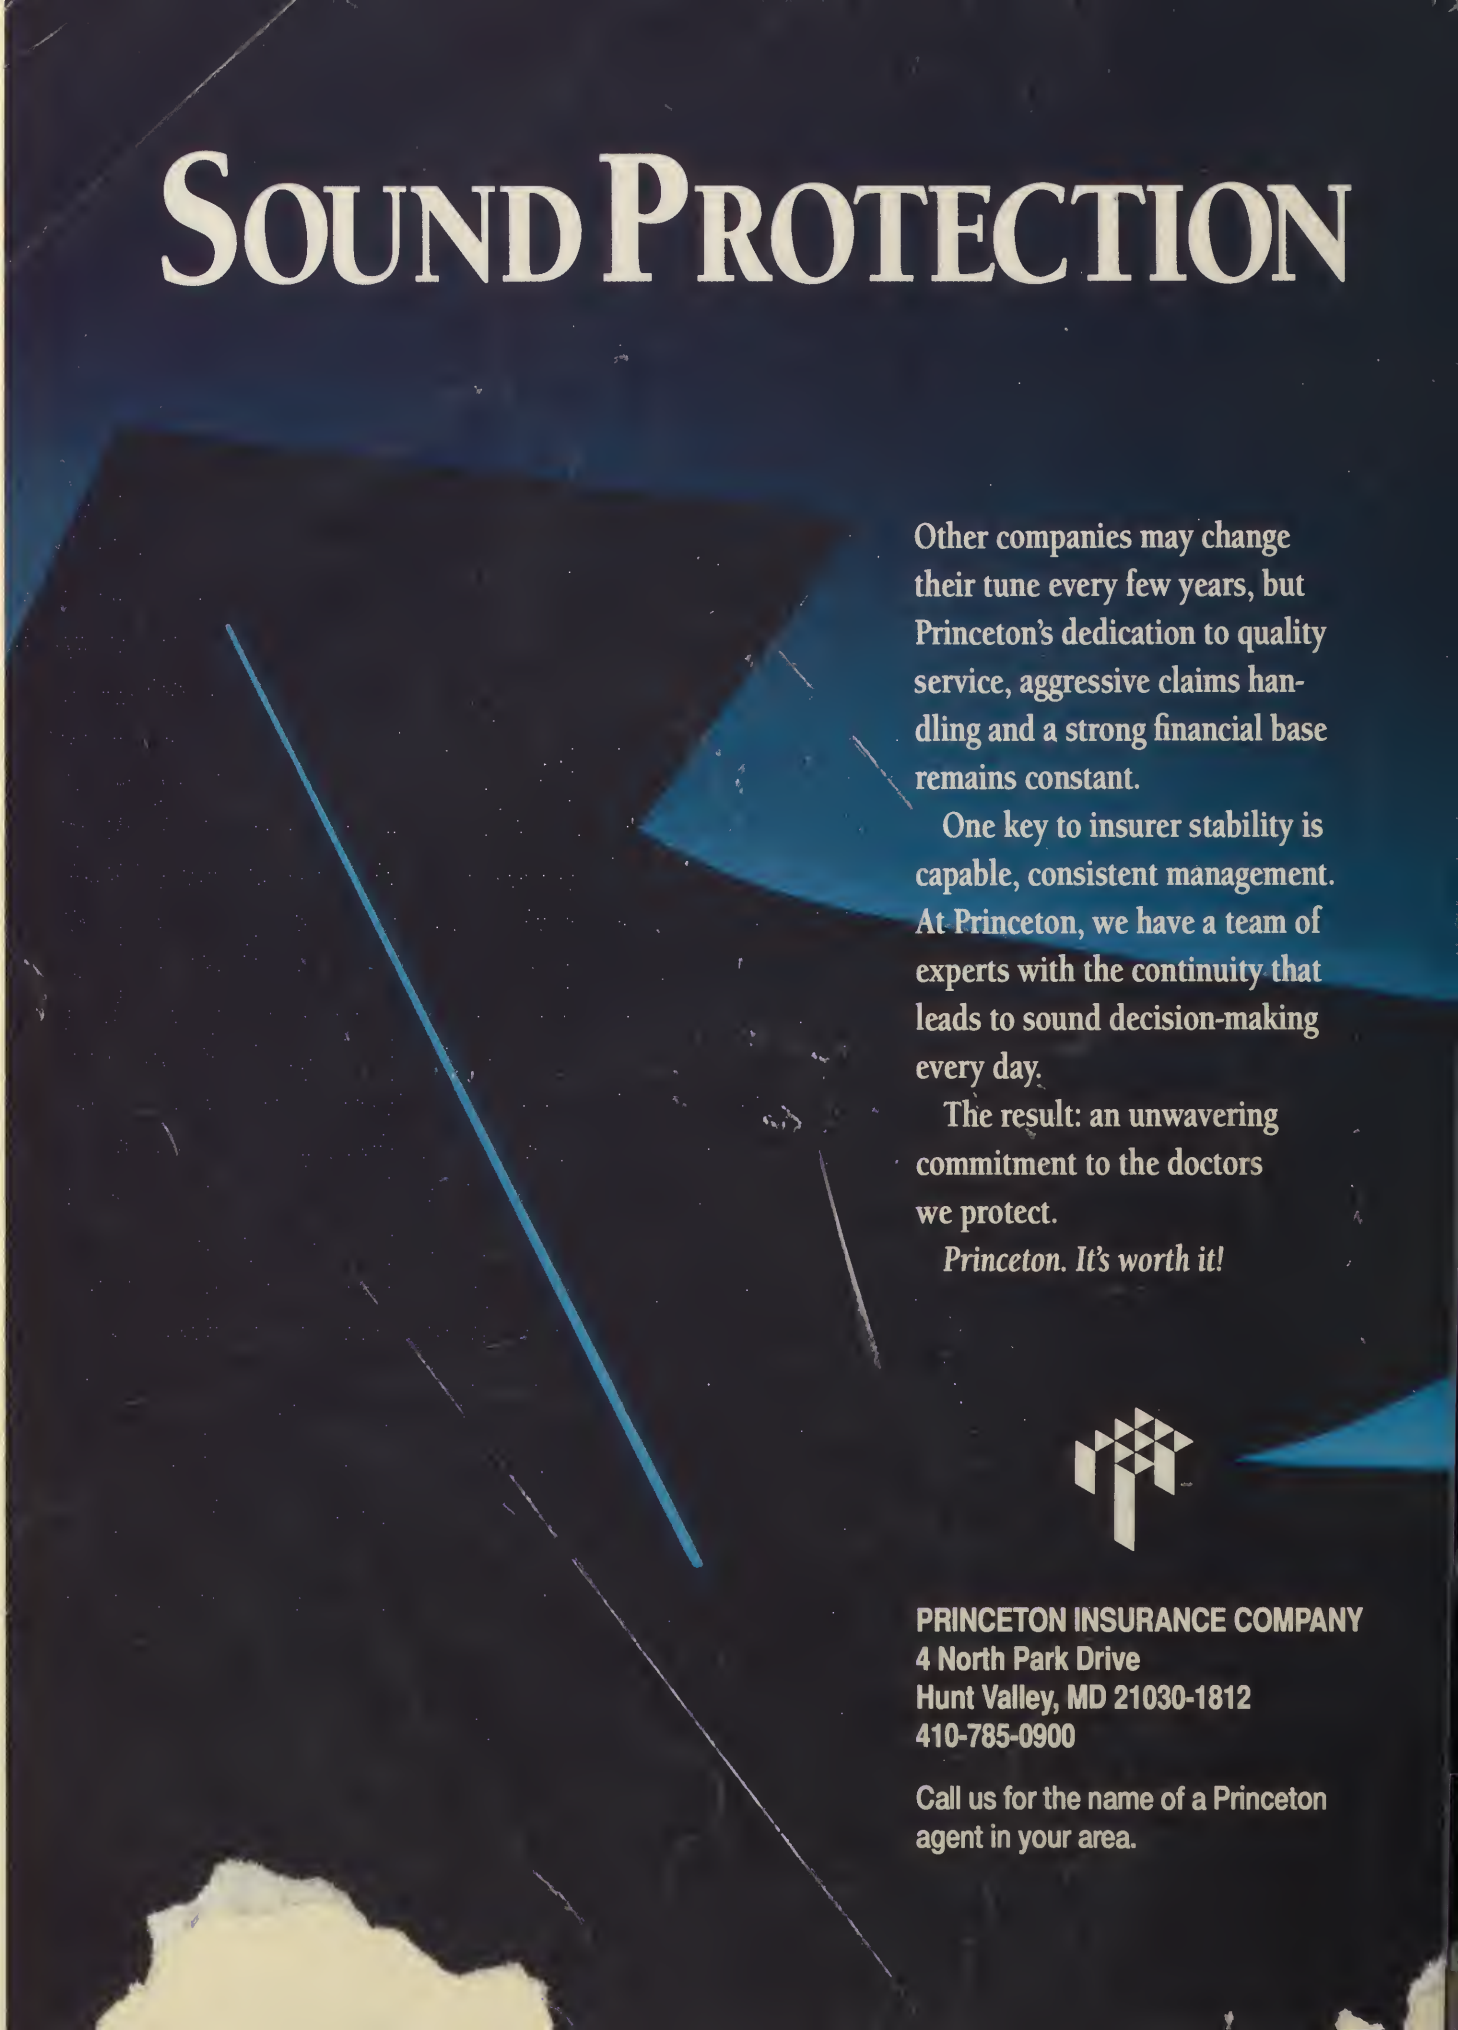
Malpractice Insurance

Not the most popular topic among physicians.

That's why many Maryland doctors turn to the Med Chi Agency team to obtain coverage that makes sense and affords the peace of mind needed to focus on what *really* interests them—their practice and their patients.

Started by doctors with doctors in mind, we at the Med Chi Agency know what physicians want and what physicians need when it comes to professional liability insurance.



Security. Competence. Proven Leadership.

The Med Chi Agency

Because we specialize in medicine too.

THIS STATE-OF-THE-ART SLEEP STUDY IS BEING CONDUCTED IN LOU JOHNSON'S BEDROOM.

Apnea events during sleep with desaturation from an actual home study.

At the Shady Grove Sleep Centers we are committed to bringing the resources of a well-equipped laboratory into the home environment. Although the results are not as complete as studies conducted in a conventional sleep lab, they are usually clinically diagnostic and considerably more pleasant and reassuring to the patient.

Shady Grove is fully accredited by the ASDA, and all tests are conducted by trained sleep technicians under the direction of Registered Technicians. Interpretations are performed by board-certified sleep physicians. We also operate the other facilities listed below.

Our technology includes nine-channel recording and review of raw data.

The several benefits of in-house sleep studies have been noted in a recent ASDA paper. We will welcome the opportunity to share them with you. Call us at 1•800•AWAKEN•1.

THE FACTS ABOUT MRI IN BLACK AND WHITE.

Independent tests and physician reports confirm that MR images generated by a 1.5 Tesla MR system are of a higher resolution and superior quality than those produced by an open-air, low-field system.

At the MRI Center at Saint Joseph Hospital, we believe in giving physicians and patients the best diagnostic imaging services available anywhere. Which is why our facility features a General Electric 1.5 Tesla MR system.

Better images result in better diagnoses. And that's what we're here to provide.

MRI CENTER

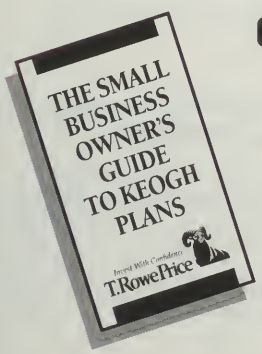
DEC. 31 DEADLINE

SELF-EMPLOYED?
DISCOVER THE *SIMPLIFIED* KEOGH

THE T. ROWE PRICE SIMPLIFIED KEOGH℠ OFFERS A STREAMLINED APPROACH TO RETIREMENT SAVINGS



Until now, small business owners and self-employed individuals looking for a Keogh often found plan setup and administration a hassle. Now, the T. Rowe Price Simplified Keogh makes this easier.

Maximum tax advantages with minimal effort.
The Simplified Keogh still lets you contribute pretax income of up to $30,000 that grows tax-deferred until withdrawal. But with our ready-to-adopt Keogh Profit Sharing Plan and Keogh Money Purchase Pension Plan, there is no lengthy application to complete. And you'll find running these plans simpler than most other Keoghs.

Flexibility now and in the future.
To set up your Keogh, you can choose from 33 of our no-load mutual funds. Whether your investment style is conservative or aggressive, whether you're planning to retire in 5 years or 25 years, you'll find investments to meet your retirement goals. And, as those goals change, you can adjust your investments with just a phone call.

The experience of retirement plan experts.
T. Rowe Price pioneered retirement plan administration for the mutual fund industry and continues to be a leader today. This expertise stands behind our Keogh plans. As a shareholder, you'll have toll-free access to our retirement specialists, who are available to answer investment *and* plan questions.

ELECTRONIC CLAIMS PROCESSING

President's Western Regional Conference

Thursday, November 11, 1993
Sheraton Hotel, Hagerstown, Maryland

This conference is for members in Garrett, Allegany, Washington, Frederick, and Carroll counties. Conference topics will include an update on legislative issues, Medical Mutual Liability Insurance Society of Maryland, Health Care Access and Cost Commission, Maryland Medical Political Action Committee, Medicare reimbursement, and Auxiliary activities. The meeting will also feature a one-hour continuing medical education presentation on:

"Pearls" of Rheumatology

Speaker: Ira T. Fine, M.D., chief, Division of Rheumatology, Sinai Hospital, and instructor of medicine, the Johns Hopkins University School of Medicine

Objective: Participating physicians will be aware of the different types of arthritis, appropriate diagnostic approaches, and appropriate therapeutic interventions.

CME credit: 1.0*

For more information about this conference, contact Joan Mannion at 410-539-0872 or 1-800-492-1056.

*The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty designates this continuing medical education activity for 1 credit hour in Category 1 of the Physician's Recognition Award of the American Medical Association.

ERISA Reform

Section 4301 of the Omnibus Budget Reconciliation Act of 1993 (OBRA 93) contains provisions to prohibit benefits discrimination against adopted children. This Employee Retirement Income Security Act (ERISA) reform policy was supported by the AMA and is now the law. Previously, ERISA, the federal statute that controls self-insured benefit plans nationwide, preempted state antidiscrimination laws that barred restrictions on coverage for adopted children.

S&I Services - Cardiologists and Radiologists - Medicare Payment, Pennsylvania Blue Cross/Blue Shield

A cardiologist who performs an interventional procedure, such as an entire coronary and peripheral angiography, angioplasty, or similar diagnostic and/or therapeutic procedure, will receive the supervision and interpretation (S&I) payment. The cardiologist in these situations would be supervising the radiological aspect of these procedures and interpreting the test results. When a radiologist becomes involved after completion of the procedure, the services are essentially quality control, and the radiologist would not be eligible for payment.

If, however, the radiologist is present during the procedure and supervises the radiological aspect, the radiologist, rather than the cardiologist, should submit the claim for the S&I payment.

Med Chi Library is selling 1994 CPTs and ICDs

The Med Chi Library is now selling the most popular formats of the two coding products that detail the codes required by insurance companies. The *CPT 94* is available in the traditional softbound version, including self-adhesive page tabs and a clinical examples supplement. This year's *CPT* reflects over 790 additions, revisions, and deletions. The library also stocks the *ICD-9-CM 1994* office edition published by PMIC, with volumes 1 and 2 bound in one book in the same convenient size as the *CPT*. The PMIC version features color coding, thumb indexing, and flags denoting fifth digits needed.

The cost for the *CPT* is $36.00 ($38.00 if shipped). The cost for the *ICD* is $40.00 ($45.00 if shipped). To order, please send a check or money order made payable to the Med Chi Library, to Rosalind Ellen, 1211 Cathedral Street, Baltimore, MD 21201. Orders must be prepaid and will generally be filled within 48 hours.

Physician Rehabilitation Committee is holding its Fourth Annual Conference on Addiction

The Fourth Annual Conference on Addiction is being held Saturday, December 11, 1993, at the Sheraton International Hotel BWI Airport from 7:30 a.m. to 6:00 p.m. Topics will include the biomedical aspects of addiction, nicotine addiction, the nature and present status of drug abuse treatment, the need for greater access to treatment, the future of drug control policy in America, helping the helpers, and heroin and other opiods; use and abuse.

Registration fees are: $60 - Med Chi member, $100 - nonmember physician/Ph.D., $40 - allied health professionals, and no charge for medical students or medical residents. (Fee includes buffet lunch.) For additional information, or to register, see page 1032 of this issue of the *Maryland Medical Journal*, or call (410) 962-5580 or 1-800-992-7010.

1993-1994 Med Chi Directory coming in November

The *1993-1994 Med Chi Directory* will be mailed to members with the November issue of the *Maryland Medical Journal*. Nonmembers may purchase a copy for $250. Please contact Wanda Griebel at (410)539-0872 or 1-800-492-1056.

Member Address Changes Must Be Directed to Membership Department

Please note that notifying a committee staffperson of an address change for the purpose of your committee correspondence does not correct your address in the Med Chi membership database. If your address changes, please notify Wanda Griebel in the Membership Department at (410)539-0872 or 1-800-492-1056.

Med Chi Auxiliary donates computer to the Heartly House

Georgia Lizas, president of the Med Chi Auxiliary; Barbara Foris, president of the Auxiliary to the Frederick County Medical Society; and Ching Barretto, the Harford County State Health Projects chairperson, recently presented a computer to Sue Hecht, executive director of the Heartly House in Frederick County. The Heartly House provides shelter services; housing, job, and medical community referrals; crisis intervention; and legal services.

Physicians Needed for Doctor of the Day Program

Med Chi needs physicians to volunteer to be a "Doctor of the Day." When the Maryland General Assembly convenes in Annapolis for its 1994 session, Med Chi will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state

capitol building, see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs.

Medicare Medical Policies

Beginning on page 1037 of this issue of the journal, there are three Medicare medical policies. Please review these policies on plastic surgery, erythropoietin/EPO/Epoetin alfa/PROCRIT/epogen, and mammography, and detach them for your records.

President's letters

Directly following this *Chief Executive Officer's Newsletter* are two president's letters. The first letter highlights the Physicians' Campaign Against Family Violence, an initiative being sponsored by the Maryland Alliance Against Family Violence. Following Dr. Snyder's letter, Joanne Tulonen, executive director of the alliance, provides details on Med Chi's involvement in this important educational endeavor.

The second president's letter summarizes the discussions on health system reform at two recent AMA-sponsored meetings. Subsequent pages include a Med Chi statement on the Clinton Health Security Act and information on how the Clinton Health Plan will affect the Maryland Health Care and Insurance Reform Act of 1993 (HB 1359).

Carrier Advisory Committee meetings

Members of the Carrier Advisory Committee are encouraged to attend the next meeting of the committee on December 15, 1993.

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

Medical
and Chirurgical Faculty
of Maryland

President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to members

Dear Colleague:

The cover of this month's *Maryland Medical Journal* highlights the Physicians' Campaign Against Family Violence, which is an educational program that will focus on the vital role physicians can play in breaking the cycle of family violence through the physician/patient relationship. The program will target three areas of family violence: domestic violence—also known as spouse or partner abuse—child abuse, and elder abuse.

Family violence cuts across all social and economic classes, races, and age groups. As president of Med Chi, I am proud to join with the Maryland Alliance Against Family Violence in this exciting new initiative.

The theme of this campaign is "Unlock the silence. Trust is the key." The goal of the program is to unlock the silence that frequently surrounds family violence by educating physicians about the prevalence of family violence and helping them identify, diagnose, intervene with, and refer victims. Promulgating legislation that will make it easier for victims and physicians to report abuse will also be addressed.

The physicians' campaign is not a solo endeavor but the joint effort of over 20 state and health organizations. This collaborative effort includes physicians, nurses, social workers, educators, academicians, experts, lawyers, auxilians, and other interested individuals.

In the months to come, Med Chi will be apprising you of the progress of the campaign and notifying you about educational opportunities. Help Med Chi take the lead in alleviating and eradicating family violence by being an active participant in the physicians' campaign. Together we can make a difference in the health and well-being of our patients.

Sincerely,

Joseph Snyder, M.D.
President

Med Chi launches a major family violence prevention initiative

Joanne Tulonen

Ms. Tulonen is executive director of the Maryland Alliance Against Family Violence.

In September, the Medical and Chirurgical Faculty of Maryland (Med Chi) and the Maryland Alliance Against Family Violence launched a major family violence prevention initiative in Maryland. A joint task force on family violence was formed under the auspices of Med Chi's Public Health and Public Relations committees in recognition of the fact that the Maryland medical community needed a coordinated response to the increasing awareness of family violence as a public health issue.

The Family Violence Task Force provides an opportunity to develop materials for physicians, launch a statewide training program, and effectively implement protocols recommended by the American Medical Association (AMA) and mandates issued by the Joint Commission on the Accreditation of Healthcare Organizations (JCAHO). The task force is cochaired by Martin P. Wasserman, M.D., and Hiroshi Nakazawa, M.D. Med Chi has donated $25,000 in start-up funds for the Maryland Physicians' Campaign Against Family Violence, which will be directed by the task force. The campaign's theme is "Unlock the silence: Trust is the key."

The problem

Each year, an estimated 20 to 25 million Americans are directly affected by family violence as victims, witnesses, or perpetrators. Secondary victims are all of us who pay the tremendous social costs in terms of suicides, divorces, teen pregnancy, and crime, as well as the enormous economic expenditures that family violence costs the health care system, businesses, the legal system, social services, the courts, prisons, and drug and alcohol programs.

Every day across the state of Maryland, thousands of family violence victims present themselves to physicians for care. These victims appear at hospitals, clinics, and physicians' offices with broken bodies and broken spirits. Due to the lack of family violence information and training traditionally offered to physicians and nurses, many patients are unidentified as victims.

In addition to the lack of training, there is another barrier to overcome. It is the silence that surrounds and perpetuates this issue. This silence, caused by a variety of beliefs and fears, contributes to the suffering of victims and to the social and economic costs we all pay. To its credit, Med Chi has decided to end that silence.

Formation of the task force

The 25 members of the Family Violence Task Force represent major Maryland medical and health-related organizations including the Maryland Chapter, the American College of Emergency Physicians; the Maryland Academy of Family Physicians; the Maryland Society of Internal Medicine; the Obstetrical and Gynecological Society of Maryland; the Maryland Chapter, American Academy of Pediatrics; the Maryland Nurses Association; the Maryland Emergency Nurses Association; the Maryland Hospital Association, Maryland Chapter; the National Association of Social Workers, Maryland Chapter; the Society for Hospital Social Work Directors; the University of Maryland School of Medicine; the Johns Hopkins Injury Prevention Center; the Maryland Department of Human Resources and the Department of Health and Mental Hygiene; and advocates from groups concerned with domestic violence, child abuse, and elder abuse.

The task force, convened in September, plans to complete its work in 18 months. Its mission is

to design a campaign to educate physicians about the prevalence of family violence, its impact on the health and well-being of victims, and the necessity of effective intervention by the medical community. The task force will coordinate statewide physician training and investigate the need to review Maryland family violence statutes.

Scope of the campaign

The Maryland Physicians' Campaign Against Family Violence is a statewide effort to increase awareness of family violence as a public health issue and to enlist the medical community's assistance in the elimination of family violence. The campaign has three primary goals. The first is to develop protocol and educational materials on domestic violence, child abuse, and elder abuse. The second goal is to offer educational conferences on family violence to hospital personnel and physicians and to physicians in private practice. The third goal is to conduct a public education campaign.

Developing training protocols and materials. Several states have produced educational materials on family violence. After careful review, it was decided to use the materials developed by the Ohio Medical Association as the basis for Maryland's physician handbooks.

The Maryland handbooks will use AMA-developed protocols and will provide physicians with information on family violence dynamics, assessment tools, legal and ethical requirements of reporting and documenting abuse, and a referral list for each community. Three physician handbooks on each aspect of family violence—domestic violence, child abuse, and elder abuse—will be provided. Handbooks and other promotional materials will be sent to 7,000 physicians statewide, mainly to family practitioners, obstetricians, pediatricians, and emergency physicians. If additional resources become available, materials will be distributed to a wider audience. The first handbook on domestic violence is scheduled for distribution in January 1994.

Physician education. JCAHO has mandated that hospitals provide their medical staff with training on all aspects of family violence. The task force's objective is to provide the training, with the hospitals' assistance, in a coordinated manner. A task force subcommittee will identify and train teams of advocates and physicians from each county who, in turn, will train medical staffs of local hospitals. Training will take place over the next year on each aspect of family violence, beginning with domestic violence.

The second phase of training will be conducted through a series of conferences sponsored by county medical societies and Med Chi. These conferences will be for physicians in private practice who were not able to attend the local hospital training sessions. Task force members hope the conferences will provide county medical societies and auxiliaries and local family violence advocates an opportunity to network and begin to promote family violence as an important public health issue in their local communities.

Educating the public. With any initiative, public education must be a component. To achieve this end, Med Chi and the Maryland Alliance Against Family Violence will conduct a public relations campaign using traditional and nontraditional methods. The theme, "Unlock the silence: Trust is the key," will be used on all public education materials created by the task force.

The task force plans to submit materials for publication consideration to the *Maryland Medical Journal* in the hopes that a special issue on family violence can be published in the spring of 1994. Also, each task force member will be urged to submit an article to their own organization's publication announcing the task force and the Maryland Physicians' Campaign Against Family Violence.

The alliance received a $35,000 federal grant to develop informational materials to promote family violence as a public health issue in the general population. These materials for victims of family violence will be developed in conjunction with the physicians' campaign. The brochure for victims will provide information on family violence and a resource list, and will encourage victims to trust their physicians and turn to them for help.

The Maryland medical community is to be congratulated for taking a stand on family violence, unlocking the silence, and signaling to the rest of the community that family violence is a serious problem affecting the health and well-being of all family members, as well as having an impact on the entire community. ■

Medical and Chirurgical Faculty of Maryland

President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to members

Dear Colleague:

I'm sure that many of you watched President Clinton's speech on September 22 about his proposed Health Security Act. Since then, you have probably seen and heard numerous comments and opinions about it on radio, television, and in the newspaper. There is a great deal of concern among physicians about the plan and what it will mean to patients and the profession. Therefore, I want to inform you of some developments on health system reform that occurred during two recent AMA-sponsored meetings.

On September 29 and 30, I attended the AMA's 1993 Political Education Conference in Washington, DC. This conference gave the medical community an opportunity to discuss various reform proposals with members of the Clinton administration and with Congressional representatives. Conference speakers included Lonnie Bristow, M.D., chairperson, AMA Board of Trustees; James Todd, M.D., AMA executive vice president; Donna Shalala, secretary, Department of Health and Human Services; George Mitchell (D-ME), Senate majority leader; Bob Michel (R-IL); Newt Gingrich (R-GA); Jay Rockefeller (D-WV); and others.

The administration's representatives did not provide much additional insight into the Health Security Act. Ms. Shalala restated some of the plan's major components—health alliances, consumer choice, and malpractice reform. She also said that the plan's tort reform would limit attorneys' fees to one-third of an award. Senator Mitchell talked about the plan's global budget. He said that although the global budget issue will be vigorously debated by Congress, he does not expect the Democratic leadership to change their position on it.

We heard about the Affordable Health Care Now Act of 1993 (HR 3080) from Representative Bob Michel. This bill—one of several alternative reform bills submitted to Congress—was drafted by the House Republican leaders' Health Care Task Force and introduced to Congress on September 16, 1993, by Representative Michel with 105 cosponsors. HR 3080 contains provisions for malpractice reforms, antitrust measures, anti-fraud measures, insurance market reforms, and Medicaid reform. The bill would require employers to offer all employees health insurance coverage; however, it would not require employers to pay any employee premiums.

During the conference, we also discussed the AMA's reform proposal, Health Access America, with various congressional representatives. Through these discussions, we learned that most Republicans oppose the employer mandates proposed in the AMA plan. We also learned that most Republicans are concerned about the new cost of entitlement programs, especially Medicare's prescription drugs benefit and expanded long-term care coverage. They do not think that you can add these new things to the system without adding tremendous cost.

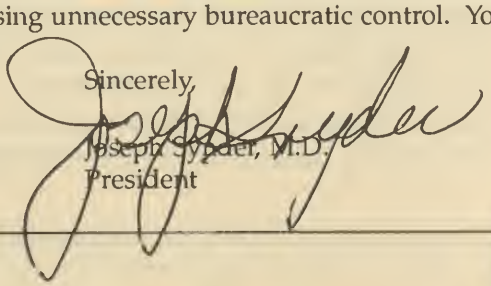
On Saturday, October 2, Med Chi's CEO (Angelo Troisi) and I attended the AMA's Federation Leadership Meeting in Chicago, Illinois. Forty-five states and 17 specialty societies were represented at this meeting, and we shared our concerns regarding the Clinton Health Security Act. Two particular areas of concern—medical education and tort reform—were addressed.

HEALTH SYSTEM REFORM

William Jacott, M.D.,vice chairperson, AMA Board of Trustees, described how the currently proposed Clinton plan will affect medical education. After a five-year transition period, 50% of physicians in residency training must be in primary care. The transition plan requires primary training slots to increase 7% each year, and specialty training slots to decrease 10% each year. The training slots at all medical schools would be allocated by the Department of Health and Human Services based upon recommendations from a new national council on graduate medical education. The plan will also double the number of training positions available for nurse practitioners, nurse midwives, and physicians' assistants. Dr. Jacott stated that the plan would federalize the nation's medical education system. The AMA opposes arbitrary quotas restricting individuals' free choice to pursue their chosen fields.

Frank B. Walker, M.D., member of the AMA's Board of Trustees and the board's Executive Committee, spoke about tort reform. The currently proposed Clinton plan requires patients to submit malpractice claims through an alternative dispute resolution (ADR) system. Suits must include a certificate of merit affidavit that is signed by a medical specialist and states that the care received deviated from established standards. The plan also includes a collateral source rule, a provision for periodic payments, and a cap on attorneys' fees. Most of these elements are already present in Maryland, although the cap on noneconomic damages for wrongful death was overturned recently. In response to the Clinton plan, the AMA is proposing a $250,000 limit on noneconomic damages and more stringent limits on attorneys' fees.

By now, you should have received the AMA's analysis of the Clinton plan, which was sent to every physician in the country. I urge you to look at it and become familiar with the different aspects of this plan. You need to understand the plan so that you can answer your patients' questions about it and become actively involved in shaping the future of health care in America.



During the upcoming debate on the numerous issues surrounding health system reform, the AMA will be organized medicine's principal voice in Washington. The AMA will continue to analyze various reform plans, testify before congressional and executive branch committees, and provide extensive input to Congress and the administration on specific reform approaches. If you are not already an AMA member, I urge you to support organized medicine by joining today.

Med Chi will be your principal voice in Maryland and will continue working with state legislators to develop meaningful reform on both the state and federal level. Your Med Chi leadership will be going to the component societies and the president's regional meetings to discuss health system reform. Please use these opportunities to let Med Chi know your concerns and questions. The date for the next regional meeting is:

President's Western Regional Conference
Thursday, November 11, 1993, 4:30 p.m., Sheraton Inn, Hagerstown, Maryland

The next few months will be a critical time for physicians. This is a time to stay united. The future of the profession and of patients' security can only be maintained if all physicians stand together. Med Chi and the AMA want to send Congress a message that they are speaking for the physicians in the country who want workable health system reform that does not jeopardize patient care by imposing unnecessary bureaucratic control. Your support in this endeavor is needed.

Sincerely,

Joseph Snyder, M.D.
President

Statement from the Medical and Chirurgical Faculty of Maryland on the Clinton Health Security Act

The Medical and Chirurgical Faculty of Maryland (Med Chi) believes that the American health care system must be reformed to expand access, contain cost, and maintain quality. However, we believe that all reform measures must put the patient and the quality of care first while maintaining the security of the physician-patient relationship.

We applaud the President and Mrs. Clinton for their sincere efforts to establish a health care system that provides universal access and a comprehensive standard benefits package for all Americans. We support the plan's provisions that provide the necessary insurance reforms to guarantee that individuals can maintain their insurance despite changes in employment or health status. We are also encouraged that the plan recognizes the need for liability reform by including an alternative dispute resolution system, a collateral source rule, and caps on attorneys' fees.

President Clinton's proposed health system reform plan based on security, coverage, simplicity, savings, choice, quality, and responsibility is an ambitious blueprint for overhauling the American health care system. However, if the plan were to pass as currently proposed, patients and their physicians could face some serious problems.

One of our major concerns is that elements of this plan seem to create a barrier between physicians and patients. The strength of our current health care system relies upon allowing treatment choices to be based on the best interest of each individual patient. Global budgets, premium caps, and the plan's emphasis on cost savings could place undue restrictions on a physician's ability to make appropriate clinical decisions. We believe that the quality of health care will suffer if physicians are transformed from patient advocates to simple dispensers of services that are mandated by tightly controlled insurance plans and federal and state regulatory boards.

The Clinton plan proposes a seven-member, presidentially appointed National Health Board that would have broad regulatory control over state health alliances and plans and enforce global budgets for health care spending. These global budgets would be based solely on the Consumer Price Index rather than on changing demographics and health care needs across the population. Physicians believe that price indexes cannot adequately predict health care costs and that there is a desperate need to look at societal issues—drug abuse, crack babies, smoking, alcoholism—and their impact on the cost and delivery of health care. Otherwise, health system reform could create an arbitrary maldistribution of health services and prevent patients from receiving appropriate health care.

We are also concerned about the control the federal government will be exercising over the supply of physicians under the President's proposal. By mandating that medical schools train 50% of their students in primary care and by allocating residency slots through new national and regional graduate medical education councils, the federal government essentially will nationalize medical education in this country. We believe that the incentives to practice primary care included in the President's plan along with changes in the health care marketplace may be sufficient to encourage medical students to pursue careers in primary medicine. These incentives should be given an opportunity to work.

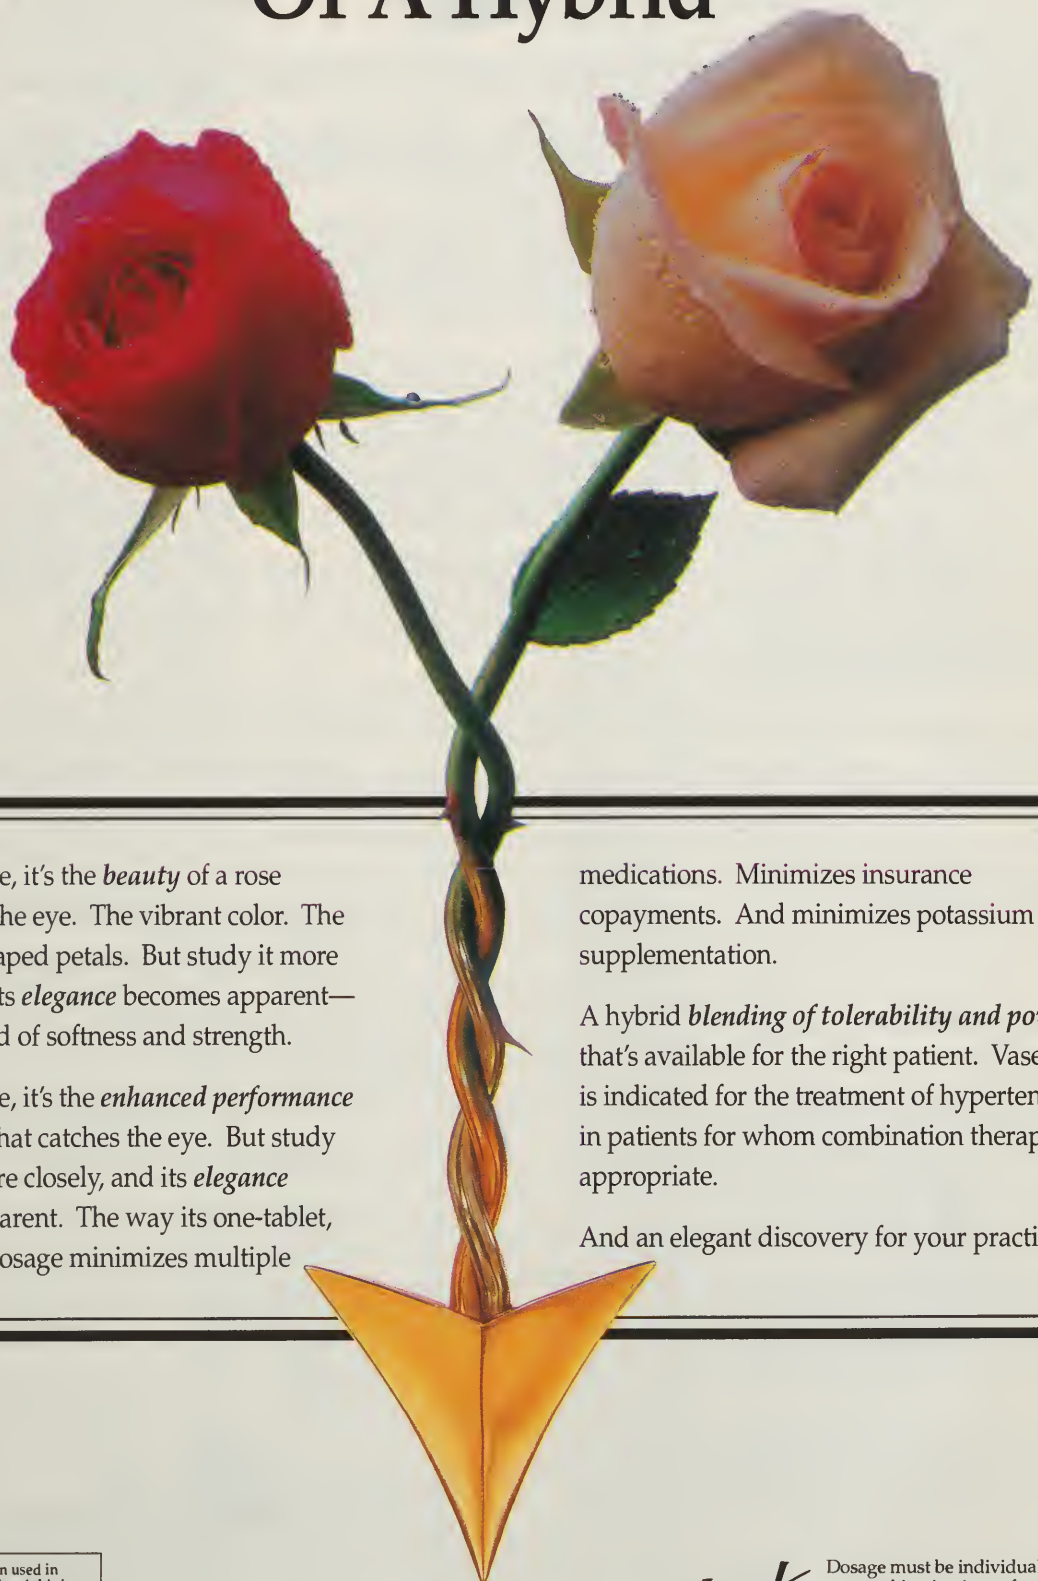
The President stated that his plan will provide more choices for physicians; however, we are concerned because the President did not define these choices. The President's employer mandates could actually limit physicians' choices by forcing them out of private practice and into managed care plans.

The President promised to "preserve what is right" with the existing system. The current system provides excellent health care to the majority of Americans; this quality care is "right" and must be preserved. However, the technology necessary to provide high quality care frequently carries a high price tag that escalates as technology advances. The President's plan does not address how it will control costs, yet still make this essential technology accessible to physicians and patients.

Finally, we are deeply concerned about how the President's proposal will be financed. The plan's reliance on deep spending cuts in Medicaid and Medicare could threaten future medical services for the poor and elderly. And, because the proposed plan increases bureaucracy at the federal, state, and corporate level, administrative costs of health care are likely to increase rather than decrease. Physicians and our patients want to know how this plan will be paid for.

Med Chi understands that the President's plan is subject to revision. We welcome the opportunity to work with state and federal legislators in shaping the future of health care and developing a plan that protects all patients' freedom to choose their own doctors and have a voice in their medical care.

How will the Clinton Health Plan affect the Maryland Health Care and Insurance Reform Act of 1993 (HB 1359)?



As passed in April of this year, the Maryland Health Care and Insurance Reform Act establishes the Maryland Health Care Access and Cost Commission (HCACC), which will oversee the development and implementation of HB 1359. The act includes legislation on (1) the Small Employer Health Benefit Program that requires all insurers to offer at least the Comprehensive Standard Health Benefit Plan to employers with 2 to 50 employees; (2) the establishment of a 15-member advisory committee to develop practice parameters as requested by HCACC; (3) a payment system applicable to health care providers; (4) a medical care database that will collect data on health services provided by health care practitioners; and (5) a procedure that regulates how physicians can charge for diagnostic tests.

The Clinton plan, as currently proposed, addresses health system reform on a much larger scale than the Maryland act by, among other things, extending a guaranteed benefits package to every American citizen and legal resident; requiring each state to create health care alliances; establishing a presidentally appointed National Health Board that would oversee the new health system, set a national health budget ceiling, and set spending targets for each state and health care alliances; capping attorneys' fees; providing for an alternative dispute resolution system; establishing a collateral source rule; and revamping medical education to provide more primary care physicians.

There are some areas of overlap between the Clinton plan and the Maryland act, including the requirement for all insurers to offer a standard benefits package; the requirement for statewide data collection; the creation of practice parameters; and the use of government-appointed boards to oversee cost-containment strategies. Both the Maryland act and the proposed Clinton plan prohibit insurers from denying insurance based on pre-existing conditions, establish insurance fees based on community rating, and make insurance coverage "portable."

Although there has been some indication from the Clinton administration that states could continue to operate their own plans, state officials, legislators and health care experts currently believe that Maryland will have to change its plan to comply with the federal plan if it is passed by Congress in its present form. For example, Maryland's standard benefits package would have to conform to the federal guaranteed benefits package. Practice parameters established by the state would have to comply with federally established practice parameters; however, community standards of care will **not** be superseded by federal standards of care. Finally, the payment system established by the Maryland act, which normally allows health care providers who receive less than a full fee from a health insurer to bill a patient for the balance, would be overridden by the regional or state-established fee structure system in the Clinton plan, which prohibits balance billing.

Discover The Elegance Of A Hybrid

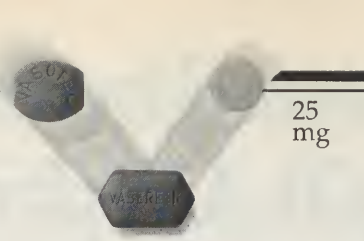
At first glance, it's the ***beauty*** of a rose that catches the eye. The vibrant color. The delicately shaped petals. But study it more closely, and its ***elegance*** becomes apparent—a gentle blend of softness and strength.

At first glance, it's the ***enhanced performance*** of Vaseretic that catches the eye. But study Vaseretic more closely, and its ***elegance*** becomes apparent. The way its one-tablet, once-a-day dosage minimizes multiple medications. Minimizes insurance copayments. And minimizes potassium supplementation.

A hybrid ***blending of tolerability and power*** that's available for the right patient. Vaseretic is indicated for the treatment of hypertension in patients for whom combination therapy is appropriate.

And an elegant discovery for your practice.

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, Vaseretic® (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*



VASERETIC® 10-25 *Next*
Enalapril Maleate-Hydrochlorothiazide

Dosage must be individualized; the fixed combination is not for initial therapy.

Evaluation of the hypertensive patient should always include assessment of renal function.

For a Brief Summary of Prescribing Information, see adjacent pages.

(ENALAPRIL MALEATE-HYDROCHLOROTHIAZIDE)

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*

CONTRAINDICATIONS: VASERETIC is contraindicated in patients who are hypersensitive to any component of this product and in patients with a history of angioedema related to previous treatment with an angiotensin converting enzyme inhibitor. Because of the hydrochlorothiazide component, this product is contraindicated in patients with anuria or hypersensitivity to other sulfonamide-derived drugs.

WARNINGS: *General; Enalapril Maleate; Hypotension:* Excessive hypotension was rarely seen in uncomplicated hypertensive patients but is a possible consequence of enalapril use in severely salt/volume depleted persons such as those treated vigorously with diuretics or patients on dialysis.

Syncope has been reported in 1.3 percent of patients receiving VASERETIC. In patients receiving enalapril alone, the incidence of syncope is 0.5 percent. The overall incidence of syncope may be reduced by proper titration of the individual components. (See PRECAUTIONS, *Drug Interactions,* and ADVERSE REACTIONS.)

In patients with severe congestive heart failure, with or without associated renal insufficiency, excessive hypotension has been observed and may be associated with oliguria and/or progressive azotemia, and rarely with acute renal failure and/or death. Because of the potential fall in blood pressure in these patients, therapy should be started under very close medical supervision. Such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart or cerebrovascular disease, in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident.

If hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses, which usually can be given without difficulty once the blood pressure has increased after volume expansion.

Angioedema: Angioedema of the face, extremities, lips, tongue, glottis and/or larynx has been reported in patients treated with angiotensin converting enzyme inhibitors, including enalapril. In such cases VASERETIC should be promptly discontinued and appropriate therapy and monitoring should be provided until complete and sustained resolution of signs and symptoms has occurred. In instances where swelling has been confined to the face and lips the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis or larynx, likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL) and/or measures necessary to ensure a patent airway, should be promptly provided.** (See ADVERSE REACTIONS.)

Patients with a history of angioedema unrelated to ACE inhibitor therapy may be at increased risk of angioedema while receiving an ACE inhibitor (see also CONTRAINDICATIONS).

Neutropenia/Agranulocytosis: Another angiotensin converting enzyme inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Hydrochlorothiazide: Thiazides should be used with caution in severe renal disease. In patients with renal disease, thiazides may precipitate azotemia. Cumulative effects of the drug may develop in patients with impaired renal function.

Thiazides should be used with caution in patients with impaired hepatic function or progressive liver disease, since minor alterations of fluid and electrolyte balance may precipitate hepatic coma.

Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma.

The possibility of exacerbation or activation of systemic lupus erythematosus has been reported.

Lithium generally should not be given with thiazides (see PRECAUTIONS, *Drug Interactions, Enalapril Maleate and Hydrochlorothiazide).*

Pregnancy; Enalapril-Hydrochlorothiazide: There was no teratogenicity in rats given up to 90 mg/kg/day of enalapril (150 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose) or in mice given up to 30 mg/kg/day of enalapril (50 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose). At these doses, fetotoxicity expressed as a decrease in average fetal weight occurred in both species. No fetotoxicity occurred at lower doses; 30/10 mg/kg/day of enalapril-hydrochlorothiazide in rats and 10/10 mg/kg/day of enalapril-hydrochlorothiazide in mice.

When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC should be discontinued as soon as possible. (See *Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality,* below.)

Enalapril Maleate; Fetal/Neonatal Morbidity and Mortality: ACE inhibitors can cause fetal and neonatal morbidity and death when administered to pregnant women. Several dozen cases have been reported in the world literature. When pregnancy is detected, ACE inhibitors should be discontinued as soon as possible.

The use of ACE inhibitors during the second and third trimesters of pregnancy has been associated with fetal and neonatal injury, including hypotension, neonatal skull hypoplasia, anuria, reversible or irreversible renal failure, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function; oligohydramnios in this setting has been associated with fetal limb contractures, craniofacial deformation, and hypoplastic lung development. Prematurity, intrauterine growth retardation, and patent ductus arteriosus have also been reported, although it is not clear whether these occurrences were due to the ACE-inhibitor exposure.

These adverse effects do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. Mothers whose embryos and fetuses are exposed to ACE inhibitors only during the first trimester should be so informed. Nonetheless, when patients become pregnant, physicians should make every effort to discontinue the use of VASERETIC as soon as possible.

Rarely (probably less often than once in every thousand pregnancies), no alternative to ACE inhibitors will be found. In these rare cases, the mothers should be apprised of the potential hazards to their fetuses, and serial ultrasound examinations should be performed to assess the intraamniotic environment.

If oligohydramnios is observed, VASERETIC should be discontinued unless it is considered lifesaving for the mother. Contraction stress testing (CST), a non-stress test (NST), or biophysical profiling (BPP) may be appropriate, depending upon the week of pregnancy. Patients and physicians should be aware, however, that oligohydramnios may not appear until after the fetus has sustained irreversible injury.

Infants with histories of *in utero* exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Exchange transfusion or dialysis may be required as means of reversing hypotension and/or substituting for disordered renal function. Enalapril, which crosses the placenta, has been removed from neonatal circulation by peritoneal dialysis with some clinical benefit, and theoretically may be removed by exchange transfusion, although there is no experience with the latter procedure.

No teratogenic effects of enalapril were seen in studies of pregnant rats, and rabbits. On a mg/kg basis, the doses used were up to 333 times (in rats), and 50 times (in rabbits) the maximum recommended human dose.

Hydrochlorothiazide; Teratogenic Effects: Reproduction studies in the rabbit, the mouse and the rat at doses up to 100 mg/kg/day (50 times the human dose) showed no evidence of external abnormalities of the fetus due to hydrochlorothiazide. Hydrochlorothiazide given in a two-litter study in rats at doses of 4 - 5. 6 mg/kg/day (approximately 1 - 2 times the usual daily human dose) did not impair fertility or produce birth abnormalities in the offspring. Thiazides cross the placental barrier and appear in cord blood.

Nonteratogenic Effects: These may include fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult.

PRECAUTIONS: *General; Enalapril Maleate; Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe congestive heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with angiotensin converting enzyme inhibitors, including enalapril, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20 percent of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent pre-existing renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when enalapril has been given concomitantly with a diuretic. This is more likely to occur in patients with pre-existing renal impairment. Dosage reduction of enalapril and/or discontinuation of the diuretic may be required.

Evaluation of the hypertensive patient should always include assessment of renal function.

Hemodialysis Patients: Anaphylactoid reactions have been reported in patients dialyzed with high-flux membranes (e.g., AN 69*) and treated concomitantly with an ACE inhibitor. In these patients consideration should be given to using a different type of dialysis membrane or a different class of antihypertensive agent.

Hyperkalemia: Elevated serum potassium (greater than 5.7 mEq/L) was observed in approximately one percent of hypertensive patients in clinical trials treated with enalapril alone. In most cases these were isolated values which resolved despite continued therapy, although hyperkalemia was a cause of discontinuation of therapy in 0.28 percent of hypertensive patients. Hyperkalemia was less frequent (approximately 0.1 percent) in patients treated with enalapril plus hydrochlorothiazide. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with enalapril. (See *Drug Interactions.)*

Cough: Cough has been reported with the use of ACE inhibitors. Characteristically, the cough is nonproductive, persistent and resolves after discontinuation of therapy. ACE inhibitor-induced cough should be considered as part of the differential diagnosis of cough.

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Hydrochlorothiazide: Periodic determination of serum electrolytes to detect possible electrolyte imbalance should be performed at appropriate intervals. All patients receiving thiazide therapy should be observed for clinical signs of fluid or electrolyte imbalance: hyponatremia, hypochloremic alkalosis, and hypokalemia. Serum and urine electrolyte determinations are particularly important when the patient is vomiting excessively or receiving parenteral fluids. Warning signs or symptoms of fluid and electrolyte imbalance, irrespective of cause, include dryness of mouth, thirst, weakness, lethargy, drowsiness, restlessness, confusion, seizures, muscle pains or cramps, muscular fatigue, hypotension, oliguria, tachycardia, and gastrointestinal disturbances such as nausea and vomiting.

Hypokalemia may develop, especially with brisk diuresis, when severe cirrhosis is present, or after prolonged therapy. Interference with adequate oral electrolyte intake will also contribute to hypokalemia. Hypokalemia may cause cardiac arrhythmia and may also sensitize or exaggerate the response of the heart to the toxic effects of digitalis (e.g., increased ventricular irritability). Because enalapril reduces the production of aldosterone, concomitant therapy with enalapril attenuates the diuretic-induced potassium loss (see *Drug Interactions, Agents Increasing Serum Potassium).*

Although any chloride deficit is generally mild and usually does not require specific treatment except under extraordinary circumstances (as in liver disease or renal disease), chloride replacement may be required in the treatment of metabolic alkalosis.

Dilutional hyponatremia may occur in edematous patients in hot weather; appropriate therapy is water restriction, rather than administration of salt except in rare instances when the hyponatremia is life-threatening. In actual salt depletion, appropriate replacement is the therapy of choice.

Hyperuricemia may occur or frank gout may be precipitated in certain patients receiving thiazide therapy.

In diabetic patients dosage adjustments of insulin or oral hypoglycemic agents may be required. Hyperglycemia may occur with thiazide diuretics. Thus latent diabetes mellitus may become manifest during thiazide therapy.

The antihypertensive effects of the drug may be enhanced in the postsympathectomy patient.

If progressive renal impairment becomes evident consider withholding or discontinuing diuretic therapy.

Thiazides have been shown to increase the urinary excretion of magnesium; this may result in hypomagnesemia.

Thiazides may decrease urinary calcium excretion. Thiazides may cause intermittent and slight elevation of serum calcium in the absence of known disorders of calcium metabolism. Marked hypercalcemia may be evidence of hidden hyperparathyroidism. Thiazides should be discontinued before carrying out tests for parathyroid function.

Increases in cholesterol and triglyceride levels may be associated with thiazide diuretic therapy.

Information for Patients; Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

Pregnancy: Female patients of childbearing age should be told about the consequences of second- and third-trimester exposure to ACE inhibitors, and they should also be told that these consequences do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. These patients should be asked to report pregnancies to their physicians as soon as possible.

NOTE: As with many other drugs, certain advice to patients being treated with VASERETIC is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions; Enalapril Maleate; Hypotension—Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted, may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS.)

Agents Causing Renin Release: The antihypertensive effect of enalapril is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: Enalapril has been used concomitantly with beta adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine and prazosin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: Enalapril attenuates diuretic-induced potassium loss. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia they should be used with caution and with frequent monitoring of serum potassium.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant enalapril and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Hydrochlorothiazide; When administered concurrently the following drugs may interact with thiazide diuretics:

Alcohol, barbiturates, or narcotics—potentiation of orthostatic hypotension may occur.

Antidiabetic drugs (oral agents and insulin)—dosage adjustment of the antidiabetic drug may be required.

Other antihypertensive drugs—additive effect or potentiation.

Cholestyramine and colestipol resins—Absorption of hydrochlorothiazide is impaired in the presence of anionic exchange resins. Single doses of either cholestyramine or colestipol resins bind the hydrochlorothiazide and reduce its absorption from the gastrointestinal tract by up to 85 and 43 percent, respectively.

Corticosteroids, ACTH—intensified electrolyte depletion, particularly hypokalemia.

Pressor amines (e.g., norepinephrine)—possible decreased response to pressor amines but not sufficient to preclude their use.

Skeletal muscle relaxants, nondepolarizing (e.g., tubocurarine)—possible increased responsiveness to the muscle relaxant.

Lithium—should not generally be given with diuretics. Diuretic agents reduce the renal clearance of lithium and add a high risk of lithium toxicity. Refer to the package insert for lithium preparations before use of such preparations with VASERETIC.

Non-steroidal Anti-inflammatory Drugs—In some patients, the administration of a non-steroidal anti-inflammatory agent can reduce the diuretic, natriuretic, and antihypertensive effects of loop, potassium-sparing and thiazide diuretics. Therefore, when VASERETIC and non-steroidal anti-inflammatory agents are used concomitantly, the patient should be observed closely to determine if the desired effect of the diuretic is obtained.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Enalapril in combination with hydrochlorothiazide was not mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril-hydrochlorothiazide did not produce DNA single strand breaks in an *in vitro* alkaline elution assay in rat hepatocytes or chromosomal aberrations in an *in vivo* mouse

Investment Counsel Group

hone marrow assay.

Enalapril Maleate: There was no evidence of a tumorigenic effect when enalapril was administered for 106 weeks to rats at doses up to 90 mg/kg/day (150 times* the maximum daily human dose). Enalapril has also been administered for 94 weeks to male and female mice at doses up to 90 and 180 mg/kg/day, respectively, (150 and 300 times* the maximum daily dose for humans) and showed no evidence of carcinogenicity.

Neither enalapril maleate nor the active diacid was mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril was also negative in the following genotoxicity studies: rec-assay, reverse mutation assay with *E. coli*, sister chromatid exchange with cultured mammalian cells, and the micronucleus test with mice, as well as in an *in vivo* cytogenic study using mouse bone marrow.

There were no adverse effects on reproductive performance in male and female rats treated with 10 to 90 mg/kg/day of enalapril.

Hydrochlorothiazide: Two-year feeding studies in mice and rats conducted under the auspices of the National Toxicology Program (NTP) uncovered no evidence of a carcinogenic potential of hydrochlorothiazide in female mice (at doses of up to approximately 600 mg/kg/day) or in male and female rats (at doses of up to approximately 100 mg/kg/day). The NTP, however, found equivocal evidence for hepatocarcinogenicity in male mice.

Hydrochlorothiazide was not genotoxic *in vitro* in the Ames mutagenicity assay of *Salmonella typhimurium* strains TA 98, TA 100, TA 1535, TA 1537, and TA 1538 and in the Chinese Hamster Ovary (CHO) test for chromosomal aberrations, or *in vivo* in assays using mouse germinal cell chromosomes, Chinese hamster bone marrow chromosomes, and the *Drosophila* sex-linked recessive lethal trait gene. Positive test results were obtained only in the *in vitro* CHO Sister Chromatid Exchange (clastogenicity) and in the Mouse Lymphoma Cell (mutagenicity) assays, using concentrations of hydrochlorothiazide from 43 to 1300 µg/mL, and in the *Aspergillus nidulans* non-disjunction assay at an unspecified concentration.

Hydrochlorothiazide had no adverse effects on the fertility of mice and rats of either sex in studies wherein these species were exposed, via their diet, to doses of up to 100 and 4 mg/kg, respectively, prior to conception and throughout gestation.

Pregnancy, Pregnancy Categories C (first trimester) *and D* (second and third trimesters). See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Nursing Mothers: Enalapril and enalaprilat are detected in human milk in trace amounts. Thiazides do appear in human milk. Because of the potential for serious reactions in nursing infants from either drug, a decision should he made whether to discontinue nursing or to discontinue VASERETIC, taking into account the importance of the drug to the mother.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS: VASERETIC has been evaluated for safety in more than 1500 patients, including over 300 patients treated for one year or more. In clinical trials with VASERETIC no adverse experiences peculiar to this combination drug have heen observed. Adverse experiences that have occurred, have been limited to those that have been previously reported with enalapril or hydrochlorothiazide.

The most frequent clinical adverse experiences in controlled trials were: dizziness (8.6 percent), headache (5.5 percent), fatigue (3.9 percent) and cough (3.5 percent). Adverse experiences occurring in greater than two percent of patients treated with VASERETIC in controlled clinical trials were: muscle cramps (2.7 percent), nausea (2.5 percent), asthenia (2.4 percent), orthostatic effects (2.3 percent), impotence (2.2 percent), and diarrhea (2.1 percent).

Clinical adverse experiences occurring in 0.5 to 2.0 percent of patients in controlled trials included: *Body As A Whole:* Syncope, chest pain, abdominal pain; *Cardiovascular:* Orthostatic hypotension, palpitation, tachycardia; *Digestive:* Vomiting, dyspepsia, constipation, flatulence, dry mouth; *Nervous/Psychiatric:* Insomnia, nervousness, paresthesia, somnolence, vertigo; *Skin:* Pruritus, rash; *Other:* Dyspnea, gout, back pain, arthralgia, diaphoresis, decreased libido, tinnitus, urinary tract infection.

Angioedema: Angioedema has been reported in patients receiving VASERETIC (0.6 percent). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis and/or larynx occurs, treatment with VASERETIC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In clinical trials, adverse effects relating to hypotension occurred as follows: hypotension (0.9 percent), orthostatic hypotension (1.5 percent), other orthostatic effects (2.3 percent). In addition syncope occurred in 1.3 percent of patients. (See WARNINGS.)

Cough: See PRECAUTIONS, *Cough.*

Clinical Laboratory Test Findings, Serum Electrolytes: See PRECAUTIONS.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials minor increases in hlood urea nitrogen and serum creatinine, reversihle upon discontinuation of therapy, were observed in about 0.6 percent of patients with essential hypertension treated with VASERETIC. More marked increases have been reported in other enalapril experience. Increases are more likely to occur in patients with renal artery stenosis. (See PRECAUTIONS.)

Serum Uric Acid, Glucose, Magnesium, and Calcium: See PRECAUTIONS.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g percent and 1.0 vol percent, respectively) occur frequently in hypertensive patients treated with VASERETIC hut are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1 percent of patients discontinued therapy due to anemia.

Liver Function Tests: Rarely, elevations of liver enzymes and/or serum bilirubin have occurred.

Other adverse reactions that have been reported with the individual components are listed below and, within each category, are in order of decreasing severity.

Enalapril Maleate—Enalapril has heen evaluated for safety in more than 10,000 patients. In clinical trials adverse reactions which occurred with enalapril were also seen with VASERETIC. However, since enalapril has been marketed, the following adverse reactions have been reported: *Body As A Whole:* Anaphylactoid reactions (see PRECAUTIONS, *Hemodialysis Patients*); *Cardiovascular:* Cardiac arrest; myocardial infarction or cerehrovascular accident, possibly secondary to excessive hypotension in high risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances including atrial tachycardia and bradycardia; atrial fihrillation; hypotension; angina pectoris; *Digestive:* Ileus, pancreatitis, hepatic failure, hepatitis (hepatocellular [proven on rechallenge] or cholestatic jaundice), melena, anorexia, glossitis, stomatitis, dry mouth; *Hematologic:* Rare cases of neutropenia, thrombocytopenia and bone marrow depression. Hemolytic anemia, including cases of hemolysis in patients with G-6-PD deficiency, has been reported; a causal relationship to enalapril has not been established. *Nervous System/Psychiatric:* Depression, confusion, ataxia, peripheral neuropathy (e.g., paresthesia, dysesthesia); *Urogenital:* Renal failure, oliguria, renal dysfunction (see PRECAUTIONS), flank pain, gynecomastia; *Respiratory:* Pulmonary infiltrates, bronchospasm, pneumonia, bronchitis, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection; *Skin:* Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pemphigus, alopecia, flushing, photosensitivity; *Special Senses:* Blurred vision, taste alteration, anosmia, conjunctivitis, dry eyes, tearing.

Miscellaneous: A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgia/arthritis, myalgia/myositis, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash and other dermatologic manifestations.

Fetal/Neonatal Morbidity and Mortality: See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Hydrochlorothiazide—Body as a Whole: Weakness; *Digestive:* Pancreatitis, jaundice (intrahepatic cholestatic jaundice), sialadenitis, cramping, gastric irritation, anorexia; *Hematologic:* Aplastic anemia, agranulocytosis, leukopenia, hemolytic anemia, thrombocytopenia; *Hypersensitivity:* Purpura, photosensitivity, urticaria, necrotizing angiitis (vasculitis and cutaneous vasculitis), fever, respiratory distress including pneumonitis and pulmonary edema, anaphylactic reactions; *Musculoskeletal:* Muscle spasm; *Nervous System/Psychiatric:* Restlessness; *Renal:* Renal failure, renal dysfunction, interstitial nephritis (see WARNINGS); *Skin:* Erythema multiforme including Stevens-Johnson syndrome, exfoliative dermatitis including toxic epidermal necrolysis, alopecia; *Special Senses:* Transient blurred vision, xanthopsia.

Jurassic Park revisited

This month's *Maryland Medical Journal* contains a testimony for old-fashioned practitioners of medicine (see *Speak Out*, page 974). Doc Pickett and his genre eschew new medical technology and make diagnoses and determine treatment regimens without the benefits of magnetic resonance imaging (MRI), computerized axial tomography (CAT), and designer medications. It has become quite fashionable to bash high-tech diagnostic and therapeutic medical modalities. There are already administrative and financial constraints that limit both physician and patient access to many diagnostic studies and treatments. Much present day mundane medical technology, however, was considered radical during its development and early use, and some defense of new medicine is in order.

My father-in-law died in 1971 at the age of 54 from his third myocardial infarction. Early administration of tissue plasminogen activator or streptokinase during the early hours of his first heart attack or prompt interventional cardiology with angioplasty or coronary bypass would likely have prolonged and improved the quality of his life. Although the expense would have been high, his wife and four children would certainly have been appreciative.

The wife of a minister I know recently had a devastating cerebral hemorrhage from an intracranial arteriovenous malformation. Gamma knives and other microneurosurgical techniques used to ablate such vascular abnormalities without producing extensive neurological deficits are expensive. The patients who benefit from these techniques are grateful, however, that their cerebrovascular accidents are not just considered strokes about which little can be done.

Last year in the United States, more gallbladders were removed laparoscopically than by the conventional avenue of laparotomy. For those patients who had minimal postoperative discomfort and returned to work

Editorial

three to four days postsurgery rather than suffering through abdominal discomfort for a four- to six-week convalescent period after the old conventional procedure, laparoscopic surgery is a wonderful new medical development. Yet just five years ago, laparoscopic cholecystectomy was considered heretical by even enlightened chairpersons of surgery departments at major medical universities. The renal transplant patient whose kidney rejection is prevented by cyclosporin, the ovarian cancer patient whose advanced tumor responds dramatically to Taxol (paclitaxel), the lumbar disc patient whose pain is mercifully relieved by microsurgery after precise diagnosis and definition of the disc herniation by MRI—all of these people are helped tremendously by the new expensive technology and research that many "Doc Picketts" would denounce as ridiculous, newfangled, or useless.

Physicians today probably do rely too much on high technology such as CAT scans or MRI or overutilize expensive technology such as renal dialysis and coronary bypass surgery. The importance of listening carefully to patients' complaints and making sensible, thoughtful assessments of risk/benefit ratios for diagnostic tests and medical therapies cannot be overemphasized. It does not serve medicine well, however, to constantly impugn the development and utilization of high-tech instrumentation and therapeutic modalities in the proper setting. Perhaps we do need some more "dinosaurs" in medicine, but we also need pioneers and rocket scientists.

YOCON®
YOHIMBINE HCl

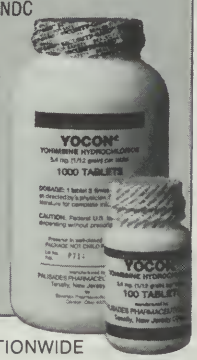
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Serving Baltimore, Washington and Northern Virginia

"People who care for people who need care"

Speak Out

Dinosaurs

My in-laws live in New England—a pair of church-going 90-year olds, still independent in their apartment. Their health is good, but they've had their share of illness along the way.

My wife and I have lived in Maryland for 30 years. It's the same time zone but different area code—too far to intervene emergently and sometimes too close to avoid intense feelings of responsibility. "Maybe we should drive up there this weekend...they sounded so vulnerable today on the phone. They need someone to be there."

Things changed a year ago. Their doctor died. Doc Pickett left this life and left behind a few of his loyal customers. Actually, he was a few years younger than my in-laws. He ended up at home on oxygen, pushing himself to get out a whole paragraph of conversation before pausing to get his wind.

Everyone called him "Doc." He practiced 55 years in one town and took his residency in life experiences. He had been the town public health officer, the football team doctor, a friend and confidant to many, an outspoken (and sometimes annoying) critic of newfangled trends, but always a staunch foe of foolishness.

My wife and I would bite our tongues and roll our eyes when my mother-in-law would tell us of her medical encounters with Doc Pickett. "The Pick," as we called him, apparently relied on outdated medications, and his nondecisions were scary to us at times—at least when we heard my mother-in-law's version of the signs and symptoms. My wife, the nurse, needed restraint at times to keep from calling the Pick and telling him that he should be trying some current pharmaceutical, or he should be sending her parents to the hospital for further evaluation.

Amazingly, the illness or condition always faded or resolved, and my in-laws' unswerving reliance on Doc Pickett never wavered. We could have advised, or driven to their door, or called 911 on many occasions, but they would never have budged without consulting Doc.

A few times in the past five years, they have been too sick to be on their own but not sick enough to be hospitalized. My wife and I drive up, load them into the back seat, and let them recuperate in the balmy climate of

central Maryland. While with us, they consult an internist in Towson and have developed the same sort of trust in his care. They both had pneumonia in 1989, and their belief in his attentive care was just as crucial to their recovery as was his antibiotic. When they recover, they always press for a return trip, refuse to remain in Maryland, disclaim our pointed comments about retirement communities, and off we go back to New England.

Six months before he died, the Pick told his patients to find another physician. We wrote, with my in-laws' permission, and asked that records be forwarded to their "Maryland doctor." The records were a mess, copies of illegible notes and jumbled lab tests—some belonging to other people—no chronologic typewritten histories. We sighed with collective relief that the old folks could now get more appropriate care. They were scheduled to see a young, well-trained internist in New England and could always see someone here in Maryland who medically "spoke our language."

So Doc Pickett died and was publicly appreciated in his hometown as one of a disappearing species. There were some very nice tributes, and we read all the accounts in the newspapers forwarded to us from up north.

Finally, my in-laws were free of the antiquated practices, the old-fashioned thinking, and the low-tech limitations. There were a few months of symptom-free peace and low daughter-anxiety. The in-laws chose a young internist and met briefly with him to review their health concerns. It went well. The breathing in Maryland was easier.

No one was surprised when my mother-in-law (Mary) had a flare-up of her osteoarthritis with neck and back pain. A young chiropractor had advertised her services in the church bulletin, and my mother-in-law went for an initial evaluation—including x-rays and manipulation—all at a "discount." The patient was ambivalent—her neck was a little sore after the visit, but the firm recommendation urged regular visits. The calls to Maryland increased, and the role-reversed advice was to avoid the subluxation business. The chiropractor began to call the home and offer dirt-cheap follow-up treatments, promising relief.

Speak Out

We began to miss Doc Pickett. Why couldn't he have lasted a few more years. My mother-in-law resisted the chiropractic marketing and recovered from the acute pain.

Next came the dizzy spells. Mary had experienced them for years, and they had responded only to time and reassurance from the Pick—plus small doses of meclizine. Now we had entered the modern era. The phone calls usually came after the event by a few days—so the Holter monitor had already been utilized when the symptoms were reported. The new doctor searched but couldn't find the etiology. Mary recovered slowly with time, a little meclizine, and some support but less reassurance than with Doc Pickett. The tests, needless to add, were "covered" by Medicare. I never saw the statements, but the paperwork mounted while the dizziness resolved.

Next it was my father-in-law's turn. Joe's movements had become more restricted, turns were slower, gait more shuffling, and muscles stiffer. During a visit here, his Maryland internist suggested seeing a neurologist, maybe trying some anti-Parkinson's medications. Back to New England and to a neurologist via the new internist. The diagnosis: Parkinson's disease—then a string of medication trials, much of which resulted in severe nausea and slight improvement in mobility.

My wife and I tried to think like Doc Pickett. We countered reports of new medical adventures with words of caution. "Try a smaller dose...call the neurologist...make sure the secretary has him return your call." It was difficult to be so far away. If only the Pick were not extinct. He wouldn't have tried anything fancy. He would weigh the comfort and outcome prospects against the cost of tests and hopes for a cure. Mary and Joe had always trusted his recommendations...without many questions. They trusted his judgment, and it wasn't just because he was a contemporary. He had always done the same for his patients, whether they were twice his age or half his age.

Now we wished for a clone. Why couldn't Doc Pickett have trained one of his children or taken an apprentice. Now that Mary and Joe would have more medical needs, where was the Pick? How had he and his kind disappeared so suddenly? His former patients tended to trust all doctors

Speak Out

because of him, but now they have multiple doctors whose communications are not always so direct, and whose advice is more complex and sometimes at odds with one another's.

Dr. Pickett graduated from medical school in the early 1930s. He must have marveled at hospital ad campaigns and HMO competition and at quarterly statements of medical corporations. Even though he didn't always use the latest available technology, he seemed to understand that a doctor and patient are members of the same community and usually live together over an extended period of time.

If my wife and I survive a few more decades, we'll have to rely on someone's judgment about our health. The living will and durable power of attorney are some solace, but where will we find our Dr. Pickett?

Speak Out is a new *Maryland Medical Journal* department created to enable Med Chi members to voice their opinions, convictions, or feelings about medicine and related subjects in a more lengthy format than is normally afforded by a letter to the editor. Please send *Speak Out* submissions, as well as letters to the editor and manuscripts, to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585.

LETTERS TO THE EDITOR

Does article send the wrong message?

I read the article in the April 1993 journal regarding a Maryland physician trip into the state of Croatia. I am concerned that the article gives the message of supporting the Croatians politically vs the others, especially the Bosnians.

This message is a subliminal message in the form of directing medical attention and care to Croatia and not really the others, especially the nearby Republic of Bosnia, which is suffering much more than Croatia. Also, it states some subjective opinions that Croatia is an advanced country with excellent communications and equipment, etc.

It is my feeling that if anyone deserves help in that area of the world, it should be all who are suffering in the region, regardless whether they belong to Bosnia or Croatia. Knowing what is happening there, obviously the Bosnia Muslims are the ones suffering the most with rape, starvation, and mortar fire.

I felt your article gives the wrong message. I hope you will correct this in future articles or at least put a disclaimer, that this by no means indicates an endorsement of one country against the other. The *Maryland Medical Journal* should be above political bias or religious prejudice.

Needle aspiration cytologic biopsies of breast masses—economical and accurate

I feel compelled to comment on the excellent article by Cynthia Swann, M.D., titled "Breast carcinoma with halo sign" published in the May issue of the journal. Dr. Swann makes a good case to support her final sentence stating "Caution must be used in the evaluation of all solid breast masses, and malignant etiologies must be considered even in the presence of the halo sign."

A criticism is herewith directed, not at Dr. Swann or her article, but at the fact that "Attempted aspiration by the patient's physician did not yield fluid." I presume the mass was palpable, and the physician properly wanted to determine whether it might have been a simple cyst. The very presence of a needle in this mass confirming it was solid rather than cystic provided the perfect opportunity to obtain a fine needle suction aspiration cytologic biopsy. In my view, every palpable suspicious breast mass should undergo needle puncture, not just for fluid aspiration, but, if no fluid is present, an immediate fine needle aspiration biopsy. This is certainly the simplest biopsy technique that I am aware of, and also one of the most accurate. As noted in my article published in the April *MMJ*, needle aspiration cytologic biopsies of breast masses give the most accurate definitive diagnosis possible without open surgical removal. It should be a technique utilized by every physician managing breast disease.

ROBERT E. MARTIN, M.D.
Dr. Martin is a general surgeon in Baltimore, Maryland. ■

Cost-effectiveness questioned

Dr. Martin's letter raises the question: Has a cost-effectiveness assessment of fine needle aspiration biopsy of palpable solid breast masses been conducted? Dr. Martin suggests that for a palpable breast mass, in addition to attempts to aspirate fluid, a fine needle biopsy be obtained at the same time. He believes that this procedure is "the most prompt, the most economical, and the most accurate." Certainly, it is a prompt procedure since it can be done at the time of the aspiration. Whether it is economical depends on the sensitivity and specificity of the test.

The sensitivity and specificity of a test is influenced by the prevalence of the disease in the population under study. If the prevalence of the disease is low, the sensitivity will be low, and the procedure may cause further unnecessary testing, thereby increasing total health care costs.

No study has yet evaluated the sensitivity of fine needle aspiration biopsy for palpable breast masses. Solid masses will almost always be excised, however, regardless of the results of the fine needle aspiration biopsy. The literature referenced in Dr. Martin's recent article in *MMJ*[1] does support fine needle aspiration biopsy for occult breast lesions.[2-4]

Whether the procedure is the most accurate is interesting, in that other than removal of the mass, there is no diagnostic procedure that can be done to determine whether the mass is benign or malignant. In the cited articles, 9%-10% of fine needle aspiration biopsies were falsely negative.[3,5]

For a palpable breast mass, if fluid is not aspirated, surgical removal would be the definitive procedure, and fine needle aspiration biopsy would only add to the cost of health care without changing the care of the patient. Fine needle aspiration cytology represents another technological procedure that has not been subjected to a cost-effectiveness study, but which, as documented in the literature, is used extensively.[6-7]

Our Pictures Are Worth A Thousand Words.

Case #24

Baseline mammogram in a 56 year old asymptomatic woman.

DIAGNOSIS: Invasive Ductal Carcinoma.

Over 180,000 women in the United States will develop breast cancer in 1993. Mammography is still the best way to detect small breast cancers that result in decreased mortality and can be treated with breast conservation therapy. However, mammography may be non-specific and with the increased utilization of screening, numerous non-palpable, indeterminate lesions are detected. Until recently, the only way to determine whether these lesions were benign or malignant was with needle-guided open surgical biopsy.

Stereotactic breast biopsies are now performed in an outpatient setting in our Pomona office. This device uses a computer to calculate the exact 3D position of a non-palpable lesion and directs a needle into the abnormality for tissue sampling.

Figure 1 (craniocaudal view) shows a 1 cm. spiculated mass in the right inner breast (arrow). Local anesthesia is administered directly over the area to be biopsied. A small skin puncture is made and a 14-gauge needle attached to an automated biopsy gun is placed directly into the abnormality under computer guidance. Figure 2 demonstrates the pre-biopsy position of the needle with respect to the lesion. The post-biopsy film (Figure 3) shows the needle through the mass confirming the lesion was sampled.

Stereotactic biopsy has achieved the same sensitivity (95%) as open surgical biopsy. The advantages of stereotactic breast biopsy include improved cosmesis and decreased morbidity. The patient is able to resume routine activities the same day. In addition, the cost of stereotactic biopsy is less than half that of open surgical biopsy. With the emphasis on medical cost containment, this procedure could dramatically reduce open biopsies of benign breast lesions and two-stage surgical procedures for treatment of breast cancer.

Tuberculosis: Optimism, pessimism, frustration

Diane L. Matuszak, M.D., M.P.H.; Ebenezer Israel, M.D., M.P.H.; and James P.G. Flynn, M.D.

ABSTRACT: *The re-emergence of tuberculosis as a serious public health threat has captured the nation's attention. Tuberculosis more frequently affects the ethnic minorities and the socially and economically disadvantaged residents of Maryland. Effective regimens are available to treat and prevent tuberculosis. Consistent application of proven infection control measures and of treatment and prevention regimens will prevent the development and spread of multidrug-resistant tuberculosis.*

Dr. Matuszak is chairperson, Maryland Committee for the Elimination of Tuberculosis, and acting director, Office of Food Protection and Consumer Health Services, Maryland Department of Health and Mental Hygiene. Dr. Israel is director, Epidemiology and Disease Control Program, Maryland Department of Health and Mental Hygiene. Dr. Flynn is director, Corporate Rehabilitation Services, University of Maryland Medical System, and former director, Division of Respiratory Diseases, Maryland Department of Health and Mental Hygiene.

The availability of isoniazid (INH), para-aminosalicylic acid (PAS), and streptomycin, soon followed by a series of other effective chemotherapeutic agents in the early and mid 1950s, heralded a new era in tuberculosis management. Until that time, the outcome of care for patients with tuberculosis was measured in terms of attenuating or stopping the progression of disease, as distinct from cure. Health care professionals were aware of the relationship between tuberculosis and social indicators within the community, such as poverty, overcrowding, chronic diseases, and alcoholism. To manage patients who had the most advanced disease and presented the greatest public health challenge, sanitoria were introduced. In those facilities, patients were isolated for periods of 18 to 24 months, and therapy consisted of bed rest, controlled diet, and exposure to fresh air and sunlight, as well as surgical procedures. Following discharge from a sanitarium, patients were usually followed for life in ambulatory care settings.

Before the advent of chemotherapy, clinicians and public health officials noted a decline in tuberculosis incidence, which has been attributed to improvement in living conditions.[1–4] Despite the availability of suitable medications to prevent and treat the disease, many health care leaders and policy-making officials still thought that bed rest and isolation, in addition to long-term follow-up, were warranted. This belief persisted even after a study in Madras, India, showed that ambulatory patients, living in the

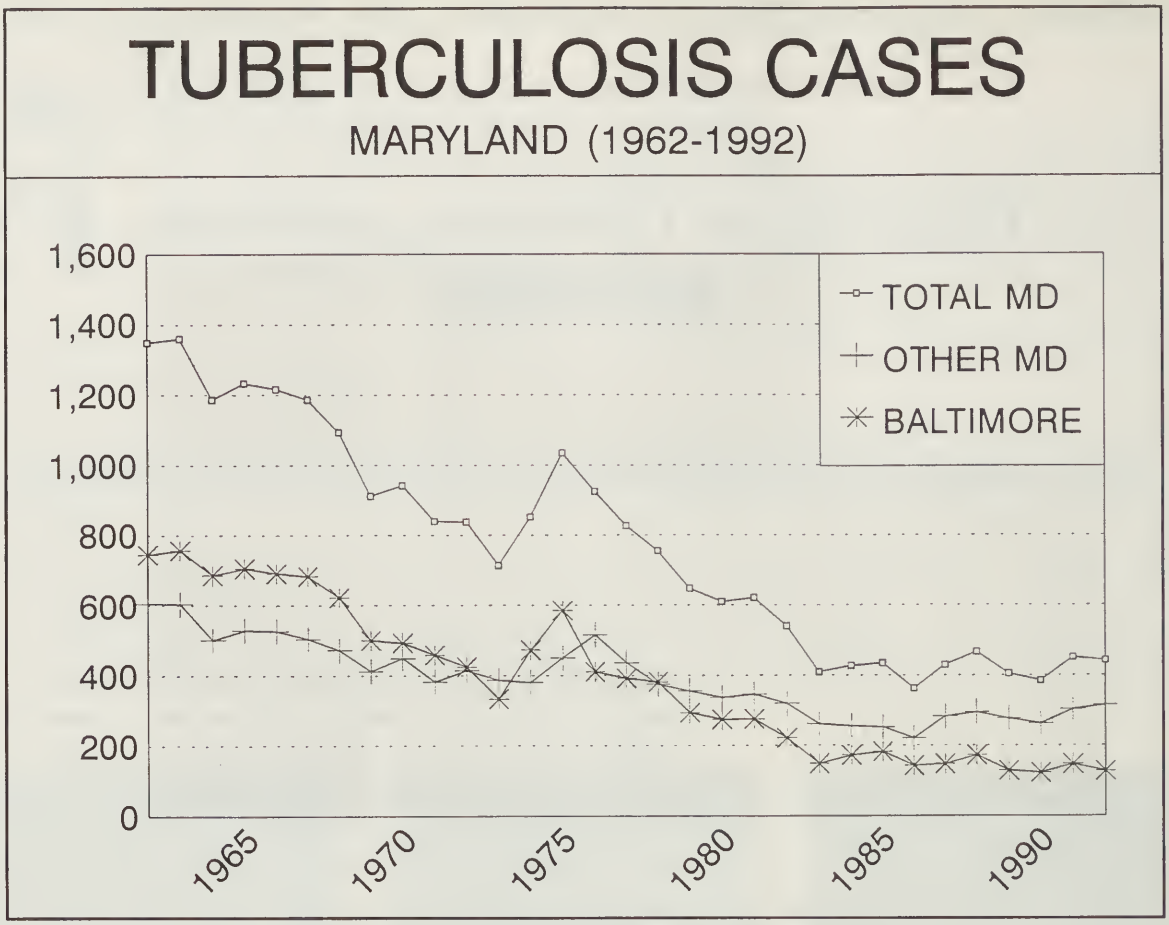

Figure 1. Number of tuberculosis cases in Maryland (1962–1991).

community and taking prescribed medication, had outcomes as good or better than hospitalized patients receiving the same chemotherapeutic regimen.[5]

With the advent of rifampin, ethambutol, and pyrazinamide, and the demonstrated effectiveness of short-course chemotherapy in ambulatory care settings, patients could be cured. They did not need hospitalization, except, in some instances, for diagnosis, initiation of chemotherapy, or management of other clinical conditions. The major factors in successful tuberculosis treatment were compliance with drug regimens and sensitivity of the organisms to these agents.[5–7]

By the late 1970s, most state and privately run sanatoria had closed. At that time, newly reported cases tended to be among older individuals born in the United States and infected by the tubercle bacillus earlier in their lifetimes. Emphasis was placed on management of all tuberculosis patients within the mainstream of medicine, with epidemiological follow-up by local health departments.[8] Paralleling these dramatic developments, strategies were defined to eradicate tuberculosis by the end of the twentieth century.[9] The future looked particularly bright for the elimination of tuberculosis by 2010.

However, all was not quite right. Unless patients were appropriately supervised, they had the potential to develop hepatitis while taking preventive INH.[10, 11] Many physicians, even those specializing in internal medicine, lacked knowledge regarding the management of tuberculosis patients.[12] Additionally, demographic changes influenced tuberculosis incidence, such as the immigration of persons with infection or frank disease, many from countries with a high prevalence of drug-resistant organisms.[13,14] Over the past decade, the advent of human immunodeficiency virus (HIV) has created a large reservoir of exquisitely susceptible individuals, further complicating management of this disease.[15]

Tuberculosis control in Maryland

The number of tuberculosis cases reported each year in Maryland decreased significantly over the past three decades (**Figure 1**). The decrease in case rates has been particularly dramatic in Baltimore City. In 1962, Baltimore accounted for more than 56% of the tuberculosis cases reported in Maryland; in 1991, the city had fewer than 32% of the cases.

The burden of tuberculosis falls most heavily on the nonwhite population, predominantly African Americans in Baltimore and foreign-born minorities elsewhere in the state. In the past, the most affected age group was the elderly. With the advent of the HIV epidemic, there has been a shift to younger

age groups and an increasing prevalence of extrapulmonary involvement. Of increasing concern is a rise in the number of drug-resistant cases over the past two or three years. Preliminary 1991 and 1992 data indicate a reversal of the downward trend in tuberculosis rates: in 1991, the incidence was 17% higher than in 1990; in 1992, rates stabilized (Division of Tuberculosis Control, Maryland Department of Health and Mental Hygiene).

Table 1. Conditions associated with increased tuberculosis risk

- ▲ Intravenous drug use
- ▲ Hematologic or reticuloendothelial neoplasm
- ▲ Immunosuppressive therapy, including long-term (i.e., > three months) high-dose corticosteroid therapy (equivalent to 15 mg/day of prednisone)
- ▲ Silicosis
- ▲ Renal dialysis
- ▲ Insulin-dependent or poorly controlled diabetes mellitus
- ▲ Nutritional deficiency with substantial loss of body weight (10% to 15% below ideal body weight)

Measures taken to control tuberculosis in Maryland communities mirror national trends. Tuberculosis is usually managed on an outpatient basis with regular patient monitoring. Except for patients with drug-resistant disease, inpatient stays, when admission occurs at all, are typically of short duration and in general medical facilities.[16,17]

Each of Maryland's 23 counties and the city of Baltimore has a tuberculosis control program. These programs are responsible for monitoring the infectiousness (potential for transmission) of all individuals reported as having suspected or confirmed tuberculosis and residing in the jurisdiction. Each program can receive referrals and provide tuberculosis-related care for suspected and confirmed cases. The local health department also investigates contacts to identify persons who have undetected tuberculosis as well as persons who are infected with the tubercle bacillus and may benefit from preventive therapy. Preventive therapy is provided in selected cases. Physicians caring for tuberculosis patients should expect regular follow-up by the local tuberculosis control program.[16]

Diagnosis

In the diagnosis of tuberculosis, tuberculin skin testing is an important adjunct to a thorough history and physical examination. A negative skin test does not rule out tuberculosis. The Mantoux test may be falsely negative due to a variety of factors, including overwhelming infection with *Mycobacterium tuberculosis*.[18] HIV-infected persons with tuberculosis are frequently anergic.[19] A delayed hypersensitivity immune response is indicative of latent infection with a mycobacterial species. Multiple puncture tests have limited usefulness in screening populations with a very low prevalence of tuberculosis infection.

The gold standard for tuberculosis skin testing is the Mantoux method. This method involves the intradermal injection of 0.1 ml of purified protein derivative (PPD) tuberculin 5 TU (intermediate strength). The injection site should be the volar aspect of the forearm.[18] The dose or concentration of PPD does not vary with size or clinical condition of the patient. There is no age restriction on tuberculin skin testing. Some authors have recommended two-step skin testing in the elderly to boost an immune response that has waned with age.[20-22]

In Maryland, our experience over the past decade has not demonstrated a significant rate of the booster phenomenon, and the tuberculosis rate among nursing home patients is extremely low. Therefore, two-step skin testing of nursing home residents, as a routine procedure, is not judged to be necessary.[23,24] (Unpublished data compiled by Mr. S. Morita for the Maryland Department of Health and Mental Hygiene, 1981.)

Tuberculin skin tests should be read after 48 to 72 hours. The amount of induration should be measured perpendicular to the long axis of the arm.[18] The presence of erythema without induration has no significance. For persons at markedly increased risk of tuberculosis, including those with clinical or radiographic evidence of disease, a history of recent close contact with a person with tuberculosis, or immunosuppression or HIV infection, induration measuring 5 mm or more in diameter is considered a positive response.[25,26] In Maryland, we have also recommended a 5 mm cut point for skin testing performed on infants younger than one year of age. This is considered warranted because of the very low probability that an infant would have been exposed to a mycobacterial agent other than tuberculosis and the very high risk of serious complications should tuberculosis develop in someone this young.[16]

For persons at moderately increased tuberculosis risk, the skin test reaction is considered positive when induration measures 10 mm. Increased tuberculosis risk has been associated with the conditions listed in **Table 1.** For persons who have no tuberculosis risk factors, induration measuring >15 mm would be considered a positive response.[25] A history of vaccination with bacille Calmette-Guérin (BCG) should not influence tuberculin skin test interpretation. A positive skin test should still be interpreted as evidence of probable tubercle bacillus infection.[26]

A chest radiograph is essential in suspected pulmonary disease. Periodic chest films during therapy are no longer

routinely recommended, although an occasional film during therapy may be useful in monitoring response in culture-negative cases. Clinical specimens (e.g., sputum, pleural fluid, cerebrospinal fluid [CSF], blood) should be submitted for microscopic examination with staining for acid-fast organisms and for mycobacteriologic cultures. Any newly positive culture processed by the Department of Health and Mental Hygiene (DHMH) Mycobacteriology Laboratory will be tested for antimycobacterial drug resistance. Drug sensitivities should be specifically requested when submitting specimens to other laboratories or submitting follow-up specimens from persons who have had unsatisfactory clinical responses.

For pulmonary cases, we recommend obtaining three sputum specimens taken at least 24 hours apart before beginning therapy. If any of these cultures grows *M. tuberculosis,* sputum cultures should be obtained at least monthly until the cultures are no longer positive. When the currently recommended treatment regimens are employed, positive sputum cultures should convert to negative within two to three months. If cultures are still positive after three months, the patient should be evaluated carefully for noncompliance, and drug resistance should be ruled out by again obtaining drug sensitivity tests.[16] While awaiting the results of drug sensitivity tests, patients should be placed on two additional antimycobacterial drugs to which the organism was sensitive on initial testing.

Recent innovations in mycobacteriology are permitting more rapid growth and identification of mycobacterial species. These innovations include the radiometric system for culturing (BACTEC), DNA (deoxyribonucleic acid) probes, the use of monoclonal antibodies, and gas chromatography.[27-37] Research to develop a serologic test that would permit disease activity estimation by following rises and falls in the antibody titer is increasing.[38-40]

Treatment

The Advisory Council for the Elimination of Tuberculosis of the Centers for Disease Control and Prevention (CDC) and the DHMH Division of Tuberculosis Control currently recommend a treatment regimen that includes INH, rifampin (RIF), pyrazinamide (PZA), and ethambutol (EMB) or streptomycin for the initial induction phase, lasting eight weeks. During the initial two weeks, all drugs are given daily. For the next six weeks, drugs are given twice weekly. The induction phase is followed by at least four months of continuous treatment with INH and RIF given twice weekly. When this regimen is used, all doses must be directly observed.[41,42] This regimen is used for both pulmonary and extrapulmonary disease and in all age groups. With this regimen, most patients become culture negative within two months.

Pregnant women with active disease should be treated with INH, RIF, and EMB during the induction phase; the period of continuation with INH and RIF should be extended to seven months, for a total treatment duration of nine months.[16] Six-month regimens are not appropriate for persons who have both tuberculosis and HIV infection. In these patients, treatment should be continued for at least 9 to 12 months and at least 6 months after the sputum cultures have become negative.[16] Patient compliance is very important in tuberculosis treatment.

If the sputum culture has not converted to negative within two to three months, the patient should be evaluated for poor compliance or drug resistance. Since *M. tuberculosis* is capable of rapidly becoming drug resistant, successful treatment depends on using at least two antimycobacterial agents to which the organism is sensitive. It is essential, therefore, that one never add a single drug to a failing regimen.[16] Consultation on patient management is available from local health departments and from the Maryland Division of Tuberculosis Control (410-225-6698).

Recent reports of outbreaks of multiple-drug-resistant tuberculosis,[43-46] the increasing prevalence of drug resistance among reported cases, and the recent unavailability of several standard antimycobacterial drugs[47] highlight the need to develop new antibiotics. The last major drug introduced for tuberculosis treatment was rifampin, introduced two decades ago. Some fluoroquinolones or macrolides may have limited usefulness, particularly in the treatment of multiple-drug- resistant tuberculosis.[48-54]

Infection control

Since the currently recommended treatment regimens rapidly render the person with tuberculosis noncommunicable, the at-home isolation period, for most persons, has been reduced to two to three weeks unless drug resistance is suspected or the patient is immunosuppressed.[42] After this period, the person may return to normal activities of daily living while taking oral medication over the next six months. For those with drug-resistant disease, the restriction period is longer, but many of these patients may also be managed quite successfully at home with assistance from the local health department.

When persons suspected of having pulmonary tuberculosis are admitted to hospitals, they should be placed on acid-fast bacilli (AFB) isolation. AFB isolation procedures include placement in a private room with adequate ventilation, which is vented directly to the outside away from air intakes and people. The air flow direction must be from the clean area to the contaminated (patient-occupied) area (i.e., the patient's room should be under negative pressure). This negative pressure is best maintained by close-fitting doors that are kept closed. AFB isolation is not necessary for patients having only extrapulmonary involvement unless there is a risk of *M. tuberculosis* aerosolization into infectious droplet nuclei.

When health care workers enter the room or perform clinical procedures, the risk of infected droplet nuclei inhalation can be

reduced by use of well-fitted, disposable particulate respirators capable of filtering out particles >1 micron in diameter.[55] The CDC and the Occupational Safety and Health Administration (OSHA) continue to consider recommendations of the National Institute for Occupational Safety and Health (NIOSH) on the use of powered air-purifying respirators and on dust, mist, and fume respirators.[56]

Staff involved in the care of tuberculosis patients and those who process clinical specimens in the mycobacteriology laboratory should have a Mantoux skin test on employment. Those with negative baseline skin tests should be retested, at least annually. Any staff member whose skin test converts to positive should be offered preventive therapy.[25]

Prevention

The first weapons in our prevention arsenal are early diagnosis and effective treatment of pulmonary tuberculosis. These minimize the chance that uninfected contacts will be exposed to infective droplet nuclei and become infected.

When individuals become infected with *M. tuberculosis* through inhalation of infective droplet nuclei, they have a 5% risk of progressing to active disease within the next two years. Thereafter, the risk is 5% for the individuals' remaining lifetime. The lifetime risk is markedly increased in persons with HIV infection and has been estimated to be more than 5% per year.[19]

The majority of tuberculosis cases reported each year develop in persons with latent tubercle bacillus infection. Most are preventable with INH chemoprophylaxis. Preventive INH therapy is safe and effective when used as recommended. Preventive therapy is recommended for persons with a positive tuberculin skin test who are at high risk of progression to active tuberculosis. This group includes persons who have been in recent close contact with someone who has tuberculosis, persons whose chest films show stable fibrotic lesions, persons whose skin tests have become positive in the past 24 months, and persons with special medical conditions that increase their risk. Increased tuberculosis risk has been associated with HIV infection as well as the conditions presented in **Table 1.** Preventive therapy is also recommended for anyone who is skin test positive and 35 years of age or younger. For those over 35 years of age, in the absence of another factor that increases the risk of developing tuberculosis, INH preventive therapy is not recommended because of the increasing risk of INH-associated hepatitis with advancing age.[10,11,25]

The Division of Tuberculosis Control currently recommends daily preventive therapy with INH, 10 mg/kg, not to exceed 300 mg/day, for at least 6 continuous months but not more than 12 months. We recommend that the duration of preventive therapy be increased to at least 12 months for persons whose chest x-rays show fibrotic lesions measuring >2 cm^2 and for persons with HIV infection.[16]

The only vaccine currently available is BCG. This vaccine has been used extensively throughout the world, particularly in third-world countries. The BCG vaccine effectiveness is variable, and it may not prevent infection.[57,58] Tuberculosis is a major cause of morbidity and mortality throughout the world. Researchers continue to look for a more effective vaccine.[59,60]

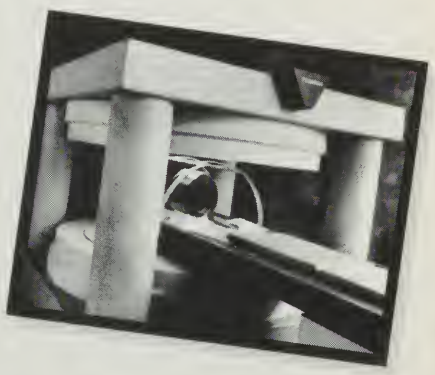
A NEW OPEN MRI SERVICE AT DOCTORS GROOVER CHRISTIE + MERRITT



Now MRI is open to more patients than ever before.

Announcing Maryland's First Radiologist-Directed Open MRI Service.

Ideally suited for special needs patients.
Claustrophobics, the obese or those connected to life support systems are some of the patients who will be more comfortable with nonconfining and quiet Open MRI Service. But that's only one reason you'll be more comfortable referring patients to it.

Peer-to-Peer professional consultation.
GCM is the oldest continuing radiology practice in the nation. Our Open MRI Service is Maryland's first radiologist-directed facility using Toshiba's advanced Access LPT technology. So you can trust us to treat your patients with care, interpret test results accurately, and talk to you as one doctor to another.

A single source for every radiological need.
Please call today to learn more about GCM's Open MRI Service and other capabilities.

Substance abuse as a factor in the causality, severity, and recurrence rate of traumatic brain injury

Daniel A. Drubach, M.D.; Mark P. Kelly, Ph.D.; Michelle M. Winslow, B.A.; and James P.G. Flynn, M.D., M.P.H.

ABSTRACT: *The effects of substance abuse on the cause, severity, and recurrence of traumatic brain injury in 322 admissions to a large rehabilitation inpatient facility are explored. Study patients tended to be young and predominantly male. Few had completed high school and a significant minority had a history of cerebral dysfunction. Patients tended to have moderate to severe closed head injuries. Motor vehicle crashes were the most common cause of injury, but patients reporting drug or drug and alcohol abuse were more likely to sustain violent injuries (e.g., gunshot wounds).*

Dr. Drubach is assistant professor of neurology and psychiatry and chief of the Neuropsychiatry Clinic at the University of Maryland School of Medicine, as well as director of Brain Injury Services at Montebello Rehabilitation Hospital, University of Maryland Medical System. Dr. Kelly is assistant professor of neurology, University of Maryland School of Medicine, and assistant director of the Brain Injury Unit at Montebello Rehabilitation Hospital. Ms. Winslow is a neuropsychology technician on the Brain Injury Unit at Montebello Rehabilitation Hospital. Dr. Flynn is director of Corporate Rehabilitation Services for the University of Maryland Medical System and clinical professor of neurology, University of Maryland School of Medicine.

Reprints: Daniel A. Drubach, M.D., Montebello Rehabilitation Hospital, 2201 Argonne Dr., Baltimore, MD 21218.

One of the most substantial risk factors for traumatic brain injury is substance abuse—both chronic use and use immediately prior to trauma. In one series of patients hospitalized for traumatic brain injury, 25% had been treated previously for alcohol abuse.[1] One-half or more of fatally injured drivers and pedestrians described in another series had a history of excessive alcohol use.[2] Spradeo and Gill[3] found that, of 102 patients admitted to a large trauma center for head injury, 67% of those tested had a positive blood alcohol level, with about half of those tested being intoxicated (100 mg/100 ml). Thirty percent of a group of adult pedestrian trauma patients had consumed alcohol prior to injury.[4] The American Medical Association's Council on Scientific Affairs concluded that between 40% and 55% of fatally injured drivers had blood alcohol concentrations of .10% or more.[5] Of a series of patients sustaining head injuries in domestic accidents serious enough to warrant admission, 46% had used alcohol.[6]

In recent years, evidence has begun to accumulate for the association of abused substances, other than alcohol, with traumatic injury. Investigators at an urban trauma center reported that 65% of patients with trauma sustained in a violent crime and 43% of those with trauma related to

Table 1. History of head injury and substance abuse among 322 patients with traumatic brain injury

History of head injury	
Yes	27%
No	70%
Unknown	3%
History of substance abuse	
Alcohol	33%
Drug	8%
Alcohol and drug	29%
None	30%

accidental injury had used cocaine.[7] Milner[8] observed that marijuana users had twice the expected frequency of traffic crashes, while Soderstrom and colleagues[9] found that a third of patients seen at a major trauma center tested positive for marijuana. O'Donnell and coworkers[10] found that 62% of 47 patients with traumatic spinal cord injury and admitted to a rehabilitation setting had alcohol- or drug-related injuries.

Although data clearly implicate substance use as a risk factor for injury, the relationship between chronic substance abuse, severity of trauma, and the course of recovery remains largely unknown. The severity of traumatic brain injury can be measured by many different methods. The Glasgow Coma Scale (GCS) score, length of posttraumatic amnesia (PTA), and, to a lesser degree, length of hospitalization are some of the most commonly used. Other investigators[11,12] found that alcohol intake prior to trauma is associated with increased severity of injury. Spradeo and Gill[3] reported increased length of stay, longer duration of agitation, and poorer cognitive status at discharge in head-injured patients with admitting blood alcohol levels of 100 mg/100 ml or greater.

Other recent papers in this journal have reviewed the epidemiology,[13] comorbidity factors and ancillary medical requirements,[14] and outpatient management[15] of brain-injured patients. We explored the effects of substance abuse on the cause, severity, and recurrence of traumatic brain injury in 322 admissions to a large rehabilitation inpatient facility.

Table 2. Causes of head injury among 322 patients at a rehabilitation hospital

Car crash	34%
Motorcycle crash	15%
Pedestrian struck	11%
Fall	12%
Blunt assault	14%
Gunshot wound to the head	6%
Other	8%

We also identified the distinguishing characteristics of traumatic brain injury patients with and without evidence of substance abuse.

Method

The sample for this study comprised 322 patients admitted to the Brain Injury Unit at Montebello Rehabilitation Hospital over a four-year period between 1988 and 1991. This unit provides acute multidisciplinary medical rehabilitation to individuals with traumatic brain injury and related disorders. For purposes of the present project, only patients with cerebral insults of traumatic origin were included. Patients typically are admitted approximately one month after injury and remain in rehabilitation approximately seven to eight weeks.

Study data were taken from a Brain Injury Unit database maintained by the authors. Database material is gleaned from a combination of review of the medical records as well as the history and physical examination by the attending physician, clinical interview of the patient by a neuropsychologist, and a detailed social history obtained by the staff social worker from a patient's family member. Determination of the presence of substance abuse reflected the unit's senior neuropsychologist's clinical judgment following a review of information from the above three sources.

Substance abuse is defined by *DSM III-R*[16] criteria as a maladaptive pattern of substance use persisting for at least one month (or repeatedly over a longer period). The *DSM III-R* also requires that the patient not qualify for a diagnosis of substance dependence to receive a substance abuse diagnosis. In our setting, however, there often was insufficient information to determine if an individual met the more rigorous criteria for substance dependence, and some individuals characterized as substance abusers probably met the criteria for dependence. For purposes of the present study, patients were categorized into one of four substance abuse categories: (1) alcohol abuse, (2) drug abuse, (3) alcohol and drug abuse, or (4) no substance abuse.

For data analyses involving continuous variables, analysis of variance (ANOVA) was used. For analysis involving discrete variables, the chi-square test was used.

Results

Patients tended to be young (mean age, 34.7±13.8 years) and predominately male (85%). Many had failed to complete high school. A significant minority had a history of cerebral dysfunction prior to their current injury. The majority had a reported history of substance abuse (**Table 1**). Review of injury severity data suggests that these patients tended to have moderate to severe injuries (mean acute admitting GCS score, 9.5±3.6; duration of PTA, 36.9±34 days), and the vast majority had closed head injury (86%). Motor vehicle crashes were the most common cause of injury, but other etiologies were also well represented (**Table 2**).

Table 3. Relationship of substance abuse to demographic and injury severity variables

	No substance abuse (n=98)	Alcohol abuse (n=107)	Alcohol & drug abuse (n=93)	Drug abuse (n=24)	F	p
Age	36.7*	38.3**	30.3	27.5	9.02	<.0001
	(16.8)	(14.4)	(8.3)	(6.5)		
Education	11.8***	11.1	10.3	11.1	5.20	<.002
	(2.5)	(2.8)	(2.5)	(1.5)

	(45.0)	(41.5)	(40.1)	(34.4)		

Contents of cells are group means and standard deviations.
Alpha levels were adjusted for the number of comparisons (Tukey HSD Multiple Comparisons).
**p<.05 compared with drug and with alcohol and drug groups*
***p<.01 compared with drug and with alcohol and drug groups*
****p<.001 compared with alcohol and drug groups*
GCS = Glasgow Coma Scale; NS = not significant; PTA = posttraumatic amnesia

Inferential data are summarized in **Table 3**. Analyses of patients' ages indicate statistically significant differences among substance abuse groups ($F [3,317] = 9.02, p = .00001$). Patients with no prior history of substance abuse were significantly older than patients with a history of drug abuse and patients with an alcohol and drug history. Similarly, patients with a reported history of alcohol abuse were significantly older than patients in the drug and in the alcohol and drug groups.

Additional analyses of demographic data revealed an overall significant difference between substance abuse groups in years of education ($F [3,311] = 5.20, p = .0016$). Patients with no history of substance abuse had more years of education than subjects reporting an alcohol and drug history ($p < .0005$). No other comparisons of substance abuse groups on educational levels revealed statistically significant differences.

Twenty-seven percent of patients in this sample had sustained a prior head injury (**Table 1**). Analysis of the relationship between type of substance abuse and history of prior head injury revealed that patients reporting no substance abuse history were least likely to have a prior head injury ($\chi^2 [3, N=322] = 11.69, p = .009$). Sixteen percent of the no substance abuse sample had a prior head injury compared with 22% of the drug abuse, 31% of the alcohol abuse, and 38% of the alcohol and drug abuse samples.

Univariate analyses of variance found no significant differences among the four substance abuse groups on measures of injury severity (**Table 3**). Groups did not differ with regard to GCS scores at the time of admission to an acute hospital ($F [3,258] = 2.105, p = .10$) or in the mean length of PTA ($F [3,274] = 0.548, p = .650$). There were also no differences between the substance abuse groups in either mean lengths of stay of acute hospitalization ($F [3,311] = 0.910, p = .436$) or mean lengths of rehabilitation hospitalization ($F [3,318] = 0.945, p = .0419$).

As shown in **Table 4**, patients reporting either drug abuse or drug and alcohol abuse were more likely to sustain violent injuries (e.g., gunshot wounds or blunt assault) than patients reporting only alcohol or no substance abuse ($\chi^2 [3, N=318] = 13.94, p = .003$). Thirty-seven percent of the drug abuse sample and 30% of the drug and alcohol abuse sample sustained violent injuries compared with 16% of the alcohol sample and 13% of the no substance abuse sample.

Discussion

Our patient population was somewhat biased toward more severe trauma in that it included only patients who required inpatient rehabilitation subsequent to trauma. Also, our institution is such that ability to pay for rehabilitation is not a determinant of admission. This could have resulted in admission of patients with a lower socioeconomic status than those admitted to other private facilities. Taking these limitations into consideration, we believe that our patient population is highly representative of the population that suffers traumatic brain injury in the United States.

Table 4. Nonviolent vs violent cause of injury with substance abuse

	No substance abuse	Alcohol abuse	Alcohol & drug abuse	Drug abuse
Nonviolent	85	90	62	15
Violent	13	17	27	9

Contents of cells are numbers of subjects.

Among victims of traumatic brain injury, drug abusers, with or without an alcohol abuse history, tended to be younger than patients who abused only alcohol or had no substance abuse history. Drug abuse appears to enhance the risk for brain injury relatively early in adult life. Also, patients with no history of substance abuse had more years of education than patients reporting such history. Others have noted that academic deficiency serves as a risk factor for brain injury.[17] Our data at least raise the possibility that academic deficiency interacts with substance abuse to increase this risk.

We did not find any significant differences in severity of traumatic brain injury as measured by GCS score, PTA, or length of acute or rehabilitation hospitalization among patients with no history of substance abuse or the three groups of patients with this history. While we believe this to be an important finding, our conclusion has several possible limitations.

First, our sample was restricted in that it primarily contained patients with relatively severe injuries; a restriction in the range of scores reduces the probability of detecting significant relationships. It is of interest that follow-up analysis did find, as expected, a significant correlation between GCS scores and length of both acute hospitalization ($r [254] = -0.274$, $p < .001$) and rehabilitation hospitalization ($r [260] = -0.356$, $p < .001$). There were even more striking correlations between PTA and length of acute hospitalization ($r [271] = 0.425$, $p < .001$) and length of rehabilitation hospitalization ($r [276] = 0.626$, $p < .001$). Because these correlations are significant and in the expected direction, it seems unlikely that our failure to find relationships between the presence of substance abuse and injury severity is merely an artifact of restricted range-of-severity scores.

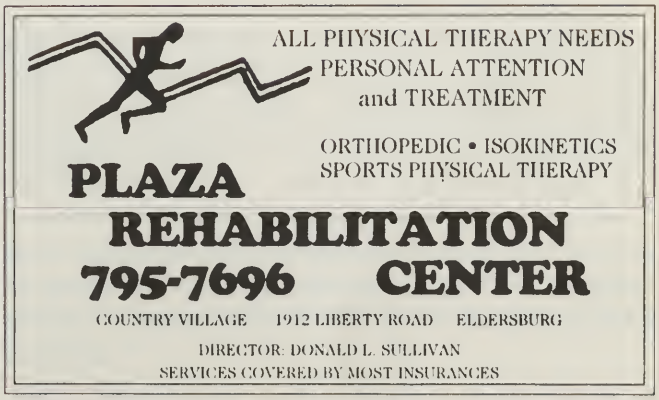
Second, we did not, as others have, evaluate whether patients had used substances immediately prior to injury. It is difficult to compare our studies with other studies that have done just this. We do find this conclusion, however, to be interesting, since we would expect that the additive effect of both a history of substance abuse and trauma would amplify the injury severity. We find it encouraging that a history of substance abuse did not complicate the care of brain-injured patients to the extent that more lengthy hospitalization was required. It is possible that substance abuse might affect other aspects of recovery from traumatic brain injury, including functional and neurobehavioral outcome. We are currently evaluating this possibility.

In our study, there was a strong correlation between drug use and suffering a violent, as opposed to nonviolent, traumatic brain injury. Although this finding is not surprising, we are not aware of it having been reported in the past. Lindenbaum and colleagues[7] reviewed the toxicology screens of 169 patients admitted to an urban trauma center (type of trauma varied) and found that, for patients sustaining trauma in violent crimes, 49.9% tested positive for drugs that were illicit or had abuse potential, 30.9% tested positive for drugs and alcohol, 6.2% were positive for alcohol only, and 13.5% had negative screens. There was also a high incidence of positive screens for drugs (with or without alcohol) in patients with accidental injuries in their sample.

More patients in the violent crime groups tested positive for drugs than those in the accidental injury group, but the difference was not statistically significant. When specific drugs were examined, a significantly greater number of patients in the violent crime groups tested positive for cocaine. While the methodologies of the two studies vary, both point to an increasing role of drug abuse in the causation of trauma. The specific association with traumatic brain injury and with violent crime deserves evaluation in other samples.

Finally, we found a strong correlation between a substance abuse history and the risk of having suffered a traumatic brain injury in the past. It is well known that a history of head injury puts a patient at substantially higher risk for further head injuries, but the mechanism for the additional risk has not been delineated. Our data strongly suggest that substance abuse, at least in part, contributes to this increased risk. This has been our informal clinical impression for some time. The effects of traumatic brain injury may be cumulative.[18] Patients who have sustained brain injuries should be offered counseling and support by their physician, emphasizing that substance abuse may increase the risk of re-injury and compromise the long-term outcome. In many cases, formal substance abuse treatment may be appropriate.

Unfortunately, without any degree of cynicism, many staff members in acute care and rehabilitation settings comment on the brain injury that is waiting to occur. Such individuals are aware of a "syndrome" comprising youth, fast-moving vehicles, a poor school record, non-use of helmets and other protective gear, and substance abuse. There are state-of-the-art settings to manage the immediate and long-range negative results of the traumatic event. The time has come, however, to place greater emphasis on prevention, a theme reflected in other settings in the health care industry. These efforts will include not only the health care worker and the individual at



risk, but also educators, law enforcement personnel, and those formulating health care policy, as well as those responsible for paying the bill.[19]

Presented in part at the American Public Health Association 118th Annual Meeting, New York, New York. September 1990.

ABSTRACT: *In 1988, a hepatitis A epidemic began in Baltimore, Maryland. A total of 607 cases were reported to the Baltimore City Health Department between the period November 1, 1988, and December 31, 1989. The health department conducted case investigations to identify factors important to the development of control measures. Immunoglobulin was given to appropriate contacts, and an educational campaign was initiated.*

Of the 607 reported cases, 63% were white and 57% were male. Cases were geographically clustered within 5 of Baltimore's 23 zip codes. Among the 242 adults interviewed, 43% self-reported drug use and 44% were unemployed. Twenty-one percent of the adults and 56% of the children reported contact with either a suspected or confirmed case of hepatitis.

Despite control efforts, the epidemic continued through 1990. Barriers to implementing traditional control measures resulted in continuing transmission of hepatitis A in the community.

Nationwide epidemics of hepatitis A have not been noted since 1971, and from that year through 1983, the reported hepatitis A incidence declined. Beginning in 1984, however, national rates began to increase, from 9.3 per 100,000 in 1984 to 14.4 per 100,000 in 1989. The initial rate increases resulted from epidemic cycles in the western United States followed by increases in the eastern United States beginning in 1988.[1]

According to national data, over the past three decades there have been demographic changes in those groups infected by hepatitis A.[1-3] Additionally, drug abusers and adults have become recognized as a group at risk for hepatitis A infection.[4-7]

Along with many other states, Maryland experienced an increase in reported hepatitis A cases beginning in 1988.[8] Baltimore City was particularly hard hit, with 40 cases reported in 1988, increasing to 597 in 1989.

The rapid spread of hepatitis A in hard-to-reach groups in Baltimore made the source of this epidemic problematic to define, and control measures difficult to implement. The Baltimore City Health Department (BCHD) conducted expanded case investigations to explore possible causes of the epidemic, identify target populations for control measures, and identify factors that might influence control measures.

Methods

Case reporting. A case of hepatitis A was defined as a Baltimore city resident who had a positive HAV IgM (hepatitis A virus immunoglobulin M) antibody test, with or without symptoms. Since date of onset was often not reported, the "action date" of each case was defined as the earliest of the following dates: date of onset of symptoms, date of blood specimen collection, or date of hospitalization. Cases included in the analysis were those reported between November 1, 1988, and December 31, 1989, who had an action date within that period.

Case investigation. As the beginning of the hepatitis A outbreak was identified, all cases reported to the BCHD within one month of the action date were referred to 15 district nurse investigators for home investigation. Nurses used a standard risk assessment questionnaire and provided education. If contact was not made on the initial home visit, a letter was left asking the case to call the health department. Cases were closed after multiple unsuccessful attempts to contact cases. As the epidemic progressed, limited staffing precluded investigation of some cases.

Control measures. All close contacts (household members, sexual partners, or those spending significant time in the case household) without a prior history of hepatitis A were referred for immunoglobulin (Ig), if it could be administered within two weeks after the last exposure.[9] In August 1989, in an effort to stop tertiary spread, the BCHD decided to allow contacts to receive Ig up to four weeks after exposure. Cases and contacts were educated about preventing transmission by appropriate hygiene and hand washing and were given fact sheets on hepatitis A. Per Maryland regulation, food handlers were excluded from work until one week after the onset of jaundice, or two weeks after the onset of symptoms if the individuals were not jaundiced.

Educational interventions. In August 1989, a medical bulletin was sent to all licensed physicians and health care facilities in the Baltimore metropolitan area. The bulletin included background information on diagnosis, epidemiology, and prevention, and stressed the importance of prompt reporting and the necessity of providing Ig to contacts.

In addition, a joint press release from Baltimore City, Baltimore County, and the Maryland Department of Health and Mental Hygiene (DHMH) was released in August 1989, public service announcements were presented, community presentations were given to public groups, and in-service training on the epidemiology and prevention of hepatitis A infection was provided to physicians and infection control practitioners.

Data analysis. Data were abstracted from reporting forms and case investigation questionnaires using a standardized data collection instrument. Rates were calculated using the number of cases identified during the 14-month study period and 1990 census figures for Baltimore City.[10]

Treatment-seeking delay (i.e., the time from the onset of illness to the date the case was seen by a health care provider) was analyzed by comparing the date of onset of symptoms to the date of blood work (which was used as a proxy for the visit date to a health care provider). Data from a sample of 41 cases with onset in July and August 1989 were used to analyze reporting delays by comparing time between onset of illness, date seen by a health care provider, date the BCHD first became aware of the case, and date the case was located by nurse investigators.

To estimate baseline susceptibility to hepatitis A in a young, inner city population, a blinded seroprevalence survey of HAV IgG antibody was conducted on the sera of 150 young adult clients of BCHD's clinic for sexually transmitted diseases (STD). Data were computerized and analyzed using the Statistical Analysis System for Personal Computers (PC SAS, Cary, North Carolina). The chi-square test[11] was used to assess the relationship between selected variables and locate-for-interview status.

Results

The number of hepatitis A cases in Baltimore City in the 14-year period 1979 through 1992 is shown in **Figure 1**. During the period November 1, 1988, through December 31, 1989, 607 cases of hepatitis A were reported to the BCHD (**Figure 2**). Cases peaked in August and September 1989 (approximately 90 cases per month) following release of the medical bulletin and press coverage in August.

Hepatitis A infection rates per 100,000 by age, race, and sex are shown in **Figure 3**. Of the 607 reported cases, 345 were males (rate of 100 per 100,000) and 262 were females (67 per 100,000). The median age of cases was 24 years among females and 28 years among males. Males outnumbered females in all age categories except those 15 years of age or younger. Whites had a rate of 133 per 100,000 (383 cases) compared with a rate of 50 per 100,000 for nonwhites (184 African Americans, 2 Hispanics, and 38 cases of unknown race). Most cases were among adults 18 years of age and older (459, 83 per 100,000). The rate among children less than 18 years of age was 76 per 100,000. Of note is the remarkable difference in sex-specific rates by race among children (**Figure 3**).

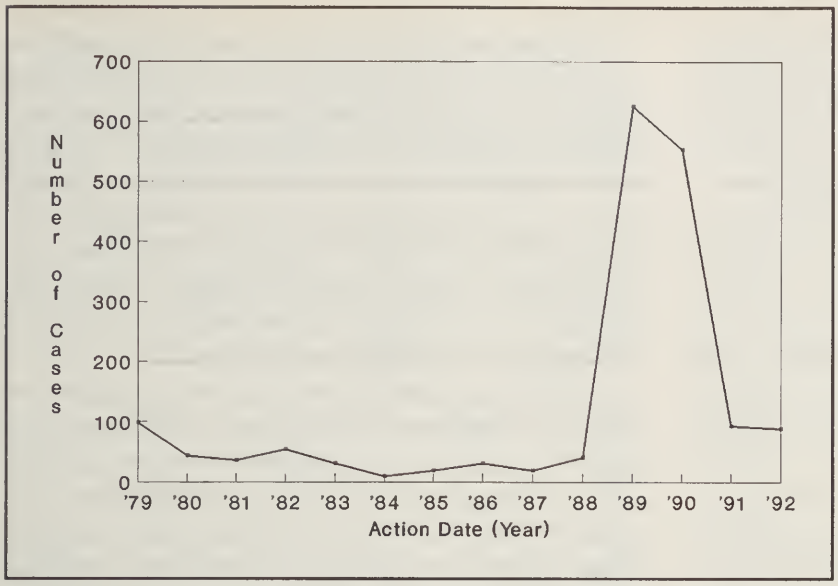

Figure 1. Number of cases of hepatitis A by action date (years).

The cases were geographically clustered in the southwest portion of the city (**Figure 4**). Almost two-thirds (61%) of the cases occurred within 5 of Baltimore's 23 zip code regions, and 30 or more cases were reported from each of these 5 regions.

Fifty-seven percent of cases (343) were located for a more extensive follow-up interview (**Table 1**). There were no significant differences between those located and those not located with regard to race or sex. The proportion of children (< 18 years of age) or their informants was significantly greater, however, among those located vs those not located (28% vs 15%, $p < .001$). A significantly higher proportion of those located resided in the zip code areas from which 30 or more cases were reported ($p = .002$).

Among the 343 cases located for interviews (**Table 2**), 59 (17%) reported household contact with a child under two years of age. No day-care centers were identified as sites where infection occurred.

Although most cases reported good hygiene practices, the opposite was noted in field investigations. For example, diaper changing on food preparation areas and inadequate hand-washing practices were described by some cases in response to directed questions regarding hygiene; conditions of crowding and poor hygiene were noted during home visits by investigators.

One hundred and five (43%) of the 242 adult cases (31% of all interviewed cases) admitted to drug use, with cocaine being the most common substance used. Forty-four percent of adults interviewed were not employed (i.e., unemployed, not currently seeking employment, or homemakers), and 2% were retired. Seven percent were food handlers. Three cases (1%) were health care providers with direct patient contact.

Only one food-borne outbreak was identified, which accounted for five cases. The food handlers who served as the source of this outbreak had not been diagnosed as having hepatitis A and, therefore, were unreported cases prior to recognition of hepatitis A in patrons.

Among the 198 cases for whom we had information on treatment-seeking delay, approximately 30% waited more than seven days after onset of symptoms to seek medical care. Among the 41 cases reviewed for reporting-delays, 36 had information sufficient for evaluation. The median delay between symptom onset and physician visit was 7 days (range 0 to 19). The median delay between physician visit to receipt of first report (either laboratory or physician report) at the BCHD was 6.5 days (range 0 to 33). Nine of the 36 cases (25%) were not able to be located for interview. Of the remaining 27 cases, the delay between the receipt of report and locating was a median of 8 days (range 1 to 42). Overall, only 1 out of 36 (3%) was reported within seven days of onset, and 17 (47%) were reported between 7 and 14 days of symptom onset. The remaining 50% were reported more than 14 days after symptom onset. None of the 36 were located within 14 days of onset for interviews and Ig administration to contacts. Twenty percent of sera in the blinded seroprevalence survey for HAV IgG antibody in young adults attending the STD clinic demonstrated immunity to hepatitis A virus.

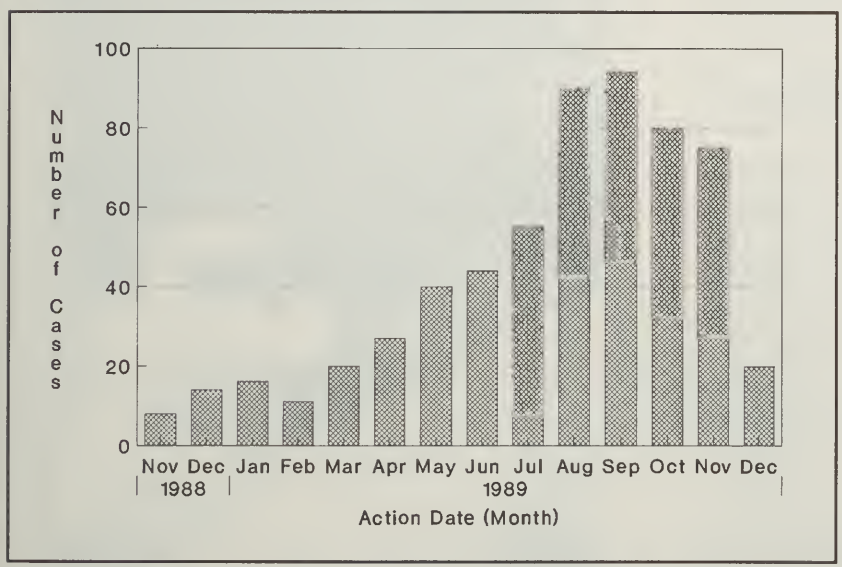

Figure 2. Number of cases of hepatitis A by action date (months). An additional 39 cases with action date in December 1989 were reported in 1990 and not included in this analysis.

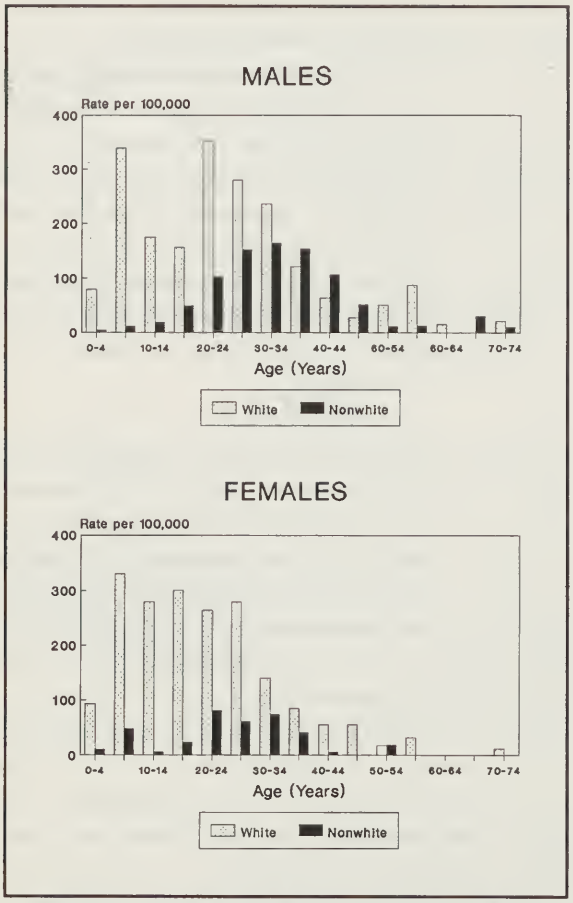

Figure 3. Hepatitis A infection rates per 100,000 by age, race, and sex.

Discussion

Baltimore experienced a hepatitis A epidemic unparalleled in the past 15 years (**Figure 1**). In the epidemic's early stages, neighborhood clusters were evident, and HAV transmission in these areas remained high despite active case investigation, education, and attempts at timely Ig administration. This epidemic affected many young adults and children and was without a clearly identifiable source.

Serologic studies of antibody to hepatitis A antigen indicate that antibody prevalence increases with decreasing socioeconomic status (SES).[3,12-13] SES indicators may serve as a proxy for other, unidentified factors that promote hepatitis A infection, such as household crowding or sanitary conditions. In the five zip code areas accounting for almost two-thirds of the cases, approximately 30% of residents were below the poverty level,[14] and 42% of households had an estimated 1990 income of less than $16,000.[15] These data are comparable with other zip code areas of the city, however, and suggest that SES status alone does not explain why the epidemic occurred in certain city areas and not others. Poor hygiene has been associated with hepatitis A infection[12-13] and may have played a role in this epidemic.

Thirty-one percent of interviewed cases reported drug use. This proportion is higher than that seen in national samples of hepatitis A cases; 14% of cases reported to the Viral Hepatitis Surveillance Program in 1987 reported drug use.[1] County-based outbreak data, however, indicate proportions of drug users that are comparable to that seen in Baltimore. For example, 28% to 58% of cases were drug users in four hepatitis A outbreaks in upstate New York counties. Drug users comprised 34% of hepatitis A cases identified in a northern California county during the first half of 1987.[4]

A causal relationship between drug use and hepatitis A cannot be established in the epidemic described here; neighborhood controls were not interviewed to determine drug use levels in the community, and it is possible that the large number of drug users in this epidemic reflects the high number of drug users in Baltimore. Baltimore City comprises 17% of the state population, yet accounts for 37% of the state total of drug users in treatment.[16] Active investigation and identification of outbreaks where drug use involvement is suspected has been recommended by the Centers for Disease Control and Prevention. This segment of the population may be unresponsive to currently available education and prevention efforts, and thus may be candidates for HAV vaccines that are under development.[4]

The 20% HAV seroprevalence seen in the predominantly heterosexual clients[17] of a Baltimore STD clinic is surprisingly high given the low level of hepatitis A reported in Baltimore

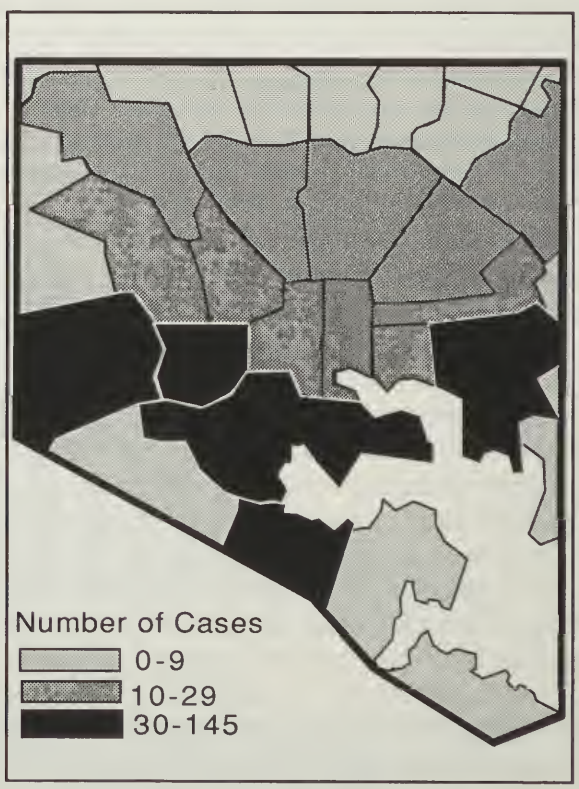

Figure 4. Hepatitis A cases by zip code area.

over the past 12 years. In a survey of 157 men attending a Seattle STD clinic, 12% of heterosexual and 30% of homosexual men were immune to hepatitis A.[18] Nonetheless, the fact that 80% of Baltimore STD clinic clients had not acquired immunity to hepatitis A indicates a large susceptible population of young adults.

Ig administration to contacts within two weeks of exposure has been recommended to protect against clinical illness.[9] Due to the fact that almost half the cases could not be located, however, this recommendation was difficult to implement. To maximize the number of cases located in an outbreak as extensive as this, it is imperative that adequate field staff devoted to ongoing investigation of cases and the resulting cluster associations are available.

Delays in seeking treatment and reporting, and delays in locating or inability to locate cases for interview created problems in the timely use of Ig as a control strategy. To expedite effective administration of Ig prophylactically, we suggest the following: (1) administer Ig to contacts during field investigations and encourage physicians in the community to give Ig to contacts when the cases seek treatment; (2) establish temporary, community-based health centers where Ig shots may be easily obtained; and (3) stress the importance of timely reporting by physicians and laboratories to the health department. In a survey by the Vermont Department of Health on communicable-disease reporting, common reasons for noncompliance in reporting were the assumption by the physician that the laboratory had reported the case of hepatitis or a lack of knowledge by physicians of reporting requirements.[19] Therefore, we suggest providing in-service training to laboratories and physicians regarding how to report cases of hepatitis A and how to refer contacts to the health department for administration of Ig.

Immunoglobulin prophylaxis has not been found to prevent sustained transmission in other community outbreaks,[12] but has been successful in the control of smaller outbreaks.[20] When it became evident that control measures to stop secondary spread were not effective in halting the epidemic, the BCHD began to provide Ig shots for contacts up to four weeks past exposure in an effort to stop tertiary spread and decrease clinical symptoms. We were unable to document the benefit of this action. The outbreak continued in 1990 with a mean of 44 cases per month (range 11 to 82). With no change in control strategies or reporting, however, the number of cases dropped to a mean of 8 cases per month (range 5 to 13) during the period January through September 1991, and remained at baseline throughout 1992.

Behavioral risk factors such as poor hygiene and drug use are difficult to change fast enough to stop viral spread in an epidemic as extensive as that experienced in Baltimore. Intensive case investigation, contact elicitation, and a liberal policy of Ig administration may be successful in preventing secondary cases. To control an epidemic of this size requires a sense of urgency in the community that includes participation by the medical community and citizens of the city. Activation of community groups and media presentations are both quick and cost-effective ways to disseminate information.

Table 1. Demographic characteristics of hepatitis A cases by locate-for-interview status

	Locate (N=343) N (%)	Non-locate (N=264) N (%)
Sex		
Male	187 (54)	158 (60)
Female	156 (46)	106 (40)

Infection in major sickle hemoglobinopathies: Should management strategies change?

Debra Freeman, M.D.; Ruth E. Luddy, M.D.; and Allen D. Schwartz, M.D.

From Sinai Hospital of Baltimore where Dr. Freeman is a resident in pediatrics, Dr. Luddy is a pediatrician in the Division of Pediatric Hematology/Oncology, and Dr. Schwartz is chairperson of the Department of Pediatrics.

ABSTRACT: *Four children with major sickle hemoglobinopathies developed severe pneumococcal infection. Three had sickle cell hemoglobin C (Hb SC) disease and one had sickle cell anemia (Hb SS). In three instances, there was a fatal outcome. The authors' experience with these cases leads them to question whether any patient with a major sickle hemoglobinopathy should be excluded from receiving prophylactic penicillin or if outpatient management with long-acting cephalosporin treatment in the sickle cell patient with suspected sepsis is appropriate therapy.*

Young children with sickle cell anemia are at high risk for developing overwhelming infection with encapsulated bacteria. Strategies to address this problem have included prophylactic penicillin, polyvalent vaccine against the more common pneumococcal subtypes, and *Hemophilus influenzae,* type b (Hib) vaccine. Protocols requiring prompt evaluation, empiric use of intravenous antibiotics, and mandatory hospitalization of children with sickle cell disease and high fevers have been used in a number of centers.

Some institutions, however, do not use prophylactic penicillin in all patients with major sickle hemoglobinopathies, and it remains unclear at what age it is safe to discontinue its use. In addition, the use of cephalosporin with a long half-life has promoted some institutions to change policies by emphasizing outpatient management on selected patients as opposed to routine admissions. Because of our experience with the subjects of this report, we question the safety of discontinuing prophylaxis and changing management strategies for suspected sepsis.

Case reports

Case 1. An 11-year-old African-American boy with sickle cell hemoglobin C (Hb SC) disease was transferred to Sinai Hospital with fever and vomiting. His past medical history was significant for pneumococcal meningitis at 2 years of age, with residual profound bilateral sensorineural deafness. He had received *H. influenzae*, type b (Hib) vaccine, but had never taken prophylactic penicillin nor received pneumococcal vaccine. He had been successfully treated as an outpatient for all occasional pain crises.

One day prior to admission, he developed a sore throat and right knee pain. On the day of admission, he vomited several times at school—a special institution for the hearing impaired. He had a fever unresponsive to acetaminophen, and his right knee pain had increased in severity. He was taken to a community hospital emergency room. His temperature was 104.6° F, pulse was 138/min, respirations were 16/min, and blood pressure was 103/58mm Hg. He was alert and cooperative, and his physical examination was reported to be unremarkable except for a tender right knee.

A complete blood count (CBC) revealed a hemoglobin (Hgb) of 10.7 gm/dl, hematocrit (Hct) of 29.9%, and a white blood count (WBC) of 11,500/mm^3 with 63% neutrophils, 28% bands, 8% lymphocytes, and a normal platelet count. A chest x-ray, serum electrolytes, blood urea nitrogen (BUN), and glucose were normal. He was treated with oxygen and acetaminophen. Blood, urine, and throat cultures were obtained, and intravenous fluids were begun. He received one dose of ceftriaxone intravenously and was transferred to Sinai Hospital for admission.

On arrival he was alert—smiling and joking via an interpreter who came with him because of his deafness. His temperature was 39°C. His knee pain had resolved, and he was able to walk without difficulty. Shortly after admission, he received a second intravenous dose of ceftriaxone. Four hours after admission, his temperature was 36.9°C. Six hours after admission, he had an emesis episode and soiled his bed with loose stool. At 7.5 hours after admission, he again soiled his bed with stool and was placed in adult incontinent briefs at which time he became agitated and combative. After being given paper and pencil to write a message, he started to write but then threw his paper away. His actions were thought to be due to a communication problem because of his deafness. He was placed in soft restraints. Approximately 2 hours later, which was 10 hours after admission, he was found unresponsive. Resuscitation attempts were unsuccessful. All blood cultures drawn prior to antibiotic administration were reported the following morning to be positive for *Streptococcus pneumoniae.*

Postmortem examination revealed congestion and edema of the right upper lobe of the lung, thought to be compatible with an early bronchopneumonia. There were small pericardial and pleural effusions and a number of gallstones, but no evidence of biliary tract obstruction. The spleen weighed 7 grams and had multiple small infarcts. There was no evidence of meningitis.

Case 2. This young adult was diagnosed as having sickle cell anemia (Hb SS) at age 6 months. Between 2.5 and 17 years of age, he had seven episodes of chest syndrome (an x-ray with changes in the lung field). He was treated for pneumococcal meningitis at age 3, bilateral aseptic necrosis of the femoral heads at age 8, and staphylococcal osteomyelitis at age 11 years.

He had experienced multiple vaso-occlusive crises. At 3 years of age, penicillin prophylaxis was begun. At age 9, he received pneumococcal vaccine, and at age 14, he received Hib vaccine. He was seen regularly at the pediatric hematology clinic. At age 19, he was transferred to the adult medical service. Shortly thereafter, he stopped taking prophylactic penicillin.

At 21 years of age, he sought medical attention at a community hospital because of fever, headache, and shortness of breath. He was alert and was complaining of pain in his abdomen and hips. His Hgb was 9.0 gm/dl, WBC was 18,400/mm^3 with 42% neutrophils and 39% bands, and platelets were adequate on smear. A pulmonary infiltrate was seen on chest x-ray. He began to pass bloody urine and told his mother he was going to die. He developed increasing shortness of breath, had a cardiac arrest, and could not be resuscitated. Postmortem examination and premortem blood cultures drawn in the emergency room indicated that death was due to overwhelming infection with *S. pneumoniae*.

Case 3. This patient was diagnosed as having Hb SC disease at age 4 1/2. He did not receive prophylactic penicillin. At age 5 1/2 he was diagnosed as having meningitis and chest syndrome. *S. pneumoniae* grew from blood and spinal fluid. He was treated successfully and experienced full recovery. Polyvalent pneumococcal vaccine was given at age 11. He has been lost to follow-up.

Case 4. An 8-month-old female sibling of Case 3 arrived at the University of Maryland Pediatric Emergency Room dead on arrival. Autopsy findings and postmortem cultures indicated that death was due to *S. pneumoniae* meningitis. Blood for hemoglobin electrophoresis had been drawn at a well-baby clinic visit two weeks before demise. The results, unknown at the time of death, showed the infant had Hb SC disease. This child had been reported previously,[1] before the era of widespread newborn screening and prophylactic penicillin.

Discussion

It is presently well accepted that infants and young children with sickle cell anemia are at increased risk for developing severe bacterial infection, most frequently with *S. pneumoniae* or *H. influenzae*, type b. It is believed that the major reason for this susceptibility is the functional asplenia that occurs in these

children at a very early age. The conclusion from a multicenter study was that children should be screened in the neonatal period, and those with sickle cell anemia should receive prophylactic oral penicillin to decrease morbidity and mortality associated with pneumococcal septicemia.[2]

Although penicillin prophylaxis has become part of standard care for children with SS anemia during the first five years of life,[3] there is no general agreement as to the safe age for discontinuing penicillin. Zarkowsky et al,[4] using data collected from 23 clinical centers participating in the Cooperative Study of Sickle Cell Disease, calculated age-specific bacteremia incidence rates and concluded that the incidence rate was highest among children with Hb SS and Hb SC disease under 2 years of age. Children with SC disease had an abrupt decrease in the incidence rate after age 2, while those with Hb SS disease had a gradual decline in the incidence rate from 2 to 6 years of age.

The great majority of reports emphasize the young age of the children experiencing overwhelming infection. Of the 15 cases of pneumococcal infections in Hb SS patients reported by Barrett-Connor, only one was older than 5 years of age—an 11-year-old male with meningitis.[5] Similarly, the 16 children with meningitis reported by Robinson and Watson[6] included no child who had reached the sixth year of life. Griesemer et al,[1] however, noted in their report of 19 patients with a major sickle hemoglobinopathy and pneumococcal meningitis that 4 were older patients (ages 9, 12, 17, and 21).

Adults ranging in age from 18 to 34 years with major sickle hemoglobinopathies have developed pneumococcal sepsis and meningitis, frequently resulting in a fatal outcome.[1,7,9] A number of older children and adults with no underlying disease have developed severe infection many years after splenectomy following abdominal trauma,[10–12] indicating that age alone does not confer immunity.

Rogers et al,[13] in a recent publication, stated that "children with sickle cell hemoglobin C disease or sickle cell B^+ thalassemia may not be at greatly increased risk of septicemia." Their center, therefore, neither uses prophylactic penicillin nor treats these patients presumptively for occult bacteremia. A number of children with Hb SC disease, however, have been reported to have *S. pneumoniae* septicemia.[1,4,8,14–19] In addition to the two fatal cases in this report, other fatalities have been noted in the literature.[1,8,17]

Because of the young sickle cell patient's susceptibility to overwhelming bacterial infection, some centers have developed protocols that require immediate evaluation and treatment.[13,20] Such approaches often lead to hospitalization in order to administer the intravenous antibiotics necessary to maintain therapeutic blood levels in the child at risk. The great majority of children, however, have negative blood cultures. The cost of frequent hospitalizations and the availability of long-acting antibiotics providing excellent coverage against *H. influenzae*, type b and *S. pneumoniae* have prompted at least one group to propose outpatient management.[13]

Our present policy is to prescribe prophylactic penicillin to all patients with major sickle hemoglobinopathies, regardless of age, because older patients with Hb SS disease and those with Hb SC disease, although at lower risk than young children with Hb SS disease, still experience overwhelming infections. Management of suspected infection in children with sickle hemoglobinopathies, however, remains problematic. Physicians with experience in treating this disorder rely on the patient's age, height of fever, knowledge of the family, and clinical judgment to determine which patients are admitted to the hospital and which are treated as outpatients.

We believe that, at the present time, the number of children reported to have been successfully treated with outpatient protocols who are discovered to have bacteremia remains too small to make recommendations on management. Unfortunately, as so graphically demonstrated by Case 1, even children with mild Hb SC disease who are at an age when the incidence of sepsis is low, may experience a devastating outcome despite prompt antibiotic therapy.

Commentary on infection in major hemoglobinopathies

The report by Freeman et al points up four unresolved questions in the treatment of children with hemoglobinopathies:

1. How can we get patients with sickle cell disease (sickle cell anemia [SS], sickle beta°-thalassemia, sickle beta⁺-thalassemia [S/beta⁺-thal], hemoglobin SC disease [SC], hemoglobin S-O_{arab} disease), diagnosed at birth in Maryland, into the health care system?
2. Which patients with sickle cell disease should be treated with prophylactic penicillin?
3. When should prophylaxis be stopped?
4. How should febrile episodes be managed in children with sickle cell disease?

My comments should be taken as those of an interested bystander. I am not a pediatrician, but I have watched the penicillin–prophylaxis story unfold, and I did participate in the development of a recent Department of Health and Human Services clinical practice guideline.[1] Free copies of this consensus document are available by calling 800-358-9295, but answers to the questions posed by Freeman et al will not be found there.

All parents of newborns in Maryland are offered a screening test for sickle cell disease at the same time that the newborns are screened for metabolic disorders. Repeat testing after high neonatal levels of fetal hemoglobin have decreased is required to confirm the diagnosis. Intensive efforts are made to get all patients whose results might indicate sickle cell disease into medical follow-up. That is far from easy.[2] It has required devoted effort by the staff of the Hemoglobinopathies Screening and Follow-up Program coordinated by the Maryland Department of Health and Mental Hygiene (DHMH). All children with sickle cell disease identified by the program are assisted in obtaining medical care. The patient described by Freeman et al in Case 4 died long before the program was established; since 1985 not one child entered into the program is known to have died. There is a very low documented incidence, less than 2%, of serious bacterial infections in the 463 patients with sickle cell disease followed by the program from birth to age 3. That record can only be continued with the active and enthusiastic participation of health professionals throughout the state. The paper by Freeman et al certainly makes one wonder what happens to the SC and S/beta⁺-thal children in other states who are not entered into programs like the one in Maryland, and are not necessarily given penicillin, and are not followed prospectively.

The guideline referred to above is silent on penicillin administration to S/beta⁺-thal and SC children because there is no consensus on the point. These conditions are milder disorders, splenic function continues longer than in sickle cell anemia or sickle beta°-thalassemia, and the risk of early mortality is lower. As Freeman et al point out, the risk is not zero.

In my own mind, the cumulative risk of administering pneumococcal vaccine and penicillin to all young SC and S/beta⁺-thal patients is smaller than the risk of overwhelming sepsis in a few of them; I have no argument with the authors on their recommendation. Some clinicians would restrict antibiotic prophylaxis to those children in whom splenic dysfunction can be demonstrated[3]; that is fine if your hospital laboratory can look for pocked red cells (a sign of a nonfunctioning spleen), but most cannot.

Stopping prophylaxis is the subject of a current National Heart, Lung, and Blood Institute (NHLBI) study, PROPS II (Prophylaxis Penicillin Study II), that asks whether prophylaxis is beneficial after the age of 5, and whether continuing it interferes with immunity to pneumococcal infection or is associated with emergence of penicillin-resistant organisms. That study has another year to go before we get an answer; my own experience is that overwhelming sepsis in patients 17 years of age, as in the patient described in Case 2, is most unusual. I would probably stop the drug around age 7 if I knew that a booster of pneumococcal vaccine had actually been administered. As with all aspects of medicine, treatment must be individualized; although I would probably be more conservative with a child who had had as much trouble as the young man described in Case 2, I would have stopped treatment at age 19, as his physician did, even with the advantage of hindsight.

Treatment of acute febrile illness in children with sickle cell disease is controversial. Empiric use of ceftriaxone in a febrile SS child, with outpatient follow-up, is not unreasonable. It saves money, parents like it, and it has worked in the hands of experienced clinicians.[4,5] Ceftriaxone does not work as well as penicillin for pneumococcal infection, but the patient described in Case 1 could have been infected with *H. influenzae*, and he was not treated as an outpatient. Would knowledge that he had never received pneumococcal vaccine have made a difference in that choice? Maybe, but the real lesson to be learned from this patient is that a fever in any child with any form of sickle cell disease must be treated with great concern, and outpatient follow-up carries a definite, if small, risk.

The role of ultrasound in prostate cancer detection in patients with an elevated prostate specific antigen level but no prostatic nodule.

Roger C. Sanders, M.D.

Dr. Sanders is medical director of the Ultrasound Institute of Baltimore, and a clinical professor of radiology, obstetrics and gynecology at the University of Maryland.

ABSTRACT: *An increased level of prostate specific antigen (PSA) in the blood is a relatively sensitive indicator of prostate disease; a significant minority of men with increased PSA will have prostate carcinoma. A total of 736 men with a PSA elevation of greater than 4.2 without a rectally palpable prostate mass were evaluated with transrectal ultrasound at the Ultrasound Institute of Baltimore over a three-year period. Transrectal biopsy under ultrasound control was performed when a localized mass was seen on ultrasound or the prostate was small and the PSA level significantly elevated (93% of the series underwent biopsy). There was a positive biopsy yield for cancer of 38.5% in the cases biopsied. This high positive yield was achieved by combining high quality ultrasound with two to three samples from a visible mass and random samples from other sites.*

Prostate cancer is the most prevalent cancer in the world. It is the most frequently diagnosed cancer in men in the United States and the second most lethal. There are 135,000 new cases and 32,000 deaths each year in the United States from prostate cancer. Clinically evident cancer will develop in approximately 10% of the male population, and there is a 3% chance of dying from prostate cancer.[1] Early detection can be helpful in reducing mortality from prostate cancer. Approximately 80% of prostate cancers can be seen with transrectal ultrasound although about 20% do not cause a visual change at sonography.[2] Most prostate cancers (75%-80%) occur in the prostate's peripheral zone where the normal sonographic appearance is homogeneous. The remainder lie in the central or transitional zones, which have a varied sonographic texture so that cancers may not be distinguished from the benign prostatic hypertrophy that normally occurs in these areas. At the Ultrasound Institute of Baltimore, over 700 patients with an elevated

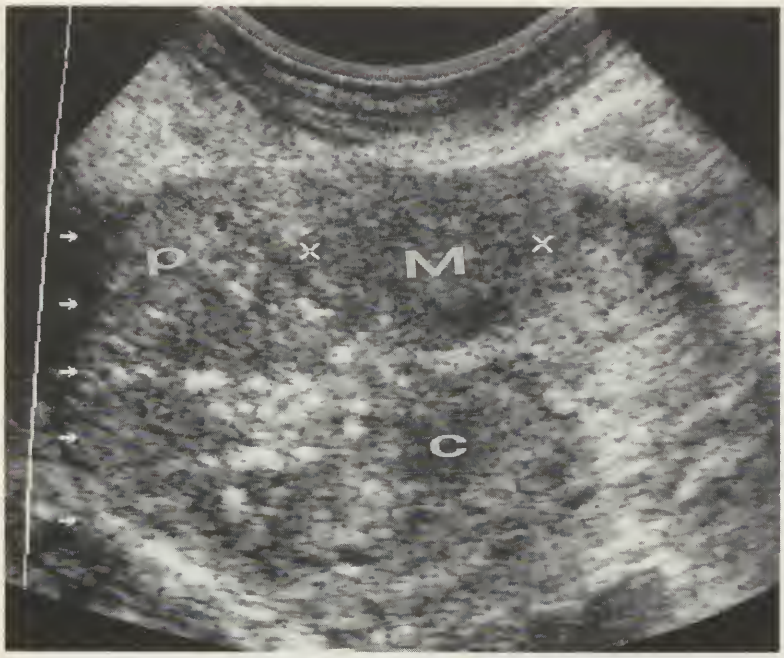

Figure 1. Transverse view of a transrectal sonogram in a patient with a carcinoma of the prostate. The prostate cancer is seen as an echopenic mass (M) in the peripheral zone (P). Note the inhomogeneous central area (C).

prostate specific antigen (PSA) level but without a mass on digital rectal examination have been referred in the last three years from urologists and internists. Sonographic and biopsy results with this large series will be discussed.

Materials and methods

Between November 1989 and July 1992, 736 men underwent transrectal ultrasound of the prostate because of an elevated PSA level without a rectally palpable mass. All patients underwent transrectal ultrasound examination with acoustic imaging 7.5 Mhz transrectal ultrasound probes. The results were interpreted at the time of the study, noting the presence of discrete or ill- defined hypoechoic masses in the peripheral zone (**Figure 1**). The following features of the masses were noted: (1) size; (2) location (masses at the base are more likely to involve the seminal vesicles, which make the lesion nonoperable); and (3) evidence of capsular invasion (capsules bulge or are irregular at an invasion site). The central and transitional zones were examined, and a few masses were noted in these less sonographically homogeneous areas.

Sonogram findings were discussed with the patient and family, and a mutual decision was made to perform a biopsy in 690 patients. Patients were premedicated with antibiotics on arrival—usually 250 mg or 500 mg of ciprofloxacin (unless contraindicated, when another antibiotic was substituted). This antibiotic has a peak blood level about two hours after administration. Antibiotic coverage was extended for 36–72 hours after the procedure. Initially, men were given 10 mg of Valium (diazepam) or 30 mg of Demerol (meperidine) for anxiety and rectal pain, but this regime was abandoned when it became clear it promoted hypotension. About 20 men with excessive pain sensitivity were given 500 mg/c of alfentanil intravenously prior to the biopsy. This drug renders the patient pain free for about 10 minutes. These patients were monitored with a pulse oximeter since there is small risk of hypoxemia.

Biopsies were obtained with an 18-gauge Biopty gun apparatus (manufactured by C.R. Bard, Inc., Bard Urological Division) attached to the endorectal probe. Six to 10 specimens were obtained in each patient, with an average of 8 specimens per patient. Specimens were sent in fixative to the pathology laboratory on the day of the biopsy. All patients were observed after the procedure for 20 to 45 minutes.

Five patients were hospitalized. Two patients had hypotensive episodes shortly following the procedure. A man with cardiac problems was hypotensive for about 30 minutes. He was released from the hospital the next day. A second patient had a severe hypotensive episode 45 minutes after leaving the institute but was released after overnight observation. These episodes occurred while we were still giving Demerol and Valium.

Three patients were admitted to the hospital with septicemia between four and seven days after the procedure; the septicemia responded rapidly to intravenous antibiotics. There were no episodes of bleeding requiring blood transfusion or hospital-

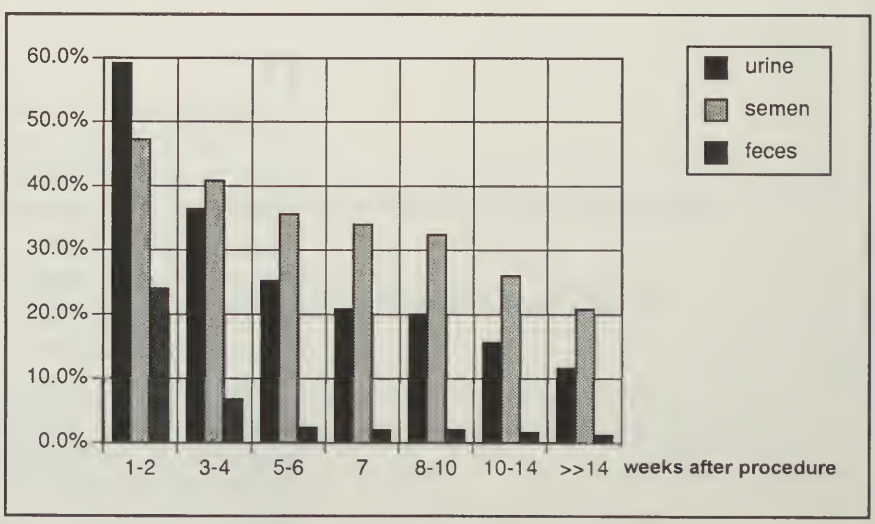

Figure 2. Bloodstaining, as reported by patients.

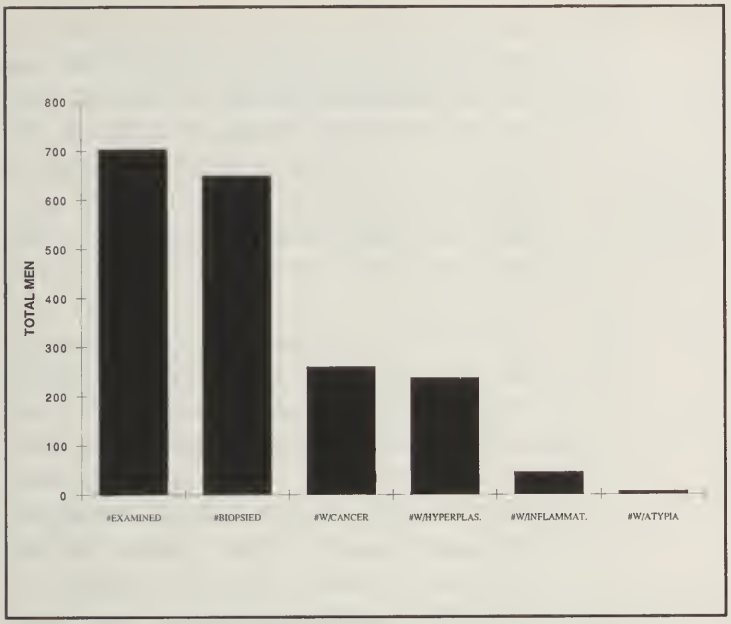

Figure 3. A total of 736 men were referred due to a PSA level greater than 4.2 but without a rectally palpable prostate mass.

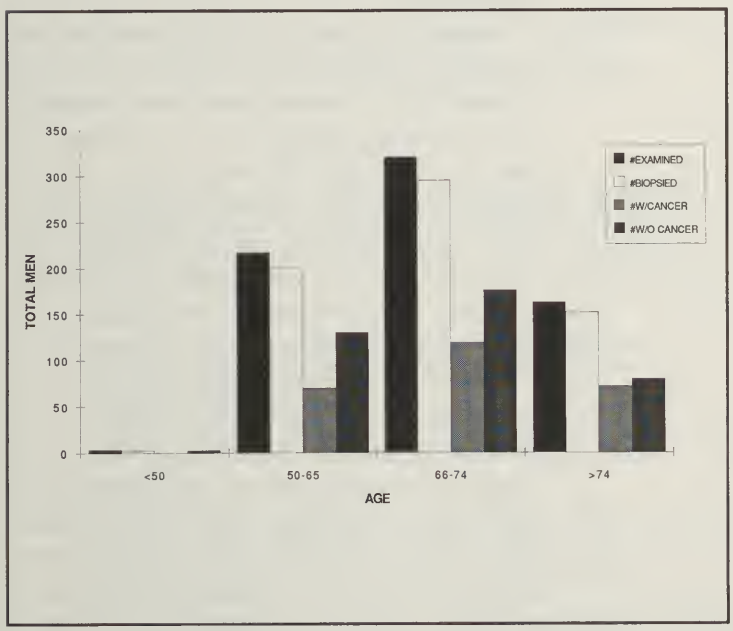

Figure 4. Biopsy results in men referred due to a PSA level greater than 4.2.

ization. A total of 270 patients were sent a questionnaire three weeks after the procedure to assess whether they had side effects. Sixty percent of the patients reported bloodstaining of the urine, which lasted longer than a week in 20%. Forty-seven percent reported some bloodstaining of the sperm, which persisted in 32% beyond a week. In all instances, the quantity of blood was small (**Figure 2**).

Results

A total of 736 men with an elevated PSA level greater than 4.2 but without a rectally palpable prostate mass were evaluated with transrectal ultrasound at the Ultrasound Institute of Baltimore over a three-year period. There was a positive biopsy yield for cancer in 270 patients (37%) or 39% of the cases biopsied, (**Figure 3**). Of those patients biopsied, 216 were 40–65 years of age, 339 were 66–74, and 135 were over 74 (**Figure 4**).

Cancer detection rates were similar in those 50–65 and 66–75 years of age, but greater in the over 75 years of age group. As expected, the positive biopsy rate increased as the PSA and PSA density (PSAD) levels increased (**Figures 5 and 6**). With a PSA level of 15 or more, most patients had cancer. All patients with a PSA level greater than 25 had cancer or recent acute prostatitis. All but two patients with a PSAD level greater than .4 had cancer (**Figure 6**). Most patients with visible masses but negative biopsies had foci of benign prostatic hyperplasia (BPH) in the peripheral zone (254). Twenty-three had prostatitis and five had prostate intraepithelial neoplasia (PIN). As expected, there was a correlation between the PSA level and cancer. At all PSA levels above 4.2, the chance of cancer was greater than one in five (**Figure 5**).

The prostate size can be related to the PSA level by the formula: PSA divided by the volume of the prostate. This formula gives a value known as the PSAD. Volume can be estimated with transrectal ultrasound (TRUS), using the formula for a prolate ellipse. The length, width, and height of the prostate are multiplied together, and the sum is divided in half. PSAD estimation was helpful in deciding whether a biopsy should be performed (**Figure 6**). If the PSAD was less than .15 and no focal lesion was identified, a biopsy was not performed. All specimens were given a Gleason grade at pathology. The Gleason grade is a pathological method of grading the severity of the cancer based on the appearance of the cells and the extent of the tumor. Most were Gleason grades of 5, 6, or 7.

Discussion

Almost all men with early prostate cancer have no symptoms. Frequent voiding or poor stream do not relate to prostate cancer but to benign prostatic hypertrophy (BPH). Seventy-five to eighty percent of prostate cancers occur in the periphery of the gland away from the peri-urethral area where benign gland hypertrophy causes urinary symptoms.

The level of PSA, a glycoprotein produced only by the prostate, was the determinate used for a number of years in patients with prostate cancer to see if cancer had recurred. It has recently been realized that PSA elevation can be used as a tool for detecting cancer before it is metastatic.[1] Most agree that screening with PSA estimation should begin at age 50 since prostate cancer incidence rises after that age. Among our patients, 27.5% were between ages 50 and 75. PSA estimation at an earlier age may be desirable in those with a family history

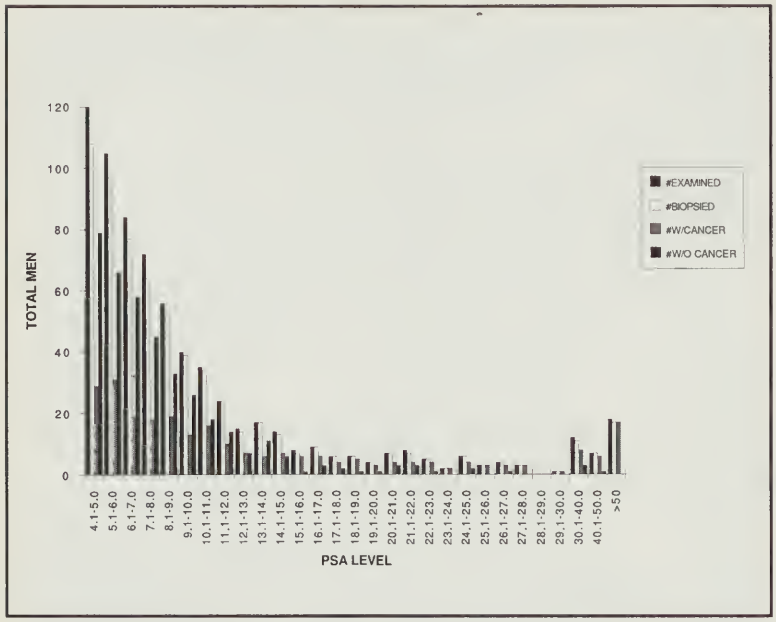

Figure 5. PSA level vs biopsy results in men referred for increased PSA.

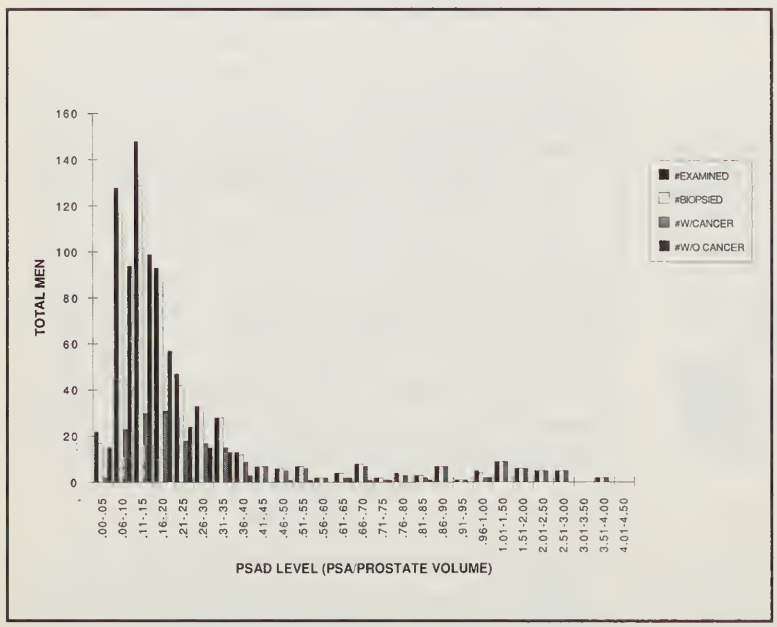

Figure 6. PSAD level vs biopsy results in men referred for increased PSA.

of prostate cancer, in African Americans, and in men with hematospermia.

PSA elevation is not specific for cancer. Other prostate abnormalities that increase the PSA level include BPH, acute and chronic prostatitis, PIN, and digital palpation. BPH is thought to increase PSA by only 0.3 ng/ml per gram of prostate tissue. A value of less than 4.0 ng/ml is often considered the top of the normal range, 4–10 is indeterminate, and greater than 10 is associated with a high likelihood of cancer.

Patients in this series all had a PSA level greater than 4.2 ng/ml. We related the PSA level to the volume of the prostate, deriving the PSAD.[4] We used the PSAD as a guide to determine whether to biopsy if no focal lesion was seen with ultrasound. Initially, a value of .25 was used as the cutoff rate for biopsy in the absence of a focal mass, but with time and the minimal complication rate, we lowered the biopsy threshold in the absence of a focal mass to .15 and later to .10. The cancer rate rose from 35% to 39% when we made this change.

In our view, ultrasound is an essential management component when an increased PSA level is discovered. Only a minority of patients with cancer have a digitally palpable mass.[2] Some patients with increased prostate size, a relatively low PSA level (below 10), and no visible mass on ultrasound may not require biopsy if the PSAD is below .10. The yield with ultrasound- guided biopsy is higher than with digitally guided biopsy.[5] Suspect masses can be targeted easily, and random biopsies of other sites can be located accurately so that all prostate regions are biopsied.

Hypoechoic lesions in the peripheral zone are considered highly likely to be cancer, but may represent BPH.[2] Our study shows that one-third of these hypoechoic areas are cancer. Features that raise the likelihood of cancer include: irregular borders, capsule bulging, and fat disruption around the prostate. Central zone lesions are more difficult to recognize due to inhomogeneous BPH tissue in most men over 50 years of age. Some lesions start in the peripheral zone and extend into the central zone.

Approximately 80% of the positive biopsies came from suspicious areas identified by ultrasound, but others were obtained from areas with a sonographically normal appearance. Sixty percent of the ultrasonically suspicious areas did not contain cancer. We analyzed the negative mass biopsies; most were related to foci of benign prostatic hypertrophy occurring in the peripheral zone (254), a moderate number were due to prostatitis (23), and a very few to PIN (5). A few had normal glandular tissue.

Several practical problems exist in the management of an increased PSA level. What level of PSA is always cancer? In our experience, anyone with a PSA level over 25 who had not had an acute prostatitis episode had cancer.

Can one predict cancers that are incidental and that will grow so slowly they can be considered an incidental finding? Gleason- grade estimations of the cancer aggressiveness based on cell shape and tumor extent are helpful in predicting tumor aggression. The range is from 3 (very low aggression) to 9 (very high aggression). Most cancers fall in the middle range when treatment is probably worthwhile.

In patients over 75 years of age, it is helpful to look at the number of positive biopsy specimens and at the Gleason grade. If only one of the six to nine specimens is positive, a re-biopsy of the area where the cancer was found may be worthwhile to see how widespread the tumor is.

We believe these results represent the largest series of patients with increased PSA levels without palpable mass examined with transrectal ultrasound with, if necessary, biopsy. The 37% positive biopsy rate is greater than any other comparable series in the literature so far as we know. Other investigations have looked at patients from screening studies who have undergone PSA estimation, digital rectal examination, and TRUS and have reported on much smaller numbers.[6-7]

Patients in our series were referred from both urologists and internists in a 70%/30% ratio so that the quality of the rectal examination was variable. The positive biopsy rate in the two groups, however, was almost identical. Since there is such a large positive rate without a rectally palpable lesion, we believe that as soon as an elevated PSA level has been discovered and a rectal examination is negative, a TRUS with biopsy should be performed if a mass is found on ultrasound or the PSAD is elevated above .10. A digital rectal exam remains an important part of screening for prostate cancer since about 16% of cancers are palpable and yet have a normal PSA level.

Hypokalemia associated with ticarcillin–clavulanic acid

Rudolf Titanji, M.D., and Andrew Trofa M.D.

ABSTRACT: *Charts of 16 patients on ticarcillin-clavulanic acid were examined. Eight patients were found to have hypokalemia, yet not all were screened routinely for potassium imbalance. Some physicians prescribing ticarcillin-clavulanic acid seem unaware of the drug's side effect.*

From St. Agnes Hospital, where Dr. Titanji was a resident and Dr. Trofa was assistant residency program director and infectious disease specialist at the time of the study.

Ticarcillin–clavulanic acid (Timentin) and other penicillins can cause hypokalemia by behaving as nonreabsorbable anions in the distal tubules causing an increase in urinary excretion of potassium. In some patients, the hypokalemia can result in cardiac arrhythmias. We, therefore, undertook the following study to find out the extent of hypokalemia associated with ticarcillin–clavulanic acid in the Medical Service of St. Agnes Hospital in Baltimore.

Patients and methods

The study was carried out from January to June of 1990. Computer printouts of patients on ticarcillin–clavulanic acid were obtained twice a week from the Pharmacy Department. The charts of these patients were subsequently reviewed. Excluded from the study were patients on potassium supplements prior to initiation of treatment and patients with disorders that could affect potassium balance (e.g., diarrhea, renal failure, or treatment with diuretics). Laboratory parameters studied included serum sodium, blood urea nitrogen (BUN), and creatinine levels. Normal potassium levels in our laboratory were 3.5–5.6 mEq/L.

Results

Sixteen charts were reviewed. **Table 1** shows the eight patients found to have hypokalemia. Five patients had hypokalemia on the second day of treatment and two on the third day. All the patients found to have hypokalemia were given potassium supplements by residents or attending physicians.

Table 1. Potassium levels

	Days of treatment						
Patient	Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7
#1	4.1	-	3.9	3.2	3.5	-	4.1
#2	3.9	2.4	4.1	3.8	5.2	-	-
#3	3.8	4.2	2.4	2.5	2.6	3.1	3.3
#4	5.1	-	3.1	-	3.5	-	-
#5	4.3	3.2	5.0	-	4.2	-	-
#6	4.7	2.6	4.0	5.2	-	-	-
#7	3.6	3.0	-	2.4	-	3.1	4.0
#8	5.7	2.9	4.3	4.6	-	-	-

Frequently, we did not find any physician documentation on the charts stating that the hypokalemia may have been caused by ticarcillin-clavulanic acid. We found that not all patients on ticarcillin-clavulanic acid were routinely screened for potassium imbalance. There were no significant changes in the serum sodium, BUN, or creatinine levels.

Discussion

This study, along with others,[1-3] shows that ticarcillin-clavulanic acid can cause hypokalemia. This generally occurs on the second and third days of therapy. Apparently, most physicians prescribing the drug are unaware of this side effect.

Due to the small number of patients examined, this study may not accurately reflect the extent of hypokalemia encountered during therapy with ticarcillin–clavulanic acid, but it serves as a reminder to physicians to routinely check serum potassium levels in patients on ticarcillin–clavulanic acid.

Vignette of medical history: Porphyria in royalty

Joseph M. Miller, M.D.

Dr. Miller is a retired surgeon from Timonium, Maryland.

ABSTRACT: *The porphyrias are a group of uncommon inherited disorders caused by an accumulation of porphyrins in the body. This paper identifies many of the individuals in the royal houses of Stuart, Hanover, and Prussia who were afflicted with this condition, and highlights the impact this disease had on the history of England.*

Historians have often been thought to underestimate the impact of disease on history, but in many instances, a direct cause and effect state may be defined. Illness is not always the reason for change, but porphyria certainly influenced events in England and other parts of Europe.

Students of the American past will recall the description of George III of Great Britain as given in the Declaration of Independence. He was regarded as an absolute tyrant and was considered responsible for many of the ills affecting the colonies.

George was also considered "mad" during several periods of his reign, and the question of his sanity during the American Revolution has been raised. At one time, he was thought to have a manic-depressive personality, but investigative studies have produced a more reasonable and acceptable diagnosis of porphyria.[1] Further wide-ranging familial studies eventually led back to Mary Queen of Scots. [2]

The porphyrias are a group of uncommon inherited disorders caused by an accumulation of porphyrins in the body.[3] Disease transfer to progeny is by means of an autosomal dominant gene controlling porphobilinogen deaminase formation. Symptomatic and asymptomatic heterozygotes for the defect have a 50% deficiency of the enzyme. Curiously and still unexplained is that about 90% of those with documented deficiency of this enzyme remain asymptomatic throughout their lifetimes.

Individuals with latent or expressed disease may have an acute attack precipitated by any number of factors. Symptoms occur more frequently in females than in males. The disease is rare before puberty, and incidence and

severity decrease after menopause. In addition, clinical manifestations are more evident during menstruation. A great number of drugs, including the barbiturates, sulfonamide derivatives, and synthetic estrogens, may precipitate the ailment's return.

The clinical course is marked by intermittent episodes of abdominal pain and spells of psychiatric turmoil. A painful paresis of the arms and legs, visual disturbances, radicular pain, and dysfunction of the autonomic nervous system may be seen. Increased amounts of delta aminolevulinic acid and porphobilinogen (PBG) are excreted in the urine. The port wine color sometimes seen in the urine is a reflection of PBG conversion.

George III, the most well-known individual with the syndrome, had his reign punctuated by five episodes of mental illness. Some biographers thought he was courageous and steadfast, although his drive to be a potentate and exert supreme personal rule led to major political changes in Great Britain. He was plain, sound, and sincere but had little rapport with the artistic world. Religious, moral, and temperate, he and his wife led an exemplary life. His reign was the second longest in English history, although much of the time he was considered insane or on the borderline and, overall, not too bright.

The loss of the American colonial empire was a great blow to England, but King George was not in one of his mad spells when the event occurred. His last years were difficult for him and his subjects. He became blind from cataracts and later, deaf. In the years between 1788 and 1810, the king was apt to be ill at any time. His conduct was most unusual, and his doctors decided that George needed to be incarcerated for the protection of himself and others. He was subjected to a wide variety of nonspecific treatments without beneficial results.

Fifteen individuals with porphyria have been discovered in the royal houses of Stuart, Hanover, and Prussia (**Figure 1**). The more famous included Mary Queen of Scots, James I, Queen Anne, George III, and Frederick the Great. Two other afflicted people whose lineage could be traced to these royal houses have been identified in more recent times.

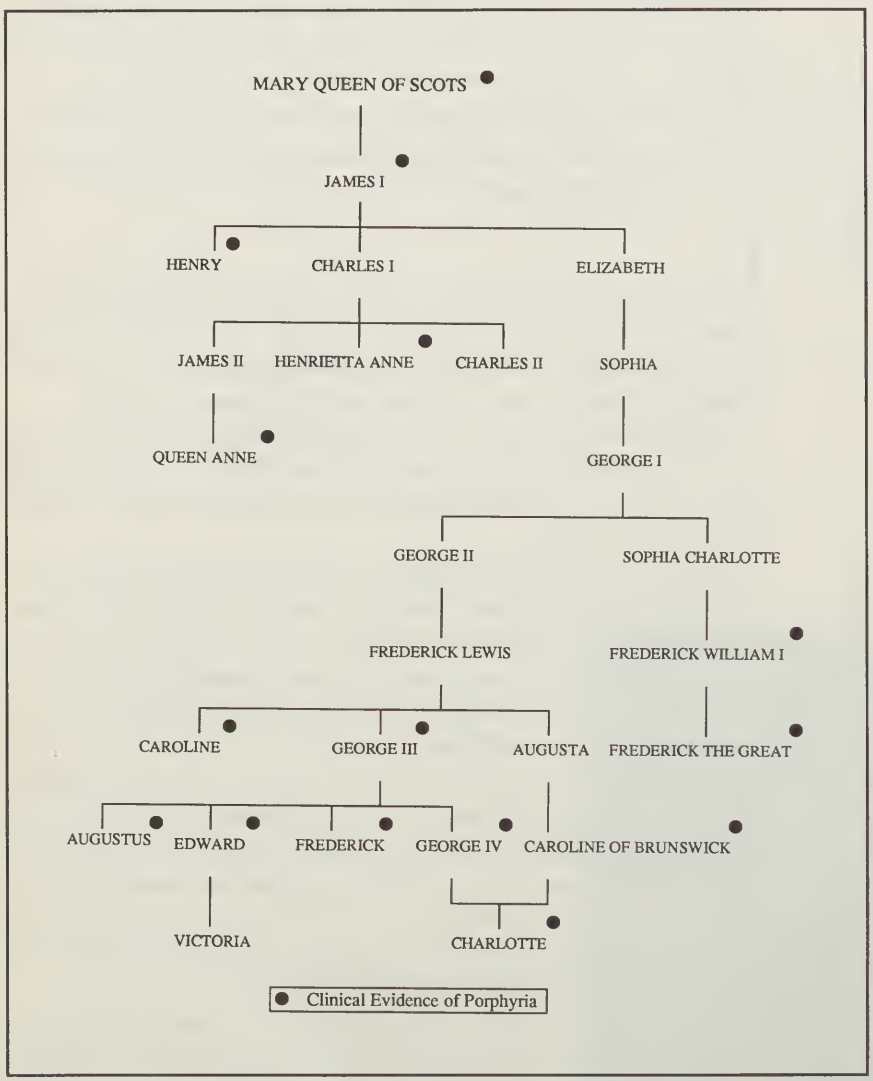

Figure 1. Members of the royal families exhibiting clinical evidence of porphyria.

Mary Queen of Scots, one of the great invalids of history, suffered repeated attacks of abdominal pain, vomiting, and mental disturbances. Often confined to bed by these episodes, she became melancholy, excitable, and distracted. Her political behavior was such that she was forced to abdicate and flee to England where Queen Elizabeth kept her as a guest and prisoner for 17 years. Convicted of treason, Mary was subsequently executed by Elizabeth.

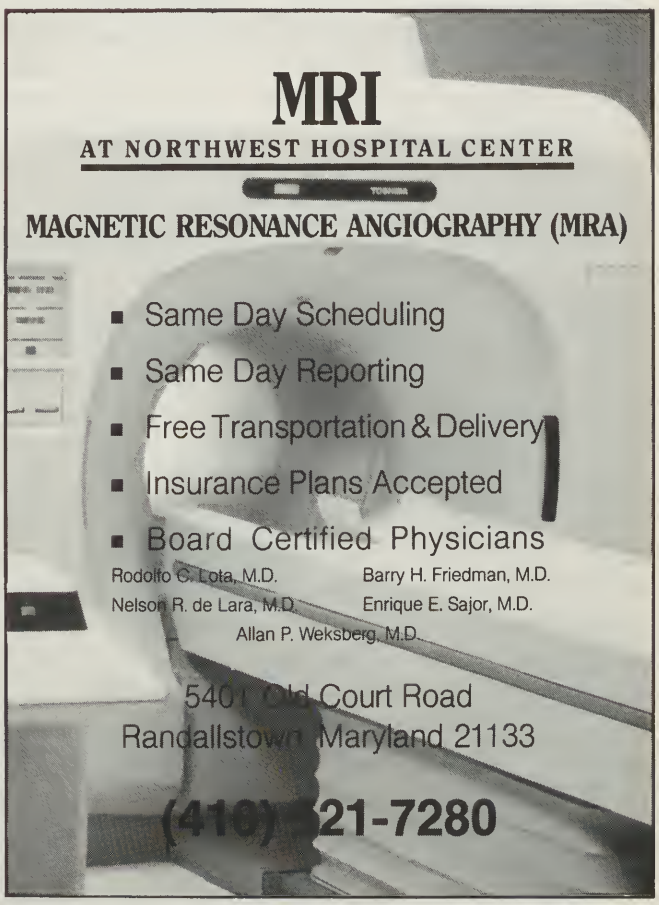
James I, the son of Mary, succeeded to the throne of Great Britain after the death of Elizabeth. He, too, had repeated attacks of porphyria. Fits of unconsciousness were accompanied by passage of bloody urine. His last illness terminated in convulsions and death.

Queen Anne, who succeeded to the throne in 1702 upon the death of William III, married Prince George of Denmark in 1683. Besides having innumerable miscarriages, Anne carried 17 children to term, but they all died quickly except a son who succumbed at 11 of a fever or smallpox.

Frederick the Great—the monarch on crutches—also suffered from porphyria. He inherited the disease from his father, Frederick William I, whose parents were first cousins and descendants of Sophia in the Hanover line. Frederick the Great had

repeated attacks of difficulty with his stomach, vomiting, colic, and constipation. At 35, he had his worst episode with a partial apoplexy.

Many times porphyria produced dramatic and unusual events in this group of royal individuals.[4,5] It mimicked poisoning on five occasions: Mary Queen of Scots in 1566; the Prince of Wales in 1612; James I in 1625; Henrietta Anne in 1670; and Caroline in 1775. Queen Anne had repeated unsuccessful pregnancies and so did not produce an heir to the throne, perhaps as a result of porphyria. This sequence of events led to the accession of the Hanovers. In the reign of George III, porphyria occasioned the regency crisis of 1788 and the eventual advent of Victoria to the throne. She became the successor because of the death of Charlotte, heiress presumptive, just after the delivery of a stillborn child as a result of the royal illness.



Only a few members of the royal society have had overt porphyria, and the numerous carriers will never be known as 90% would have been silent partners. One individual who did show the disorder was the father of Queen Victoria. She inherited the gene for hemophilia from her mother, and this in turn was passed on to members of succeeding generations. The intriguing question arises as to whether Victoria also received the porphyria gene from her father. If she did, its spread into the German house of Hohenzollern and to her grandson, William II, would have been possible.

As is evidenced by the above, disease can have a significant impact on history. Porphyria certainly had an effect on English history for centuries.

MAKE SURE YOUR LIABILITY INSURANCE ISN'T A LIABILITY

PSA Professional Liability, Inc. and our affiliate companies offer physicians, surgeons and support staff a full spectrum of professional, financial and risk management services.

Over the years, PSA has worked together with thousands of medical professionals who anticipate special problems in today's business environment. At PSA, we specialize in solving most of these before they actually become problems.

The PSA Professional Liability, Inc. staff can research area malpractice carriers and furnish you a comparative premium and benefit analysis. Additionally, there are practice discounts available to physicians and surgeons.

Because many other physicians have confidence in our service and expertise, PSA Professional Liability, Inc. is currently one of the largest Malpractice Insurance Agencies available to assist you.

Call our Resource Line for a no obligation Personal Malpractice Analysis.

WORD ROUNDS

Quatrains

The Latin word for "four" is *quattuor.* From it we derive our prescriptive *quater in die* 'four times a day' or **QID**. The **quadriceps** femoris muscle—that great friend of the professional punter—is named for its four heads (*quadri* 'four' + ceps from Latin *caput* 'head'). Of course, the **biceps** muscle has two, and the **triceps** has three heads. The word **muscle** stems from the illusion produced by contractions. To some early Romans, the ripples appeared to resemble a small mouse racing beneath the skin. (Latin *mus* 'mouse'—*musculus* 'little mouse'. The genitive "of mice" is *murinus*, which gives us the term **murine.**)

Quadriplegia (Greek *plege* 'a stroke or paralysis') and **quadripara** (Latin *parere* 'to bring forth or deliver') are self-explanatory. Unfortunately, **quadrigeminy** is flawed. It describes a cardiac arrhythmia in which every fourth beat is early, usually a premature ventricular beat. However, **geminus** itself means "occurring in pairs or couples" and derives from Latin *gemini* 'twins'. **Bigeminal** rhythm (in which a pair of beats is followed by a pause, then another pair, then a pause, etc.) is obviously redundant since **bigeminy** actually means "**two** twins" or two pairs. (Latin *bi* 'two'). **Trigeminy** (three pairs) and **quadrigeminy** (four pairs) are, therefore, also misnomers—however, such is the adversity of life and the misfortune of malapropism.

(In astronomy, the constellation **Gemini** can be found in the southern sky above and to the left of Orion, easily seen during the winter and spring months. The two brightest stars are Castor and Pollux, the mythologic **twins** for whom the constellation is named.)

(**Malapropism,** incidentally, derives from a leading role in the 1775 play *The Rivals* by English playwright Richard Brinsley Sheridan. The character's name was **Mrs. Malaprop,** and she exulted in murdering the King's English, confusing near homonyms as in "I was so hungry I nearly gouged myself to death." Her catchy name comes from the French expression *mal a propos* 'inopportune'. Sheridan is probably best known for his comedy *The School for Scandal.*)

Quartan malaria, caused by *Plasmodium malariae,* is characterized by fever that recurs every four days, the result of the protozoa dividing within the red cell, rupturing the cell membrane, and releasing scores of **merozoites** (Greek *meros* 'part' + *zoion* 'animal'—part of an animal—the offspring of asexual plasmodial reproduction). **Malaria** derives from Italian *mala* 'bad' + *aria* 'air'. It refers to the primitive belief that the putrid, miasmic vapor rising from swamps caused this febrile illness. The ancients were actually very close to the truth—barely missing the true vector, *Anopheles,* whose nuptial bed was sheltered within those swamps. (***Anopheles*** from Greek *an* 'without' + *ophelos* 'use'—that is, useless, or more properly, harmful.

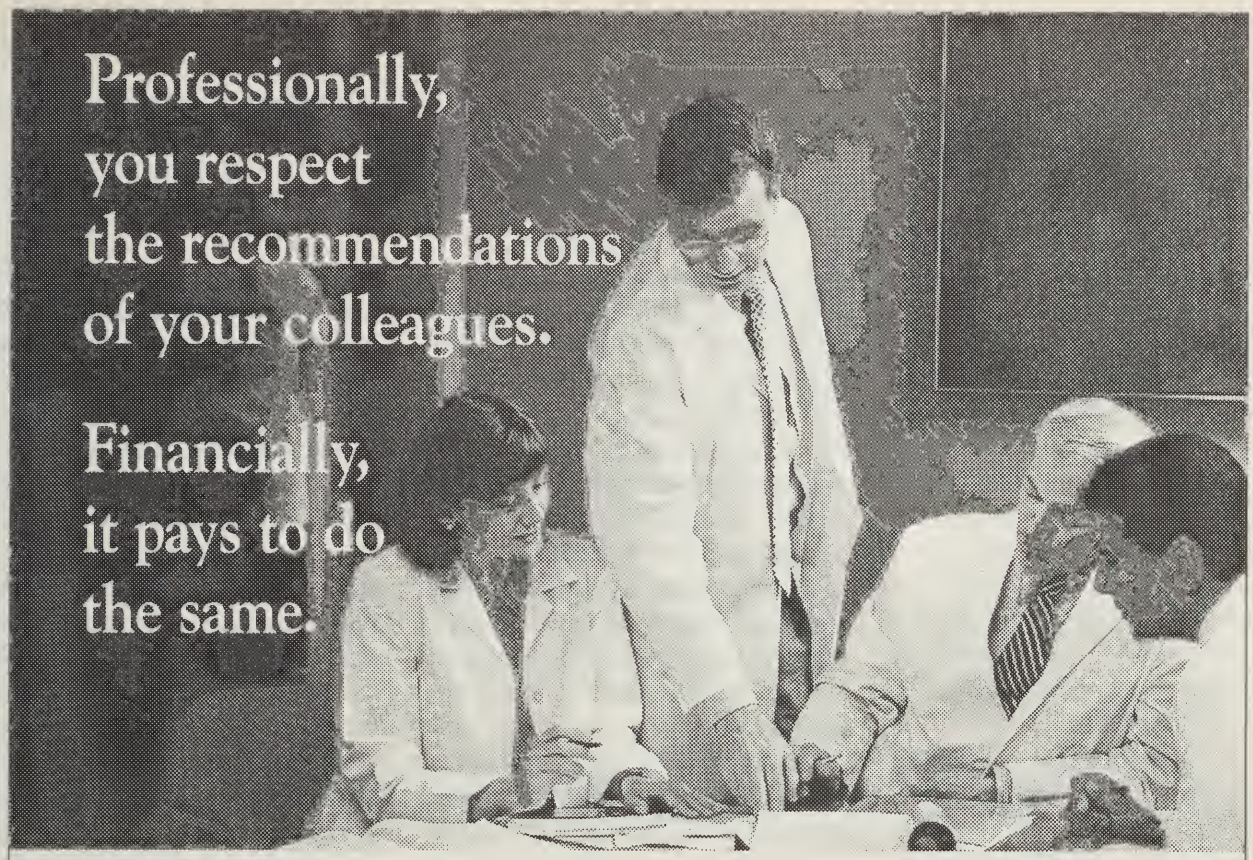
Typhus, a group of disorders caused by rickettsial organisms, has a similar etymology—from the Greek *typhos* 'smoke, clouds, or vapor'—a reference to its etiology, which was equally obscure to early physicians. There are three forms of typhus. **Epidemic typhus** is caused

by *Rickettsia prowazekii* and transmitted by the human louse, *Pediculus humanus.* **Endemic typhus,** caused by *Rickettsia typhi,* is carried by rodents (thus **murine typhus**) and transmitted by their fleas. The third form of typhus is known as **benign typhus,** also called **Brill-Zinsser disease.**

All rickettsial organisms owe their identity to Howard Taylor **Ricketts,** an American pathologist who discovered the organism responsible for **Rocky Mountain spotted fever** *(Rickettsia rickettsii*). Subsequently, Ricketts went to Mexico to investigate a disease known there as **tabardillo,** which ultimately proved to be **endemic** or **murine typhus.** Unfortunately, Dr. Ricketts contracted the disease and died in 1910 at the age of 39.

Stanislas Joseph Matthias von **Prowazek** was a German zoologist. He became interested in those same tiny pleomorphic rods and, in 1913, traveled to Constantinople to study a typhus epidemic. There he convincingly validated Howard Ricketts' observations. Unfortunately, Von Prowazek also succumbed to the deadly organism and died in 1915. He, too, was 39 years old. Both men have been immortalized by the taxonomists.

Benign typhus is actually a recrudescence of epidemic typhus in patients who have become partially immune. The infection may remain latent for as long as 70 years after the initial illness. It was first described in 1910 by Nathan **Brill,** professor of clinical medicine at Columbia University, and confirmed by Hans **Zinnser,** who was professor of bacteriology at that institution. Brill was also noted for describing the clinical and pathological features of **Gaucher** disease and for first suggesting splenectomy as a treatment for idiopathic thrombocytopenic purpura. Zinnser, preeminent in bacteriology for decades, also wrote the biomedical classic *Rats, Lice, and History.* (Philippe Charles Ernest **Gaucher** was a French dermatologist who, in 1882, first described the disease that bears his name. Today, it is a recognized lipid storage disorder caused by a genetic deficiency of glucocerebrosides.)



The rickettsioses embrace a number of other well-known disorders, including Rocky Mountain spotted fever, boutonneuse fever, rickettsialpox, scrub typhus, and Q fever. **Boutonneuse fever,** known by our French cousins as *Fievre Boutonneuse,* is a disease similar to Rocky Mountain spotted fever although much milder, occurring in most Mediterranean countries, Africa, and the Middle East. It is heralded by a primary skin lesion—a black spot found at the site of the tick bite known as the *tache noir.* The resemblance to a small button hole (French *boutonniere*) endows the illness with its name.

Scrub typhus is also known as **tsutsugamushi** fever from the Japanese *tsutsuga* 'harmful or dangerous' + *mushi* 'insect'—a reference to the *Trombiculidae* (mites that transmit the disease).

Q fever, caused by *Coxiella burnetii,* is an unusual rickettsial infection in that it is not spread by the bite of arthropods. Instead, dried tick feces are inhaled with dust or ingested in milk. The disease puzzled microbiologists and epidemiologists for years, and thus became known as the **query disease,** shortened to **Q fever.** The organism itself is named after American bacteriologist Herald Rea **Cox,** and Nobel laureate Frank MacFarlane **Burnet,** who isolated the organism in 1937. (Burnet, an Australian virologist, shared the 1960 Nobel prize for physiology or medicine with British zoologist Peter Medawar for discovering that animal embryos can develop immunological tolerance to administered antigens—leading the way to transplant procedures.)

The number "four," *quattuor* in Latin, becomes *tettares* in Greek, from which we derive the combining form **tetra.** In 1948, an antimicrobial substance was obtained from several species of the soil bacteria *Streptomyces.* Chemically, it consists of a four-ring structure, and, clinically, it is lethal to the rickettsiae. Today, it remains the treatment drug of choice for most rickettsioses.

It is called **tetracycline.** ■

Book Reviews

Mercy or Murder? Euthanasia, Morality and Public Policy. *Kenneth R. Overberg (ed.) Kansas City: Sheed and Ward. 1993. 278 pages. $15.95*

Moses called all Israel and delivered to them the statutes engraved in stone. One of the commandments was: "Thou shalt not kill." Recent headlines seem to indicate that deviation from this ukase may be permissible in certain situations, although it is not a universally accepted decision. The rising intensity of emotional feeling about this obviously controversial subject persuaded Overberg to gather the best contemporaneous thoughts—pro and con—and permit the reader to form an individual judgment.

Two types of euthanasia (the good death) may be distinguished: active or physician-assisted and passive or letting die. At times, only a nebulous boundary separates these forms. This concept is not new, as magistrates in ancient Athens kept a supply of poison for those people wishing a quick death. During the rise of Christianity, however, such activity was denounced as a violation of the will of God. At a much later time, the Euthanasia Society of America was founded with the belief that permitting incurable patients to terminate their existence was merciful and logical. Members summarized their feelings by: "It is not how long we humans live, but how we live that is important."

A despicable form of euthanasia appeared in Germany in the 1920s and 1930s when physicians, with government stimulation and acquiescence, terminated "useless lives." This practice moved from homicide to genocide with the advent of the Holocaust, as the world witnessed the dramatic change from killing incompetent people to murdering persons of different races and thought.

A statement adopted by the American Medical Association (AMA) in 1973 states that the intentional termination of one human being by another—mercy killing—is contrary to the ethics of the medical profession and the policy of the AMA. Cessation of extraordinary means of prolonging life when irrefutable evidence that biologic death is imminent must be a decision of the patient and relatives joined with the advice and judgment of the physician.

In contrast, the Royal Dutch Society for the Promotion of Medicine has advocated euthanasia as a permissible medical practice. The Dutch have dispersed with the terms "active" and "passive." The society also has openly defended physicians accused of homicide by practicing euthanasia. Although the act is a crime in the Netherlands, it is common and open. Estimates suggest that 5,000–8,000 Dutch lives are terminated in this manner each year.

The concept smoldered in the United States until 1991 when the state of Washington almost legalized physician-assisted killing with Initiative 119. Later, the federal Patient Self-Determination Act became effective. Every health care facility receiving Medicaid or Medicare funding was required to inform such patients of their right to decline unwanted treatment, including that which would potentially prolong life.

The Vatican, through the Sacred Congregation for the Doctrine of the Faith, has defined euthanasia as an action or omission that, of itself or by intention, causes death, in order that all suffering in this way may be terminated. Euthanasia, as such, is forbidden, although the use of medication and other treatment to alleviate suffering is encouraged. Considerable difficulty arises when the question of discontinuing nutrition and hydration to a dying patient is encountered. The Vatican does not provide an absolute answer.

Because federal law states that patients have a right not to undergo prescribed treatment, they have the option to live or die. Euthanasia advocates suggest that a patient should be permitted and assisted, if necessary, to exercise this prerogative. The troublesome question may arise: Is the patient with an incapacitating, life-threatening disorder that is pursuing a chronic course, tired of living, or are the relatives and doctors tired of the patient?

The decision for euthanasia or for life as long as it may exist may become nettlesome. This collection of short essays will provide the reader with pertinent material to make a more informed decision. Many of the essayists refer to identical legal actions, declarations, and events and justify their stance according to a personal interpretation. Discussions in this easily read book are crystal clear. Both sides have been granted equal space so that the reader may make an unbiased choice.

As with other difficult-to-resolve societal problems, a stand on euthanasia is easily assumed when encountering unrelated third parties with terminal disease. At the moment, cost containment in health care is the cynosure. Because tremendous sums are spent in giving terminal care to dying elderly patients, euthanasia may be encouraged in such an area. The public, physicians, and clergy must be on guard to prevent such a reaction. If a plan for mercy killing must exist, then the law must rigidly define its parameters. The decision to grasp euthanasia must be a choice of a competent patient after a full discussion with relatives and in agreement with doctors and clergy. Incompetent or brain-dead patients must have decisions made by proxy.

For relatives confronted with the severe suffering of a dying patient, the book is invaluable. As physicians and clergy become involved in judgment, they, too, may gain from this book. In addition, the earlier medical students are introduced to the subject, the easier they may make later choices.

The book should be available in all medical and public libraries. Each chapter is followed by topics for reflection and discussion. Medical cases are presented at the end of the book for judgment by the reader to encourage individual opinion. A list of source material and a good glossary are further credits. The only thing lacking is an index. Overall, the book is a welcome addition to the medical armamentarium as a help in a troublesome situation.

Inside the Temple. The High Cost of Mistaking Medicine for Religion.
James Stacey. Winnetka, IL: Conversation Press, Inc. 1993. 193 pages.
$12.95

With deft sure strokes, James Stacey addresses and analyzes a difficult economic problem facing the new federal administration. Reduction of the large sums being spent for medical care, which at present are not adequate for all citizens, requires keen thought and skill.

Repeated attempts to provide such management have been made since the 1930s. Any number of alphabet agencies aimed at giving proper therapy to rich and poor alike have been devised. This era, inaugurated by the advent of the antibacterial compounds, was extended by numerous highly technologic forms of diagnosis and therapy. Each innovation witnessed a rise in expenditures by the federal government (**Table 1**).

Table 1. Federal expenditures for medical care

Year	Amount
1970	$ 10.5 billion
1975	24.2 billion
1980	51.4 billion
1990	148.0 billion
1993	211.0 (projected)

At the present time, the working poor and a substantial number of middle class families would face tremendous financial difficulties if they had to be hospitalized for any period of time. In the 1930s, the cost of hospital care was $4–$5 per day. Room, board, and ancillary services approached a national average of $400 in 1982 and $700 in 1987. Individual practices and financial rewards grew tremendously. Medical schools also experienced a period of boom with the acceptance of a greater number of students.

Because newly graduated doctors wanted to specialize, they eagerly sought residencies and then fellowships. Medicine then became less of an art and more of a science. Although medical practice later lost its lure for many, societal and federal expenditures, nevertheless, increased dramatically. Hemodialysis, programs to decrease infant mortality, heart–lung machines, coronary bypass procedures, and improved methods of imaging became commonplace in medical practice and added their share to the costs of medical care.

At a time when adjuvants to medicine offered opportunities for marvelous care, many citizens simply could not afford them. In the last part of the 1980s, only

40% of the eligible poor were covered by Medicaid, and more than 37 million people found themselves without health insurance or with critically less than adequate means of protection.

Doctors feared that government and corporations adopting their methods would soon control the practice of medicine. Further disquiet became apparent with the realization that professional liability insurance had become too costly, troublesome, and unpredictable.

Because costs seem to be the linchpin of this complex problem, the total amount spent had to be reduced. The methods suggested to effect this result, although efficacious, will not be pleasing to all concerned:

1. When patients paid for part of their care out of their own pockets, the use of outpatient and hospital facilities dropped 20%.
2. Cost-sharing and deductible limits should be related to income.
3. Ambulatory care centers, since they are less expensive, should be used in preference to hospital emergency rooms.
4. Certain cancers have a notoriously poor prognosis, and perhaps patients with these tumors should not be subjected to surgery or chemotherapy.
5. Much of the terminal care provided in hospitals may be given at home or in a hospice.
6. Cutbacks may be made in hemodialysis and coronary bypass procedures. (Patients with kidney failure have frequent complications to make their lot most unhappy. A study in 1980 suggested that as many as 50% of the operations for coronary bypass might not have been necessary.)
7. At the moment, further high cost equipment should not be installed in hospitals. In addition, some reduction in services and staff seem warranted.

All practitioners, no matter what their specialty, should read this book, and, in reality, they cannot afford to miss it. Many contemporary doctors, although complaining about the paperwork associated with modern medicine, do not have a sharp image of what really has happened in the economic field. Legislators—federal, state, and municipal—will find the volume educational. One hopes, that in combination, they will grasp the significant details and plot a course to ablate the effects of this malignant economic virus affecting society.

American Medical Association State-of-the-Art Conference on Adolescent Health Promotion. Proceedings. *Arthur Elster, Susan Panzarine, and Katrina Holt (eds). Arlington, Virginia: National Center for Education in Maternal and Child Health. 1993. 73 pages.*

The degeneration of adolescent health in recent years occasioned a state-of-the-art conference promoted by the American Medical Association. The assembled group of experts gathered to identify causes and suggest corrective mechanisms to reduce the increased morbidity and mortality in a population that should be enjoying good health. Although many adolescents have gained familial autonomy and an enhanced legal status, too many lack proper maturity and effective parental supervision. These young people are engaging increasingly in a variety of behavior patterns that pose serious threats to their continued good health and well-being.

School health programs play a major part in acquainting teenagers with existing health hazards, particularly in regard to infection with the human immunodeficiency virus (HIV) and sexual relations. Specific attention has also been directed to the prevention of smoking and alcohol and drug abuse, and to improvements in diet and exercise.

Despite these efforts, education has not achieved all the desired effects. Reasons for this relative failure include a lack of coordination by schools, community groups, and individuals. Adolescents cannot be successfully subjected to material intended for adults. Early prevention efforts also wrongfully assumed that merely providing facts could produce changes in adolescent behavior. To be effective, health educators must not only increase basic knowledge but must help young people assess their motivation for behavior change and provide people the necessary skills to make these changes possible.

A surprising similarity was evident in the presentations and subsequent discussions. Universal concepts applicable across school, medical, and community locations were unearthed. Conclusions reached were

1. Prevention efforts should be broadly based.
2. Programs should be relevant to the targeted audience.
3. Coordination of efforts in various

settings and professional disciplines is desirable.
4. Health promotion must have a societal priority to assure the proper use of financial and human resources.
5. Evaluation research should be given greater emphasis.
6. Health care providers, in general, need more training in adolescent health education.

The efforts to direct the thoughts of many groups interacting with adolescents to provide a desired behavior pattern consonant with a life of good quality are more than timely. Social workers, psychologists, educators, and pediatricians will find useful material in this book.

Music Therapy in Palliative/Hospice Care. *Susan Munro. St. Louis: MMB Music Inc. 1984 (second printing, 1993). 112 pages. $12.95*

Are you curious about music therapy? Do some of your patients, terminally ill from cancer, need more relief than just drugs can provide? Susan Munro is a certified music therapist at Montreal's Royal Victoria Hospital Palliative Care Service (a hospice unit) who has trained volunteers in hospice teams on the care of terminal cancer patients, both in the hospital setting and at home. She has provided a useful manual for music therapists.

Munro outlines the consultation roles of music therapists in palliative care staff conferences, discusses the relative values of taped and live music, and offers cautions about cultural issues that can arise in a hospital's multi-ethnic patient population. She provides some guidance in selection of patients and their continued living in the face of dying. Volunteer recruitment and training, as well as bereavement counseling, have separate chapters. Case histories detail the courses of several terminal illnesses and describe beneficial results of selected music.

Throughout the book, instructions for therapists include the themes of great sensitivity and deep respect for seriously ill and vulnerable patients on the Palliative Care Unit, as well as for the families and friends who rally to their support. Music therapists must search for and help each patient select the kind of music that relieves and comforts that individual in a hospice setting. Therapists cannot readily follow music therapy textbook techniques but must leave to the patient the choice of music and decisions on format or timing. Regular consultations with the physicians-in-charge and other members of the palliative care team are stressed. As with other treatment modalities, informed consent for each new part of the individualized music therapy must be scrupulously observed.

Hospice, or palliative care, is an approved mode of care designed to support the physical, psychosocial, and spiritual needs of people at the end of life, with the goal of allowing the dying process to unfold with a minimum of discomfort and the maintenance of dignity and quality of life.[1] A definitive textbook documents advances in the field of palliative care from its development by Dame Cicely Saunders in London in 1958 and its appearance in the United States in 1974.[2] Membership in the Academy of Hospice Physicians now exceeds 1,200 from different specialties. Hospice care teams of nurses, social workers, music therapists, and chaplains provide supporting forms of therapy and relief from suffering that complement traditional medical care.

Music therapy has been useful in treatment of autistic children and psychiatric care of adults. It has lowered anesthetic requirements in delivery suites and has helped relieve pain in burn patients, easing their hospital care through music therapy and relaxation techniques. This form of complementary therapy also has been found valuable in hospital care of surgical patients and has speeded speech rehabilitation in stroke patients. Several national associations of music therapists have established quality standards for this allied health specialty, and provide requisite certification. This short text defines a unique use of music therapy in palliative care, a developing medical specialty.

A word of caution. Read first the reprinted article and letters in the appendix. Then study the clinical care that music therapist Munro describes in the text's case reports. Physicians who would like to add skilled music care to their list of therapeutic options for difficult cases will find Appendix II and this manual helpful in furthering their understanding of music therapy.

In Memoriam

Robert Eckel, M.D.

ROBERT ECKEL, M.D., a neurologist, died August 30 of cancer at Georgetown University Hospital. A native of Cleveland, Dr. Eckel graduated from Dartmouth College and Case-Western Reserve University, where he also completed his residency in internal medicine following an internship at the University of Cincinnati. He completed a second residency in neurology at the University of North Carolina and was a research fellow there before moving to Washington in 1963. A member of the board of the local Kaiser Permanente Organization and the Georgetown University School of Medicine clinical faculty, Dr. Eckel was a specialist in electromyography. Dr. Eckel was a member of the American Medical Association, the American Academy of Neurology, the American Association for the Advancement of Science, and the Montgomery County Medical Society, and served on the Professional Advisory Board of the Epilepsy Foundation of the National Capital Area. An accomplished musician, Dr. Eckel played clarinet and saxophone. Dr. Eckel was 45.

Edward J. Kitlowski, M.D.

EDWARD J. KITLOWSKI, M.D., medical director of New Beginnings at Hiddenbrook (an alcoholism and drug-dependency treatment center in Bel Air), died September 27 at Union Memorial Hospital following a heart attack. A native of Baltimore, Dr. Kitlowski graduated from the Polytechnic Institute, earned a master's degree in genetics from Johns Hopkins and a medical degree from Duke University. He served his internship and residency at Union Memorial Hospital, and practiced plastic and reconstructive surgery in the Baltimore area from 1963 until 1986. Dr. Kitlowski was a fellow of the Occuloplastic Society of America and the Vail Cosmetic Society, and a member of the American Medical Association, the Southern Medical Association, the Founders Group of the John Staige Davis Society, and the American Society of Plastic and Reconstruction Surgery. He had served as chairperson of the Med Chi Committee on Physician Rehabilitation and was a member of the Baltimore County Medical Association. A lecturer at the University of Maryland Department of Psychiatry, Dr. Kitlowski had also served as secretary of the Medical Professional Group of Alcoholics Anonymous, as well as on the board of Pathfinders (a halfway house) and impaired physicians committees at the state level and for St. Joseph Hospital. Dr Kitlowski was 65.

Merton L. White, M.D.

MERTON L. WHITE, M.D., a family practitioner, died August 12, 1993. A forty-year member of the Medical and Chirurgical Faculty of Maryland and a member of the Montgomery County Medical Society, Dr. White had six children and eleven grandchildren. Dr. White lived in Silver Spring.

Thomas Wilson, M.D.

THOMAS WILSON, M.D., a gynecologist and obstetrician, died July 31 of congestive heart failure at the Chesapeake Manor Care Center in Arnold, Maryland. Dr. Wilson, who was 72, retired in 1988 after 36 years in medicine. He was a graduate of Duke University and the George Washington University School of Medicine. He completed his residency at George Washington University Hospital, receiving further training at Hahnemann Medical College and Hospital and at Northwestern University medical school. During World War II, Dr. Wilson served in the Army Medical Corps, later serving as chief of obstetrics-gynecology and chief of the medical staff at Suburban Hospital. A member of the medical societies of Maryland, Montgomery County, and the District of Columbia, he was also a diplomate of the American Board of Obstetrics and Gynecology and the National Board of Medical Examiners. A delegate to the 1964 Republican National Convention, Dr. Wilson served for two years on the County Council; he was elected council president during his second year.

No information was available at press time for the following members:

Members in the News

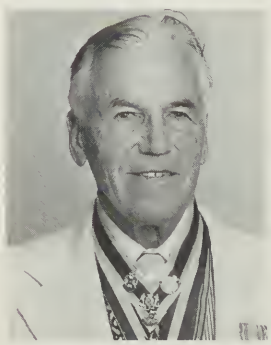
SAMUEL M. ANDELMAN, M.D., a member of the Baltimore County Medical Association, was recently elected a fellow of the American College of Radiology for his outstanding contributions to the field of radiology. His radiology residency was completed at the Mount Sinai Hospital in New York. Since 1970, he has practiced radiology in Baltimore, Maryland, and is a staff radiologist at Franklin Square Hospital. Co-author of a recent book, *MRI of the Joints,* Dr. Andelman previously was assistant chief of radiology at Franklin Square Hospital and currently heads the Magnetic Resonance Imaging (MRI) Department of Drs. Copeland, Hyman and Shackman, P.A.

ALEX AZAR, M.D., an ophthalmologist in private practice in Salisbury, Maryland, was recently appointed to the seven-member Health Care Access and Cost Commission (HCACC) by Governor William Donald Schaefer. The primary responsibility of the HCACC is the practical interpretation of HB 1359, passed during the 1993 legislative session and expected to have a profound effect on health care delivery and financing in Maryland. Dr. Azar, who is board certified in ophthalmology and in occupational medicine, is a graduate of the University of Pittsburgh. He completed a residency in ophthalmology and in preventive medicine at Ohio State University, earning a master's degree at the same time. Long active in organized medicine, Dr. Azar has served as secretary/treasurer, vice president, and president of the Wicomico County Medical Society. For Med Chi, he as served as chairperson of the Bylaws Committee and of the Committee on Small Area Practice Variations; as a member of the Ad Hoc Committee to Select a New Chief Executive Officer and the Ad Hoc Committee to Evaluate Role Relationships in the State Medical Society; as third vice president and first vice president; and as alternate delegate to the American Medical Association. A member of numerous professional societies including the American College of Surgeons, the American Academy of Ophthalmology, the American Society of Cataract and Refractive Surgery, and the Maryland Society of Eye Physicians and Surgeons, Dr. Azar is also the author of numerous scientific articles.

SHAHID AZIZ, M.D., director of pediatrics at Harbor Hospital in Baltimore, Maryland, was recently designated as a diplomate of the American Board of Medical Management (ABMM), the national certifying agency for physician executives. Dr. Aziz completed his undergraduate education at Gordon College in Rawalpindi, Pakistan, and earned his medical degree in 1966 from King Edward Medical College in Lahore, Pakistan. Board certified in pediatrics, he has been with Harbor Hospital for seven years. He is a member of the American Academy of Pediatrics, the Baltimore City Medical Society, the American Diabetes Association, and the Juvenile Diabetes Foundation. He and his wife Jean have three children.

ROBERT S. GOODWIN, M.D., a family physician practicing since 1980 in Owen Brown and Oakland Mills, has completed four years of study at the University of Maryland and received his juris doctor (law) degree. Although he plans to continue to practice medicine, he also intends to become active in mediating medical malpractice claims, which he considers a more amiable method of resolving dispute than going to court. A member of the Howard County Medical Society, Dr. Goodwin also aims to become active in the legislative arena, particularly in the area of health care reform, where he hopes to offer a perspective from "both sides of the fence."

NOEL GRESSIEUX, M.D., who has practiced orthopaedic surgery at Carroll County General Hospital (CCGH) for 18 years, was recently elected president of the hospital's medical staff. As medical staff president, Dr. Gressieux chairs the Medical Executive Committee and the Medical Review



Committee. As a member of the CCGH Board of Directors, he serves as liaison and spokesperson for the interests of physicians in hospital affairs. Past chief of the Department of Surgery, Dr. Gressieux has maintained a private practice in Westminster since 1975, after completing residency programs at Sinai Hospital with rotations through Francis Scott Key, Johns Hopkins, and James Lawrence Kernan hospitals in Baltimore, Maryland.

J. ALEX HALLER, JR., M.D., who is professor of pediatric surgery, pediatrics, and emergency medicine at the Johns Hopkins University, was recently awarded the American Trauma Society's Curtis P. Artz Award for "his brilliant and creative work in establishing criteria for pediatric trauma units, his contributions to the curriculum of the pediatric ATLS [advanced trauma life support] course, and his leadership in trauma care as chief of the division of pediatric surgery at the Johns Hopkins Hospital." Dr. Haller is a certified instructor for the ATLS course of the American College of Surgeons and the advanced pediatric life support course of the American Academy of Pediatrics. A graduate of Vanderbilt University and the Johns Hopkins University School of Medicine, he chaired the Maryland State Committee on Trauma of the American College of Surgeons and the Committee on Trauma of the American Pediatric Surgical Association. He also has served as treasurer for the American Association for the Surgery of Trauma. Two current appointments include vice president of the Pan American Trauma Society and chairperson of the Committee on Pediatric Emergency Medicine for the Maryland Chapter of the American Academy of Pediatrics. A prolific author, Dr. Haller serves on the editorial boards of *Pediatrics*, *American Surgeon,* and the *Journal of Trauma.* He is currently associate medical director of the Maryland Institute for Emergency Medical Services System for Emergency Medical Services for Children. A board member of Marylanders against Handgun Abuse, Dr. Haller was recently honored for his leadership in establishing the Maryland child handgun accident prevention law—the strongest law of its kind in the nation.

MICHAEL M.E. JOHNS, M.D., who is dean of the medical faculty and vice president for medicine at the Johns Hopkins School of Medicine, was appointed to the Board of Directors of Blue Cross and Blue Shield of Maryland effective July 1, 1993. In addition, Dr. Johns was recently elected to the National Institute of Medicine in Washington, DC, in recognition of his major contributions to health and medicine. Dr. Johns was also elected fellow of the American Association for the Advancement of Science for his improvements in the management of malignant diseases of the head and neck. Dr. Johns earned a bachelor's degree in biology from Wayne State University and his medical degree from the University of Michigan medical school. Board certified in otolaryngology, he has published more than 150 scientific papers in the field of head and neck surgery and serves on the Editorial Board of the *Journal of the American Medical Association.* He is a member of the Associated Catholic Charities Corporate Board, the Johns Hopkins Hospital Board of Trustees, and the Center for Hospital Finance and Management National Advisory Council. He is also vice chairperson of the Governor's Commission on Women's Health and co-chairperson of the Governor's State of Maryland Science Week Blue Ribbon Panel. Dr. Johns has two children, both of whom are enrolled in medical school.

HENRY P. LAUGHLIN, M.D., Sc.D., Sc.S.D., received the International Patriot Award on July 2, 1993, at the Pan American University in Washington, DC. The award, the first of its kind, consists of a plaque and a medal with neck ribbon. A psychiatrist from Frederick, Maryland, Dr. Laughlin is a graduate of Ursinus College and Temple University. A former surgeon general and vice president general of the National Society of the Sons of the American Revolution (SAR) and past president of the Maryland Society of SAR, for which he now serves as president of the Council of Presidents, Dr. Laughlin is the inaugural president emeritus of the National Congress of Patriotic Organizations and currently serves as Maryland governor of the Sons and Daughters of the Pilgrims. He served in the US Navy as

physician and surgeon for seven years, rising to the rank of admiral. He became commodore of the US Navy Psychiatrists in 1978, a post he held for three terms. Author of a score of professional books and 148 scientific articles, Dr. Laughlin is editor of the *Physician's Practice Digest* and associate editor of the *Maryland Medical Journal*. Founder and first president of the American College of Psychiatrists, he was also founder and president of the American College of Psychoanalysts. Dr. Laughlin was on the faculty of the George Washington medical school for 35 years, and the University of Louisville School of Medicine for 15 years.

ABDUL NAYEEM, M.D., A.B.F.P., F.A.A.F.P., was recently installed as president of the Maryland Academy of Family Physicians, for which he had previously served as chairperson of the Scientific Programs Committee. Dr. Nayeem graduated from Gandhi Medical College, Osmania University, India, in 1967. He completed a rotating internship at Osmania General Hospital and Nilofer Hospital for Children in India. He then went to the United Kingdom to complete a residency in family practice. He obtained additional training in internal medicine, general surgery, obstetrics/gynecology, and psychiatry at George Washington University and St. Elizabeth's Hospital in Washington, DC. He has had a full-time family practice in Laurel, Maryland, since 1977. Active in organized medicine, Dr. Nayeem is currently vice chairperson of the Med Chi Continuing Medical Education Review Committee, and a member of the Peer Review Committee and the Board of Censors for the Prince George's County Medical Society. He is also a board member of the Maryland Education Foundation and the Greater Laurel-Beltsville Hospital Foundation. Married with three children, Dr. Nayeem is on the staff at Greater Laurel-Beltsville Hospital, Doctors Community Hospital, Prince George's Medical Center, and Washington Adventist Hospital.

MARK D. NOAR, M.D., a gastroenterologist in Towson, has been appointed by the American Society of Gastrointestinal Endoscopy as one of 50 nationwide trainers selected for their expertise in advanced endoscopic techniques. Dr. Noar has also been selected co-editor of a special issue of *Endoscopy*, which will focus on teaching models in gastrointestinal endoscopy and laparoscopic surgery. The creator of two award-winning tapes on diagnostic and therapeutic ERCP (endoscopic retrograde cholangiopancreatography), he is the author of a forthcoming book *Principles of Laparoscopic Surgery*. Dr. Noar earned a bachelor's degree in biology at Ursinus College in Collegeville, Pennsylvania; an M.P.H. from Tulane University in New Orleans; and a medical degree from the Universidad Central del Este in the Dominican Republic. He completed a therapeutic and surgical endoscopy fellowship at the University Hospital Hamburg in West Germany, a gastroenterology fellowship at the State University of New York (SUNY) in Brooklyn, and an internal medicine residency at the University of Nebraska Medical Center in Omaha.

Statement of ownership, management, and circulation

The *Maryland Medical Journal* is published by the Medical and Chirurgical Faculty of Maryland, 1211 Cathedral Street, Baltimore, Maryland 21201. Victor R. Hrehorovich, M.D., editor; Henry P. Laughlin, M.D., Sc.D., Sc.S.D., associate editor; Janet Campbell, managing editor. Editorial Offices: 1211 Cathedral Street, Baltimore, Maryland 21201-5585. Owner: Medical and Chirurgical Faculty of Maryland. No known bondholders, mortgagees, or other security holders.

Total number of copies printed issue nearest filing date: 7,568; monthly average preceding 12 months: 7,862. Paid circulation through dealers, carriers, street vendors, and counter sales: none. Mail subscriptions and total paid circulation: 7,196; average: 7,347. Free distribution: 225; average: 327. Total distribution: 7,421; average: 7,674. Office use, etc.: 147; average: 188.

Total: 7,568; average: 7,862.

Auxiliary

Mildred Taylor—Past president of the Med Chi Auxiliary becomes SMAA president

On October 29, 1993, Maryland will welcome the 70th president of the Southern Medical Association Auxiliary (SMAA), Mildred Taylor (Mrs. Charles E.), a past president of the Auxiliary to the Medical and Chirurgical Faculty of Maryland from Howard County. The Southern Medical Association (SMA) and its auxiliary is the second largest medical association in the United States. Almost 50,000 physicians in the SMA region are members or associate members. Although regional by definition, extending from Maryland to Florida and Texas to Missouri and comprising 16 states and the District of Columbia, SMA has a large out-of-region membership who attend the various programs and functions.

Figure 1. Priscilla Gerber, AMAA president, and Mildred Taylor, SMAA president-elect, hold a congratulatory cake at the 1993 Med Chi annual meeting in College Park.

Since auxiliary membership is contingent upon SMA membership of the physician spouse, it is important to know why SMA is thriving. SMA began in 1906 with the goal of fostering the art and science of medicine. The dues were modest then and continue to be. A spouse automatically becomes an auxiliary member when the physician joins the organization; there are no additional dues. An extensive array of programs and services is offered. Continuing medical education (CME) programs cover timely clinical, legal, and socioeconomic issues as well as practice-oriented subjects. Comprehensive access programs are available, including Dial-Access, Audio Access, Video Access, Computer Access, Information Access, and Clinical Concepts Home Study Series, that are of value to both physicians and spouses.

Figure 2. L to R: Priscilla Gerber, AMAA president; Mildred Taylor, SMAA president-elect and a past Med Chi Auxiliary president; Myrna Goodman, 1992-1993 Med Chi Auxiliary president; and Mary Straus, past AMAA president from Maryland, enjoy the Med Chi annual meeting at College Park, Maryland.

The *Southern Medical Journal*, a multispecialty, peer-reviewed publication, annually prints more than 450 original clinical articles directed toward the practicing physician and surgeon. Pension, purchasing programs, insurance, and travel services are offered through SMA. Its strength lies in excellent CME programs, extensive services, and a fine annual convention that offers an opportunity for physicians and their families to meet, learn, and enjoy time with each other.

As an auxiliary member, there is opportunity to be with spouse and family, attend the special events offered each year, and participate actively as part of the auxiliary leadership. The SMA Auxiliary was organized in New Orleans on November 25, 1924, and this year will begin its 70th year—again in New Orleans. The SMAA is noted for its recognition of physicians, accomplished through establishing National Doctors' Day in 1991 by then President George Bush. The red carnation is the symbol of this special day, and the program has been adopted throughout the United States.

Figure 3. Ching Barretto, Auxiliary councilor, accepts the Taylor Trophy Cup (awarded to the best Doctors' Day exhibit) from Mildred Taylor, SMAA president-elect.

In 1993, the American Medical Association (AMA) and the AMA Alliance (AMAA)—formerly the AMA Auxiliary—used the Doctors' Day postal plate for the first time on all their March mailings. This is not only an SMAA Doctors' Day program as it originated right here in Maryland with the Med Chi Public Relations Committee auxiliary representative (Mildred Taylor).

SMAA shares many activities and members with other medical spouse organizations. Since these associations draw from the basic membership—physicians' spouses—many members are active at a variety of levels. When Priscilla Gerber attended the Med Chi annual meeting in May of 1993, she came not only as AMAA president but as a native Marylander and a member of SMAA. Mary Strauss, our very special past AMAA president from Maryland, is also a member of SMAA. The new AMAA president-elect, Barbara Tippens of Georgia, is a very active SMAA member. In our state alone, there are many spouses who count SMAA, AMAA, the Philippine Medical Society Auxiliary, and the National Medical Association Auxiliary, as part of their auxiliary interests.

SMAA has grown to include a unique program of preserving the medical heritage of the southern states. One of the most prestigious awards for best presentation of southern medical research went to Med Chi's Harford County Auxiliary due to the guidance and hard work of Diane Sitaris who researched the fascinating life of Dr. John Archer, the first recipient of a medical diploma given in the colonies. Med Chi has the actual diploma, which is exhibited in the new library display case given by the Med Chi Auxiliary. This is just one example of the years of medical research compiled by SMAA's Medical Heritage Program.

The newest SMAA project is an intense focus on increasing breast cancer awareness. Billboards were donated throughout the south stressing that one in nine (now possibly one in eight) women could develop this

Figure 4. Mildred Taylor, Med Chi Auxiliary Health Projects chairperson, holds a mock-up of the breast cancer awareness billboards with the Orioles bird.

dread disease. In Maryland alone, 19 billboards have been sponsored from the mountains to the ocean. Countless posters, pins, and booklets have been distributed, and training sessions and educational programs have been sponsored.

But SMA and SMAA are not all work and no play. The annual convention held in New Orleans over Halloween gave evidence to that. The time and place alone meant that all participants could relax, enjoy, and "let the good times roll." Next year, SMA will meet in Orlando, Florida, with families for a very special time of orange blossoms, Disney World, and education. There will be an exciting SMAA program, spouse and companion recreational opportunities (golf, tennis, swimming), and a youth program including licensed day-care, plus, as always, educational opportunities. And most important of all, there will be time for everyone to do what is most enjoyed—meet old friends, make new ones, and join together in real southern style.

4th Annual conference on Addiction

The problems of addiction and the need for treatment are ever-present in our society. Primary care physicians and other health care professionals must be able to screen, diagnose, and initiate treatment for their patients with addictive disorders. The 4th Annual Conference on Addiction is designed to educate all health care professionals in fulfilling these essential patient needs.

The conference has been designated for 8 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Speakers at the conference will be Max A. Schneider, M.D.; David Nurco, D.S.W.; The Honorable Harold E. Hughes; Lee P. Brown, Ph.D.; Father Joseph C. Martin, S.S.; and N. Joseph Gagliardi, M.D.

Registration fees for this conference include tuition, continental breakfast, refreshment breaks, lunch, and materials. Costs are $60 for Med Chi members, $100 for nonmember physicians and Ph.D.s, $40 for allied health professionals, and no charge for medical students and residents. To register and for further information on this exceptional conference, call the Physician Rehabilitation Program at 410-962-5580 or 1-800-992-7010.

For Your Benefit

Three regional AMA meetings to expand two-way communications

Plans for three regional AMA-sponsored meetings, titled "Physicians Forum: Agenda for Action," have been announced by AMA President Joseph T. Painter, MD.

The goal of the fall meetings, to be held in San Francisco, Dallas and Philadelphia, will be to expand two-way communications between the AMA leadership and grass roots physicians.

"It will give us a chance to tell physicians--members and non-members alike--what the AMA has done and is planning to do on their behalf," Dr. Painter said. "We also want to hear from those physicians--about their problems, their concerns, their activities."

An important element of the regional events will be to inform physicians of what is really happening in government today.

"Given the stimulus for reform or change in the health delivery system, it is overwhelmingly important for the profession to be united in understanding of goals and objectives, as well as aware of and supportive of the actions being taken on behalf of the profession by its leadership," he said.

Clinton administration officials, members of Congress and other key players in system reform will take part in each meeting.

The meetings are being designed to build on the success of the AMA's Washington event, "A Time for New Partnership," in March.

"We were delighted with the response to the Washington meeting from physicians throughout the country," said Dr. Painter.

"We were particularly impressed by how many of the participants were not formally involved in organized medicine, but literally physicians from 'back home.' These three regional meetings will enable us to reach out to even more physicians and involve them in the health policy arena," he added.

Regional meeting dates and locations are:

- Oct. 23, San Francisco
- Nov. 5, Dallas
- Nov. 20, Philadelphia

There will be an optional reception on the evening preceding each event, and additional optional educational and leadership workshops on the morning after each one.

Complete program details will be announced shortly. For additional information and registration information, call (800) 621-8335.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

New physician pay disparity ended

Years of persistent AMA and Young Physicians Section grass roots efforts paid off as the House and Senate passed the budget reconciliation package, including provisions to end Medicare new physician pay disparity.

AMA lobbyists worked around the clock with Senate Republicans to retain new physicians and EKG provisions in the budget reconciliation package.

Pay equity provisions will take effect Jan. 1, 1994.

Numerous members of the AMA Young Physicians Section effectively and persistently pursued and supported this grass roots initiative, the AMA said.

Conglomerates could limit patient, physician choice, AMA warns

Increased power of insurance and hospital conglomerates could limit patient choice and take away physicians' right to make medical decisions, the AMA told Hillary Rodham Clinton in an Aug. 9 letter.

"Spurred by talk of 'managed competition' and the prospect of 'health alliances' with substantial purchasing power, the nation's largest health care insurers and hospital systems have already moved decisively to control health care delivery," AMA EVP James S. Todd, MD, wrote.

Although the AMA supports mergers to eliminate duplication and waste, the Association said the conglomerates' true aim is to establish large national firms that will dominate the "anticipated and newly configured health care marketplace."

Conglomerates could strip medical decision-making from physicians -- the very group that administers the care.

"How the administration's proposal deals with insurer and purchaser market power will determine how well the new system can ensure quality and preserve choice," Dr. Todd said.

Three issues were spelled out in the letter:

- Antitrust laws must be clarified so physicians can form competing systems and effectively negotiate with giant insurance and hospital plans.
- All managed care plans must meet minimum standards for physician involvement in their medical policies and guarantee physicians a significant role in the managed competition system of alliances and accountable health plans.
- Reform must include a pluralistic and competitive system with all forms of reimbursement.

Coalition formed to ensure medical liability reform

The AMA and five other health industry organizations have formed the Coalition for Effective National Medical Liability Reform, which will work to gain public and Congressional support for meaningful medical liability reform.

The new coalition is launching a full-fledged public relations, lobbying and grassroots campaign. It hopes to communicate the inadequacy of the current liability system and demonstrate that it increases health care costs, reduces access to care and damages the physician/patient relationship.

The group will work to gain support on patient safety issues and to ensure federal implementation of California-style tort reform, called the Medical Injury Compensation Reform Act or MICRA. The coalition also will continue to oppose the unproven "cost-shifting" concept of "enterprise liability."

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

WELCOME!

The Medical and Chirurgical Faculty of Maryland welcomes the new members listed below. They join an organization with a 194-year history of dedicated service to improving the health and welfare of the people of Maryland. With the help and expertise of longtime members and the participation and input of new members, Med Chi can continue its proud tradition of ensuring quality health care.

SECTION: Surgery

Medical Policy

SUBJECT: **Plastic Surgery**

EFFECTIVE DATE: **8/27/93**

REVISED DATE **9/15/93**

CPT/HCPCS Code(s): 15780 - 15783, 15820 - 15823, 15824 - 15829, 15831, 15876 - 15879, 19316, 19318, 19324, 19325, 19328, 19330, 19340, 19342, 19350, 19357, 19361, 19362, 19364, 19366, 19370, 30400 - 30450, 67900 - 67906

Description of Service: According to the American Society of Plastic and Reconstructive Surgeons the specialty of plastic surgery includes two kinds of procedures:

Reconstructive Surgery

Reconstructive surgery is performed on abnormal structures of the body, caused by congenital defects, developmental abnormalities, trauma, infection, tumors or disease. It is generally performed to improve function, but may also be done to approximate a normal appearance.

Cosmetic Surgery

Cosmetic surgery is performed to reshape normal structures of the body in order to improve the patient's appearance and self-esteem.

Clinical Indications: Cosmetic surgery performed purely for the purpose of enhancing one's appearance is not eligible for coverage. However, surgery to correct congenital defects, developmental abnormalities, trauma, infections, tumors or disease is eligible for coverage because the surgery is considered reconstructive in nature.

Cosmetic surgery performed to treat psychiatric or emotional problems is not covered.

Corrective facial surgery will be considered cosmetic rather than reconstructive when there is no functional impairment present. However, some congenital or developmental anomalies may not result in functional impairment, but are so severely disfiguring as to merit consideration for corrective surgery. For example, the cranio-facial anomalies associated with Treacher-Collins Syndrome should be reviewed as an individual consideration.

If a non-covered cosmetic surgery is performed at the same operative period as a coverable surgical procedure, benefits will be provided for the coverable surgical procedure only.

Benefits are provided for complications arising from cosmetic surgery as long as infection, hemorrhage, or other serious documented medical complication occurs.

PAYMENT WILL BE MADE FOR THE FOLLOWING PROCEDURES WHEN PERFORMED FOR THE REASONS INDICATED:

1. **Augmentation Mammoplasty (CPT 19324, 19325)** Augmentation mammoplasty (breast enlargement) is generally a cosmetic procedure. When performed to replace absent breast tissue secondary to prior tumor removal, trauma or infection or to correct gross variation in breast size (post-mastectomy), the procedure is considered reconstructive.

2. **Mastopexy (CPT 19316)** This procedure will be denied as primarily cosmetic.

3. **Reconstructive Breast Surgery (CPT 19340, 19342, 19350, 19357, 19361, 19362, 19364, 19366)** Coverage will be based on the following limited coverage criteria:

   - Acquired deformity of the breast, 611.8

   - Personal history of breast carcinoma, V10.3

Reconstruction may be performed with an implant simultaneously with the breast's removal (CPT 19340), with an implant at a later date (CPT 19342); or with insertion of a tissue expander (CPT 19357). In the event of a total mastectomy, the nipple - areolar complex may be reconstructed (CPT 19350). Breast reconstruction may also be performed with a latissimus dorsi flap, transverse rectus abdominous flap with or without microvascular anastomosis, free flap or other technique (CPT 19361, 19362, 19364, 19366).

Following a mastectomy, reconstructive surgical procedures such as augmentation or reduction mammoplasty may be performed on the other breast to make the chest as symmetrical as possible.

4. **Reduction Mammoplasty (CPT 19318)** is the surgical excision of a substantial portion of the breast, including the skin and the underlying glandular tissue, until a clinically normal size is obtained. Reduction mammoplasty, while sometimes considered cosmetic to correct sagging or to improve appearance, is usually reconstructive and prompted by physical necessity. Female breast hypertrophy (macromastia) is the development of abnormally large breasts in the female. This condition can cause significant clinical manifestations when the excessive breast weight adversely affects the supporting structures of the shoulders, neck, and trunk. Coverage will be based on the following limited coverage criteria:

   a. Macromastia, gigantomastia with symptoms;

      - Intertrigo, 695.89
      - Neck and shoulder pain, 719.41, 723.5
      - Strap mark indentations, 695.89
      - Poor posture and postural backache, 724.5, 781.9
      - Restriction of physical activities

   b. With contralateral mastectomy and secondary reconstructive procedure.

      There are wide variations in the range of normal female height, body weight and associated breast

sizes; the amount of breast tissue that must be removed to relieve symptoms therefore varies with the height and weight of each patient (for example, a small-statured woman will need proportionally less breast tissue removed to alleviate signs and symptoms of macromastia than a larger woman. As a general rule, the removal of 300 or more grams of breast tissue must be removed from each breast (pathology report must be submitted).

5. **Removal of Breast Implants (CPT 19328, 19330, 19370)** For a patient who has had an implant(s) placed for reconstructive or cosmetic purposes, Medicare considers treatment of any one or more of the following conditions to be medically necessary:

   - Broken or failed implant
   - Infection
   - Implant extrusion
   - Siliconoma or granuloma
   - Interference with diagnosis of breast cancer
   - Painful capsular contracture with disfigurement

6. **Abdominal Lipectomy (CPT 15831)** is the surgical removal of excessive fat and skin from the abdomen. When surgery is performed to alleviate such complicating factors as a) inability to walk normally, b) chronic pain, c) ulceration created by the abdominal skin fold or dermatitis, such surgery is considered reconstructive. Pre-operative photographs may be required to support justification and should be supplied upon request.

7. **Suction - Assisted Lipectomy (CPT 15876 - 15879)** is a surgical procedure employing high vacuum pressure to "suction" away localized collections of unwanted fat. When the procedure is utilized to remove a lipoma it is considered reconstructive surgery.

8. **Dermabrasion (CPT 15780 - 15783)** Coverage will be provided when correcting defects resulting from traumatic injury, surgery, or disease. Dermabrasion performed for post-acne scarring is classified as cosmetic and is not eligible for payment.

9. **Rhytidectomy (CPT 15824 - 15829)** Coverage will be provided when functional impairment as a result of a disease state exists (e.g., facial paralysis).

10. **Blepharoplasty (CPT 15820 - 15823) and Blepharoptosis (CPT 67900 - 67906)** Blepharoplasty may be defined as any eyelid surgery that improves abnormal function, reconstructs deformities, or enhances appearance. It may be either reconstructive or cosmetic (aesthetic).

    Cosmetic Blepharoplasty

    When blepharoplasty is performed to improve a patient's appearance in the absence of any signs and/or symptoms of functional abnormalities, the procedure is considered cosmetic and non-covered under the Medicare program.

    Reconstructive Blepharoplasty

    When blepharoplasty is performed to correct visual impairment caused by drooping of the eyelids (ptosis); repair defects caused by trauma or tumor-ablative surgery (ectropion, entropian corneal exposure); treat periorbital sequelae of thyroid disease and nerve palsy; or relieve the painful symptoms of blepharospasm, the procedure should be considered reconstructive.

    Indications for Reconstructive Blepharoplasty:

    a. Pseudoptosis causing visual impairment ICD-9: 374.33, 374.34, 368.44, 701.8

        In this condition, the upper-lid skin becomes redundant and lax to such an extent that it "hoods" the eye, restricting the patient's upward gaze and blocking peripheral vision. When the upper-lid skin rests on the eyelashes, even forward gaze can be impaired. Skin redundancy (dermatochalasis) and/or

muscle laxity is corrected with a reconstructive upper-lid blepharoplasty that removes excess tissue and restores visual function. Patients may also develop intermittent swelling of the eyelids (blepharochalasis), which is often related to allergic reactions and is treated in a similar fashion.

Hooding of the lateral upper eyelids may be aggravated by redundancy and ptosis of the skin of the lateral forehead and eyebrows. This is an exaggerated effect of aging. Correction of eye lid skin redundancy when associated brow ptosis is untreated may not provide satisfactory results. In these cases, a brow lift with excision of excess forehead or anterior scalp skin may be required to suspend the brows in a more normal position and relieve the ptosis.

b. True ptosis with dermatochalasis, ICD-9: 374.33

Dermatochalasis (excessive skin redundancy) may mask the presence of ptosis. The added weight on the upper lids may aggravate a mild ptotic condition, leading to restricted vision. Correction of dermatochalasis is an integral part of ptosis treatment to restore vision.

c. Primary essential (idiopathic) blepharospasm, ICD-9: 333.81, 728.9

This condition is characterized by severe squinting, secondary to uncontrollable spasms of the periorbital muscles. Occasionally, it can be debilitating. Treatment includes extended blepharoplasty with wide resection of the orbicularis oculi muscle complex.

d. Intrinsic Eyelid Deformities

Secondary to birth defects, ICD-9: 743.61, 743.62, 743.63, 743.64, 743.65, 744.66

Post-traumatic, ICD-9: 906.0, 906.1, 906.2, 906.3, 906.4, 906.5

Keloid scar formation, ICD-9: 701.4, 709.61

Entropian, ICD-9: 374.01, 374.02, 374.03

Ectropion, ICD-9: 374.11, 374.12, 374.13, 374.14

These abnormalities may be congenital, a result of injury, or an after-effect of surgery for lesions on the eyelids. Surgery is performed to reconstruct the normal structure of the eyelids using local or distant tissue. If entropian (turned-in lash margins) or ectropion (eversion of lids) is left untreated, significant irritative keratitis can lead to cornea erosion. Both upper and lower lids may be affected by these conditions.

In cases of unilateral reconstruction, the opposite eyelid may require surgery to produce a symmetrical appearance.

e. Cranial nerve palsy, ICD-9: 351.0, 998.2

Partial or complete palsy of the facial (seventh cranial) nerve or the oculomotor (third cranial) nerve can cause true ptosis or pseudoptosis from marked periorbital muscle paralysis. Symptoms such as exposure keratitis and cornea erosion (facial nerve) or visual restriction (oculomotor nerve) may occur. When lesions involving the temporal branch of the facial nerve are present, treatment consists of reconstructive blepharoplasty with or without brow lift. Third-nerve palsy may require frontalis fascial suspension to obtain an adequate eyelid opening.

f. Thyroid disease, ICD-9: 242.0, 242.1, 242.2, 242.3242.4, 242.5, 242.6, 242.7, 242.8, 376.21

Symptoms associated with thyroid disease can include unilateral or bilateral upper-eyelid retraction and proptosis (protruding eye). Frequently, medical therapy for the thyroid pathology will resolve these deformities, but occasionally, reconstructive blepharoplasty is necessary to prevent corneal exposure and erosion.

Coverage for Blepharoplasty will be provided when visual impairment is documented by:

- visual field study, interpreted by the physician who performed the study, and
- documentation that the eyelids' condition is causing visual impairment

Pre-operative photographs may be required to support justification and should be supplied upon request.

Lower lid blepharoplasty is generally not reimbursable, since it is usually performed for cosmetic purposes. Benefits are provided only for severe cases which must be documented by photographs.

11. **Rhinoplasty (CPT 30400 - 30450)** Nasal surgery is defined as any procedure performed on the external or internal structures of the nose, septum or turbinates. This surgery may be performed to improve abnormal function, reconstruct congenital or acquired deformities, or to enhance appearance. It generally involves rearrangement or excision of the supporting bony and cartilaginous structures, and incision or excision of the overlying skin of the nose.

    Nasal surgery, including rhinoplasty, may be reconstructive or cosmetic in nature. Current CPT codes do not allow distinction of cosmetic or reconstructive procedures by specific codes, therefore categorization of each procedure is to be distinguished by the presence or absence of specific signs and/or symptoms.

    <u>Cosmetic Nasal Surgery</u>

    When nasal surgery is performed solely to improve the patient's appearance in the absence of any signs and/or symptoms of functional abnormalities, the procedure

should be considered cosmetic in nature and non-covered under the Medicare Program.

Reconstructive Nasal Surgery

When nasal surgery, including rhinoplasty, is performed to improve nasal respiratory function, correct anatomic abnormalities caused by birth defects or disease, or revise structural deformities produced by trauma, the procedure should be considered reconstructive.

Reconstructive nasal surgery is generally directed to improve nasal respiratory function (airway obstruction or stricture, synechia formation); repair defects caused by trauma (naso-septal deviation, intranasal cicatrix, dislocated nasal bone fractures, turbinate hypertrophy); treat congenital anatomic abnormalities (cleft lip nasal deformities, choanal atresia, oronasal or oromaxillary fistula); treat nasal cutaneous disease (rhinophyma, dermoid cyst); or to replace nasal tissue lost after tumor ablative surgery.

Billing Instructions: Physician documentation which fully supports the medical necessity for cosmetic/reconstructive surgery must accompany each claim. Pre-authorization requests are not required. Medicare does not pre-authorize cosmetic/reconstructive surgery cases.

SECTION: Drugs and Biologicals

Medical Policy

SUBJECT: **Erythropoietin/EPO/Epoetin Alfa/PROCRIT/Epogen**

EFFECTIVE DATE: **6/1/89**

REVISED DATE: **4/1/93**

CPT/HCPCS Code(s): **A4649, Q9920 - Q9940, 90782**

Description of Service: EPO is a glycoprotein which stimulates red blood cell production. It is produced in the kidney and stimulates the division and differentiation of committed erythoid progenitors in the bone marrow. PROCRIT, a 165 amino acid glycoprotein manufactured by recombinant DNA technology, has the same biological effects as endogenous erythropoietin.

Clinical Indications:

1. EPO is covered for the treatment of anemia for patients with chronic renal failure who are on dialysis (ESRD patients) when:

   - It is administered in the renal dialysis facility;
   - It is administered incident to a physician's service or
   - It is administered by a home dialysis patient or patient caregiver who is determined competent to use the drug and meets the other conditions.

NOTE: Payment may not be made for EPO under the "incident to" provision when EPO is administered in the renal dialysis facility. For the "incident to" a physicians service provisions to be met, 1) the cost of EPO must represent an expense to the physician who administers it, 2) it must be administered by the physician or by someone in the physician's direct employ and 3) if administered by

someone in the physician's employ, it must be administered under the physician's direct, personal supervision.

Payment for EPO is made to the facility as an addition to the composite rate payment. The add-on amount is a nationally set payment and is the same for both independent and hospital based dialysis facilities regardless of geographic area. The payment rate is statutorily set at $11 per 1000 units rounded to the nearest 100 units.

SELF ADMINISTRATION OF EPO

Effective July 1, 1991, Medicare covers EPO and items related to its administration for **dialysis patients** who use EPO in the home when the following conditions are met:

- The patient's dialysis facility or the physician responsible for all the patient's dialysis related services makes a comprehensive assessment of the patient that includes measurement of the patient's hematocrit or hemoglobin, serum iron, transferrin saturation, serum ferritin, and blood pressure;

- The patient is on home dialysis (either peritoneal or hemodialysis method);

- The patient is trained to inject EPO or has an appropriate caregiver who is trained to inject EPO;

- Upon initiation of EPO therapy, the patient has a hematocrit of less than 30% or hemoglobin less than 10gm unless medical documentation justifies a patient's need for EPO with a higher hematocrit or hemoglobin level. For example, a patient with severe angina, severe pulmonary disease or severe hypotension may require EPO to prevent adverse symptoms even though the patient has a higher hematocrit or hemoglobin;

- The patient is under the care of the physician who is responsible for the dialysis related services and who prescribes EPO, and under the care of the renal dialysis facility that establishes the plan of

care for the services and monitors the progress of the home EPO therapy;

- The patient's physician or facility develops an appropriately designed protocol for the patient for the safe and effective use of the drug. The protocol must include:
  - Monitoring of blood pressure;
  - A review of diet and fluid modifications to monitor for adequate iron stores and hyperkalemia;
  - A re-evaluation of the dialysis prescription taking into account the patient's increased appetite and red blood cell volume;
  - A method for follow-up on blood tests and a mechanism for keeping the physician informed of the results; and
- The patient (or patient's caregiver) is trained by the facility to inject EPO, is capable of reading and understanding drug labeling, and is trained in, and capable of observing, aseptic techniques.
- The provider should limit the amount of EPO furnished to a two-month supply

The following providers may furnish EPO for home self-administration:

- Medicare approved dialysis facilities
- Suppliers of home dialysis equipment
- Suppliers of durable medical equipment

COVERAGE OF MEDICAL VISITS AND ADMINISTRATION SERVICES:

- Medical visits and drug administration services of physicians being reimbursed the monthly capitation

payment (MCP) are included in the MCP and should not be separately billed.

- An administration fee is payable to physicians administering EPO to the chronic renal disease patient who is not on dialysis. Report administration fees under CPT 90782.

- Non-MCP physicians must look to the MCP physician for compensation for his or her medical services, such as office visits. An administration fee is payable to a non-MCP physician. Report administration fees under CPT 90782.

- When a patient is on and off of dialysis, no additional allowance for medical services are available when the purpose of the visit is to receive the EPO injection.

2. EPO is also covered for the treatment of anemia in patients being treated with the anti-viral drug AZT (Zidovudine) which is currently being used to treat patients with acquired immunodeficiency syndrome (AIDS) and AIDS-related complex (ARC). **Patients with symptomatic anemia considered for EPO therapy should have a hematocrit less than 30% or hemoglobin less than 10gm.**

   EPO is not indicated for the treatment of anemia in HIV-infected patients due to other factors such as iron or folate deficiencies, hemolysis or gastrointestinal bleeding which should be managed appropriately. NOTE: Monitor iron levels during EPO therapy as iron will be rapidly utilized in making new red blood cells.

   EPO, at a dose of 100 - 300 units/kg three times per week, is effective in increasing the red blood cell level and decreasing transfusion requirements in anemic, HIV-infected patients treated with Zidovudine, when the endogenous serum erythropoietin level is < 500 mU/ml or less when patients are receiving a dose of Zidovudine < 4200 mg/week.

3. Effective 4/1/93, EPO is covered for the treatment of chemotherapy induced anemia in patients with non-myeloid malignancies. EPO is indicated to decrease the need for transfusions in patients who will be receiving concomitant chemotherapy for a minimum of two months. **Patients with symptomatic anemia considered for EPO therapy should have a hematocrit less than 30% or hemoglobin less than 10 gm.**

   It is not indicated for the treatment of anemia in cancer patients due to other factors such as iron or folate deficiencies, hemolysis or gastro intestinal bleeding which should be managed appropriately.

   The recommended EPO dose for the treatment of chemotherapy induced anemia is 150 - 300 units/kg administered subcutaneously three times weekly. A serum EPO level of 500 mU/ml or less must be present before coverage is allowed. For an optimal response, a serum EPO level of 200 mU/ml or less is suggested and treatment for an anemia with a level greater than this is not recommended in the labeled instructions.

   There is EPO testing available free of charge from a drug distributor.

4. Off-labeled Uses

   Additional uses of EPO in the treatment of anemic patients outside of the above listed indications, not experimental or investigative, will need to be accompanied by a Letter of Medical Necessity and peer reviewed literature documenting safety and efficacy.

   Where there have been published studies of the safety and efficacy of EPO therapy (multiple myeloma, 203.0 and myelodysplastic syndrome, 238.7) a Letter of Medical Necessity will need to accompany the claim. These claims will be reviewed by the Medical Director.

ROUTES OF ADMINISTRATION COVERED ARE:

1. intravenous, 1-3 times a week
2. subcutaneous, 1-6 times a week

Billing Instructions:

Initial Claims

Because of the amount of documentation required on initial claims for EPO, they must be submitted on paper claim forms; initial EPO claims cannot be accepted via electronic media. All initial claims must be accompanied by a copy of the invoice for the purchase of the drug.

All initial claims must be accompanied by a facsimile of the form shown attached to this policy and completed with all of the following information:

1. ICD-9-CM code for both the renal disease (585) and the anemia (281.9, 285.8, 285.9);
2. ICD-9-CM code for both the AIDS and ARC (042-044.9);
3. ICD-9-CM code for type of malignancy and the anemia (281.9, 285.8, 285.9);
4. Date and value of the most recent hematocrit and hemoglobin prior to initiation of EPO therapy;
5. Date and value of the most recent creatinine prior to initiation of EPO therapy for patients with chronic renal failure;
6. Date and value of EPO level for patients with non-myeloid malignancies and HIV-infected patients;
7. Dosage of EPO in units/kg.
8. Weight of patient in kg.
9. Number of units initially administered.

Subsequent Claims

Subsequent claims may be submitted either on paper or via electronic media and must include:

1. ICD-9-CM code for the disease and the anemia;
2. The patient's most recent hematocrit level (Report by using the applicable HCPCS procedure code from the list below);
3. The total number of units administered; and
4. The modifier code "EJ" following the code for the drug to indicate that this is a subsequent claim.

EPO for self-administration should be billed as follows:

1. Dialysis facilities furnishing EPO for self-administration must seek payment from Medicare Part A.
2. Suppliers of dialysis equipment or durable medical equipment who furnish EPO must file an **assigned** claim to Medicare Part B. Their claims must include:
    - the appropriate "Q" procedure code;
    - the appropriate documentation for EPO therapy; and
    - the name and UPIN of the physician who ordered the EPO for self-administration
3. Additionally, the supplier may bill for the furnishing of medically necessary syringes (HCPCS A4649) used for the administration of the drug.

HCPCS Codes for EPO

Q9920-- Injection of EPO, per 1,000 units, at pt. HCT of 20 or less

Q9921-- Injection of EPO, per 1,000 units, at pt. HCT of 21

Q9922--	Injection of EPO, per 1,000 units, at pt. HCT of 22
Q9923--	Injection of EPO, per 1,000 units, at pt. HCT of 23
Q9924--	Injection of EPO, per 1,000 units, at pt. HCT of 24
Q9925--	Injection of EPO, per 1,000 units, at pt. HCT of 25
Q9926--	Injection of EPO, per 1,000 units, at pt. HCT of 26
Q9927--	Injection of EPO, per 1,000 units, at pt. HCT of 27
Q9928--	Injection of EPO, per 1,000 units, at pt. HCT of 28
Q9929--	Injection of EPO, per 1,000 units, at pt. HCT of 29
Q9930--	Injection of EPO, per 1,000 units, at pt. HCT of 30
Q9931--	Injection of EPO, per 1,000 units, at pt. HCT of 31
Q9932--	Injection of EPO, per 1,000 units, at pt. HCT of 32
Q9933--	Injection of EPO, per 1,000 units, at pt. HCT of 33
Q9934--	Injection of EPO, per 1,000 units, at pt. HCT of 34
Q9935--	Injection of EPO, per 1,000 units, at pt. HCT of 35
Q9936--	Injection of EPO, per 1,000 units, at pt. HCT of 36
Q9937--	Injection of EPO, per 1,000 units, at pt. HCT of 37
Q9938--	Injection of EPO, per 1,000 units, at pt. HCT of 38
Q9939--	Injection of EPO, per 1,000 units, at pt. HCT of 39
Q9940--	Injection of EPO, per 1,000 units, at pt. HCT of 40 or above

The code which accurately reflects the patient's hematocrit level must be used when billing for EPO.

1. Enter a separate line item for injections at different HCT levels.

2. Multiple doses of EPO may be included as a single line item, while the patient's HCT remains the same.

3. The standard unit of EPO is 1000 units. Enter 1 in the "unit" field for every 1000 units administered. For example, if 12,000 units were administered, enter 12 as the units administered. When the dosage is not an even multiple of 1000, the dose should be rounded. For dose 1 to 499, round down. For dosages of 400 - 999, round up to the next 1000 units.

At anytime any of the following conditions exist, documentation must be submitted with the claim in order to justify the administration of EPO:

A. Initial Claim

- HCT greater than 29
- Serum creatinine less than 3
- Dose greater than 300 units/kg

B. Subsequent Claims

- HCT greater than 36

For those patients who respond to EPO therapy, coverage will be provided for EPO therapy until the patient's hemoglobin reaches 12 or the hematocrit reaches 36%. Coverage will not be provided for continued administration of EPO once the hemoglobin is 12 or higher or the hematocrit is 36% or higher. If, after 8 weeks of EPO therapy without blood transfusion, the patient's hemoglobin level has not risen by greater than 1 gram, or the hematocrit has not risen by greater than 3 points, than the patient's anemia would be considered non-responsive to EPO and continued EPO therapy could not be covered by Medicare. The Carrier Medical Director will make the final decision concerning continued coverage.

SECTION: Radiology

Medical Policy

SUBJECT: **Mammography**

EFFECTIVE DATE: **1990**

REVISED DATE: **8/23/93**

CPT/HCPCS Code(s): **76090, 76091, 76092**

Description of Service: Mammography is an x-ray examination of the breast.

Clinical Indications:

- a patient has distinct signs and symptoms for which a mammogram is indicated
- a patient has a history of breast cancer; or
- a patient is asymptomatic but, on the basis of the patient's history and other factors the physician considers significant, the physician's judgement is that a mammogram is appropriate
- fibrocystic disease is coverable when supporting radiological reports are submitted.

USE OF MAMMOGRAM IN ROUTINE SCREENING

Effective January 1, 1991, Medicare began covering screening mammographies for eligible beneficiaries. Screening mammographies are regular, routine examinations for early detection of breast cancer. A doctor's prescription or referral is not necessary for an eligible beneficiary to be covered for a screening mammogram. **UNLIKE DIAGNOSTIC MAMMOGRAPHY, NO SYMPTOMS NEED BE PRESENT FOR THE EXAM TO BE COVERED.** Coverage applies as follows:

- No payment may be made for a screening mammography performed on an asymptomatic woman under 35 years of age;

- Pay for only one screening mammography performed on an asymptomatic woman between her 35th and 40th birthdays (ages 35 thru 39); and

- For an asymptomatic woman over 39, but under 50 years of age (ages 40 thru 49), pay for a screening mammography performed after 11 full months have passed following the month in which the last screening mammography was performed if the woman is at high risk of developing breast cancer because she:

  - Has a personal history of breast cancer, V10.3;
  - Has a personal history of biopsy-proven benign breast disease, V15.89;
  - Has a mother, sister, or daughter who has had breast cancer, V16.3; or
  - Has not given birth prior to age 30, V15.89

- Medicare will not pay for a screening mammography performed within 23 months following the month in which a previous screening mammography was performed if the above criteria do not apply (that is, the woman is not at high risk of developing breast cancer).

- For an asymptomatic woman over 49, but under 65 years of age (ages 50 thru 64), do not pay for a screening mammography performed within 11 months following the month in which a previous screening mammography was performed.

- For an asymptomatic woman over 64 years of age, do not pay for a screening mammography performed within 23 months following the month in which a previous screening mammography was performed.

Eligibility for Medicare and the screening mammography benefit generally begins at age 65, but certain individuals under 65 who are disabled are also eligible.

Billing Instructions: Claims should be submitted with the appropriate diagnosis. The screening mammography center/supplier must be listed

on the Screening Mammography Cert File. The referring physician must be listed on the claim. Screening mammography claims have a specific code that differentiates them from diagnostic mammography claims. Providers must submit CPT 76092 when billing Medicare B for reimbursement of a screening mammogram.

Please refer to attached chart to help determine whether payment for mammography screening is applicable.

The Clinton Administration has just unveiled its plan for health system reform and parts of it have us concerned. We're concerned that this plan will keep your doctor from giving you the personalized care you deserve. We're concerned that limits to what your doctor can do for you will be controlled by bureaucrats.
We do think this plan is a good place to start. It includes a lot of things we've been pushing for from the beginning. Like health insurance for everyone and a requirement that employers must help pay for it. But it still has a long way to go.
That's why the 300,000 member physicians of the American Medical Association (AMA) are insisting that any final reform legislation put the health of our patients first. This plan not only involves billions of dollars.
It involves millions of lives.
And all of us must remember which is most important.
This is the moment of truth.
This is indeed the moment of truth for America's health care system. And now is the time to voice your concerns... before this plan becomes law. Find out where your doctor stands and let him or her know what you think. And for more information on health system reform, write the AMA, Department 4111, 515 North State St., Chicago, IL 60610 or call 800 348-3047.

The Hospital Medical Staff Section
22nd Assembly Meeting
December 2 - 6, 1993
Hyatt Regency
New Orleans

HMSS representatives won't want to miss this year's AMA-HMSS Interim Assembly Meeting. They will have an opportunity to learn about and discuss with AMA's leadership and staff the details of President Clinton's health care reform proposal as well as AMA's legislative strategy.

HMSS representatives will also be presented with an overview of physician and physician/hospital organizations, including the physician hospital organization, management services organizations, the foundation and physician equity models, and the hospital-affiliated professional corporation.

Review and analysis of President Clinton's Health Care Reform Plan

President Clinton released his new health care reform plan in September. HMSS representatives in this session will hear a full review and analysis of the plan.

Physician Organizations & Hospital Organizations

Henry E Golembesky, MD, director of Integrated Health Systems Practice of American Practices Management and former chief executive officer of UniMed America, will discuss and examine, from a physician's perspective, the advantages and disadvantages of the organizational structures being created in response to federal, state, and business health care reform initiatives. He also will identify the key elements of successful physician and physician/hospital organizations.

Dr Golembesky will be joined by several physicians who currently practice in these structures. They will share their experiences and cite the challenges and opportunities for physicians. HMSS representatives will be able to ask questions of the physician panelists and together explore mechanisms to maintain physician control in the credentialing of network providers, the monitoring and assessment of patient care, and the setting of quality of care standards/outcomes.

Don't miss this opportunity to acquire leadership skills to help your physician community succeed!

(R-CA, 21st CD)

Now is the time for direct dialogue with members of the Administration and Congress. And now, the American Medical Association (AMA) brings you the *Physicians' Forum: Agenda for Action,* an unprecedented opportunity for every physician to interact with policy makers and help shape the way health care will be delivered.

Speak face to face with Congressional leaders, Presidential advisors and top Administration officials on the political pressures that will ultimately form health care policy. Help ensure that patients' needs remain the focus of reform. Hear governors and heads of state health departments describe how their states are preparing for a new national policy.

The Physicians' Forum series of conferences invites all physicians, not just AMA members, to join the dialogue on issues vital to their practices. Physicians, board members and officers of the AMA will come together to reach common ground.

Voice your concerns about the coming changes. Do not wait passively for those changes to be imposed without your input. The *Physicians' Forum* is the time and place to speak out and make an impact.

Your attendence is crucial.
Call toll free 800 621-8335.
Conference fee for meeting facilities and food service—AMA members $50, nonmembers $125. MasterCard, Visa, American Express, Optima are accepted.

Medical
and Chirurgical Faculty
of Maryland

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

  Checklist

  - ☐ Original manuscript and one copy.
  - ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
  - ☐ Everything double-spaced.
  - ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
  - ☐ Abstract of 100 to 300 words.
  - ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Miscellaneous meetings

International liver symposium, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 14 Cat 1 AMA/PRA credits. Fee: $350. Info: Hattie Johnson, 202-687-8735. — **Oct. 1–3**

Clinical cardiac electrophysiology, pacemakers, and cardioverter-defibrillators, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 4–7**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Oct. 7**

Psycho-economics: Clinical psychiatry and health care reform in the '90s, sponsored by the American Psychiatric Association, in Baltimore, Maryland. 34 Cat 1 AMA/PRA credits. Info: 202-682-6174. — **Oct. 8–12**

Gastroenterology board review course, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 42 Cat 1 AMA/PRA credits. Fee: $650 physicians; $500 residents and fellows. Info: Daniel E. Reichard, 202-994-4285. — **Oct. 9–13**

Medical oncology board review course, sponsored by the George Washington University, at the Ritz-Carlton, Pentagon City, Virginia. 38 Cat 1 AMA/PRA credits. Fee: $695 physicians; $500 residents and fellows. Info: John F. Vargo, 202-994-4285. — **Oct. 9–13**

Miscellaneous meetings (continued)

Clinical applications of Doppler and transesophageal echocardiography, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 14–16**

New techniques and concepts in cardiology, sponsored by the American College of Cardiology, at the Hyatt Regency Hotel, Washington, DC. 16 Cat 1 AMA/PRA credits. Info: 1-800-257-4739. — **Oct. 21–23**

Nuclear cardiology: A case study approach, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 21–23**

Cancer in women conference, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 21 & 28 and Nov. 4 & 11**

Vascular radiology conference, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 23**

Maryland Academy of Family Physicians regional mini conference, at the Tidewater Inn, Easton, Maryland. 6 Cat 1 AMA/PRA credits; 6 AAFP prescribed hours. Fee: $55 members; $75 nonmembers; $35 paramedicals; no charge for residents, medical students, MAFP retired and life members. Info: William Jones, 410-747-1980. — **Oct. 23**

7th annual national disability management conference and exhibit, sponsored by the Washington Business Group on Health, at the Crystal Gateway Marriott, Arlington, Virginia. Info: Kristina Tanasichuk, 202-408-9320. — **Oct. 25–26**

Topics in clinical rheumatology: An arthritis update for internists, family practitioners, orthopaedists, rheumatologists, other primary care practitioners, and allied health professionals, sponsored by the Arthritis Foundation, Maryland Chapter, at the Stouffer Harborplace Hotel, Baltimore, Maryland. Cat 1 AMA/PRA credits available. Fee: $50. Info: J. Karen Krug, 410-602-0160. — **Oct. 28**

Cases in echocardiography: TEE, Doppler and stress—Interpretation and clinical decision making for the advanced echocardiographer, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Oct. 28–30**

Cardiology in women, at the Greater Baltimore Medical Center (GBMC), Baltimore, Maryland. Info: Celeste Morrissey, 410-828-3670. — **Oct. 29**

The future of integrated health care systems conference, sponsored by The Health Care Forum and Inova Health System, at the Hyatt Regency, Reston, Virginia. 13.25 Cat 1 AMA/PRA credits. Info: 415-421-8810. — **Nov. 8–11**

Cardiac auscultation for physician assistants, nurse practitioners, and cardiac nurses, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. — **Dec. 1–3**

Fourth annual maternal and child health update, cosponsored by the Maryland Department of Health and Mental Hygiene, and the Maryland Coalition for Healthy Mothers and Healthy Babies, at the University of Maryland College Park Adult Education Center, College Park, Maryland. Info: 1-410-225-6726. — **Dec. 3**

Miscellaneous meetings (continued)

Twenty-first annual Williamsburg conference on heart disease, sponsored by the American College of Cardiology, in Williamsburg, Virginia. 19 Cat 1 AMA/PRA credits. Info: 1-800-257-4739. **Dec. 5–8**

Advanced echocardiography: Case studies and concepts, sponsored by the American College of Cardiology, at the Heart House Learning Center, Bethesda, Maryland. Info: 1-800-257-4737. **Dec. 13–15**

Med Chi 1994 annual meeting, at the Ramada Convention Center, Hagerstown, Maryland. Cat 1AMA/PRA credits available. Info: Vivian Smith, 410-539-0872 or 800-492-1056. **May 12–14, 1994**

Continuously throughout the year

Fluorescein angiography conference, sponsored by the Retina Center, St. Joseph Hospital, Baltimore, Maryland, first and third Mondays of each month; 8:00-9:00 am. Fee: none. Info: R. Classon, 410-337-4500.

PHYSICIAN'S RECOGNITION AWARD

During July and August 1993, the physicians listed below received the American Medical Association (AMA) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

The experience of a nationwide laboratory.

Wouldn't it be great if you could enjoy all the advantages of a nationally—accredited testing laboratory—right here in your own neighborhood? Well, now you can.

- The nation's largest full-service clinical laboratory network
- Over 25 years experience in laboratory toxicology
- Accredited by the College of American Pathologists (CAP)
- Licensed by the U.S. Department of Health and Human Services
- Local courier network works on your schedule around the clock
- 24-hour turnaround time on most routine tests
- Extensive internal quality control program ensures the accuracy you need to prescribe proper treatment for your patients
- A commitment to serve and serve well

Have You Seen our Videotapes?

A videotape, *Finding Strength: A Look at the Pediatric Branch,* is available to health care professionals and families interested in learning more about programs and research protocols at the Branch. Also available are two videotapes for health care professionals working with HIV-infected children and their families: *Conducting an HIV Parent Support Group* and *I Need a Friend: Kids Talk About the AIDS Virus.*

Or Would You Like to Schedule a Speaker?

If you plan to show the tape at a meeting of health professionals or other interested persons, we would be happy to arrange for a staff member to attend the showing and conduct a follow-up question and answer session. To schedule a presentation or order tapes, call Molly Matthews at (301) 951–1104.

For patient referral or information, contact: Philip Pizzo, M.D.
Chief, Pediatric Branch, National Cancer Institute, Bethesda, Maryland 20892 • (301) 402-0696

Call for Papers

1994 International Conference on Physician Health
September 16-20, 1994. Ottawa, Ontario, Canada

"Stress: The Profession, the Family and You"

The 1994 International Conference on Physician Health, co-sponsored by the American Medical Association, the Federation of State Medical Boards, the Canadian Medical Association, and the Federation of Medical Licensing Authorities of Canada is scheduled for September 16-20, 1994, at the Ottawa Westin Hotel.

Ottawa is Canada's capital and offers many national museums, over 60 miles of bicycle paths, hiking in Gateneau park, squash courts and swimming at the hotel and golf nearby.

The conference will provide a forum for practitioners and researchers to present recent findings and innovative treatment and education programs in physician health. This conference will address a range of issues, such as AIDS, HIV, problems related to aging, mental illness, substance abuse and physical disabilities and limitations, including those caused by general medical conditions. Possible topics for presentation include: presentation and treatment of health problems among physicians, the impact of disorders on physicians' families and practices, medical-legal issues facing hospital administrations and licensing boards, and material on health promotion and disease prevention. *Abstracts which address issues related to these topics (i.e., prevention, diagnosis, treatment, rehabilitation), but not dealing specifically with physicians are also welcome.*

Three types of presentations regarding these physician health issues are invited:

- **Poster Presentations**
  Written presentations of data-based research, epidemiological research, or program descriptions.

- **Paper Sessions**
  Oral presentation of scientific, data-based findings relative to the topic of physician health.

  Abstracts for poster presentations and paper sessions should contain an introductory statement on the significance of subject matter. Description of methods, results, and conclusions should follow the introductory statement.

- **Workshops**
  Training or instructional presentations, designed to improve specific skills of persons who work in the area of physician health.

  Abstracts for workshops should contain information on the program's intended audience, goals, teaching strategies, and materials. Evaluation data should be summarized

Abstracts may not exceed 200 words. Any abstracts exceeding that length will be rejected. Abstracts should be typed, double spaced, and mailed (not faxed). Four copies of the abstract should be sent, along with one self-addressed, stamped envelope. All submissions must list the primary and secondary authors and their professional affiliations. Telephone number and address of primary author must also be included.

Submissions *must* be received by February 1, 1994.

Abstracts will be submitted for blind review. Abstracts will be judged on their applicability to the conference topic area and their scientific merit. The decisions of the blind reviewers will be communicated to the abstract's primary author by April 1, 1994.

All presenters are expected to register for the conference at the AMA member rate. We are unable to provide any financial support for presenters. Presenters will also be responsible for their own transportation and hotel expenses, as well as making all reservations for same.

Send all materials to:
Elaine M. Tejcek, Physicians Health Foundation, American Medical Association, 515 N. State Street, Chicago, IL 60610.

American Medical Association
Physicians dedicated to the health of America

Physicians, Residents, and Medical Students:

Do You Know How to Protect Your Finances Against HIV?

FACT> HIV Infection Puts You at Financial as Well as Physical Risk.

As a medical professional, you take precautions to safeguard yourself physically from the threat of HIV infection. But have you taken precautions financially? The inability to earn an income and the depletion of your assets are two hurdles you would have to overcome should you become infected with HIV.

FACT> Traditional Insurance Was Not Designed to Provide Financial Protection Against HIV Infection.

You may have protected yourself with adequate amounts of life, health, and disability insurance. But while each of these coverages offers valuable protection, none was designed to protect against the financial consequences of HIV infection.

FACT> This HIV Indemnity Plan is a Solution to the Unmet Need for Financial Protection.

This unique HIV Indemnity Plan plan pays a lump-sum benefit upon first-time diagnosis of HIV seropositivity, giving you the help needed to replace lost income, protect assets, and cover the cost of HIV treatment.

Request FREE, no-obligation information about this HIV Indemnity Plan. Complete and return the coupon below or call the AMA Insurance Agency toll-free at : 1-800-458-5736 Monday — Friday, 9:00 a.m. — 4:45 p.m. (Central Time).

Prevention and Control of Influenza

Influenza in Maryland 1992 - 1993

During the 1992-93 influenza season (October 1992 through May 1993) a total of 47 influenza isolates were reported to the Maryland Department of Health and Mental Hygiene (DHMH). Because most cases of influenza are not confirmed by culture or serology, and because influenza is not a reportable disease in Maryland, this is assumed to represent a small fraction of the actual number of influenza cases. Twenty-eight (60%) were influenza A and 19 (40%) were influenza B. Seven of the influenza A isolates were sent to the Centers for Disease Control and Prevention (CDC) for subtyping and all seven were identified as influenza A/Beijing/32/92-like (H3N2) viruses. This strain is different than the A(H3N2) component that was included in the 1992-93 influenza vaccine. The greatest number of isolates (8) came from Baltimore City and the remaining 39 isolates came from 12 of Maryland's 23 counties. Forty of the 47 reports noted the case's age: 25 (63%) were from persons greater than 65 years of age. The peak weeks of influenza activity as evidenced by collection dates for culture positive specimens were from February 14, 1993 through March 27, 1993. This peak in activity was approximately eight weeks later than the peak during the 1991-92 season. The mean time of reporting positive culture results to the local or state health department was approximately 11 days after specimen collection.

During the 1992-93 influenza season, Maryland had 17 reported outbreaks of culture-confirmed influenza and 55 reported outbreaks of influenza-like illness (ILI). Of the 17 confirmed influenza outbreaks, 8 were due to influenza A, 7 were due to influenza B, and 2 were mixed influenza A and B. No other respiratory viruses were isolated from patients associated with either influenza or ILI outbreaks. All 17 influenza outbreaks were reported between February 21 and March 27. All 55 of the reported ILI outbreaks occurred in nursing homes as did 16 (94%) of the 17 cultured-confirmed influenza outbreaks. At least 130 hospitalizations and 28 deaths occurred during the 71 outbreaks in nursing homes.

Reports of excess school absenteeism due to influenza-like illness decreased significantly from that reported during the 1991-92 influenza season (30 versus 128, respectively).

Influenza Vaccine 1993-1994

The following three pages contain the "official" *Important Information Statement* (IIS) for the 1993-94 influenza vaccine as well as the *Vaccine Administration Record*. Please reproduce these for your office use or contact the Immunization Division, DHMH, for additional copies at (410) 225-6679. The IIS contains a brief summary of the recommendations for the use of the 1993-94 influenza vaccine and is intended to provide information to the vaccine recipient (or parent or guardian). The complete text of the Advisory Committee on Immunization Practices (ACIP) recommendations can be found in *Morbidity and Mortality Weekly Report* (MMWR 1993;42[No. RR-6]:1-14). A copy of these recommendations can also be obtained from the Division of Immunization. ACIP recommendations for the use of amantadine are expected to be published later this fall in the MMWR.

IMPORTANT INFORMATION ABOUT INFLUENZA AND INFLUENZA VACCINE, (1993-1994)

Please read this carefully!

WHAT IS INFLUENZA ("FLU")?

Influenza (or "flu") is a viral infection of the nose, throat, bronchial tubes, and lungs that can make someone of any age ill. Usually the flu occurs in the United States from about November to April. If you get the flu, you usually have fever, chills, cough, and soreness and aching in your back, arms, and legs. Although most people are ill for only a few days, some persons have a much more serious illness and may need to go to the hospital. On average, thousands of people die each year in the United States from the flu or related complications.

WHO SHOULD GET INFLUENZA VACCINE?

Because influenza is usually not life threatening in healthy individuals and most people recover fully, health officials emphasize the use of vaccine for the elderly and people with other health problems which make these individuals more likely to be seriously ill or to die from the flu or its complications. For example, people who after even light exercise become short of breath due to diseases affecting their heart or lungs, and people who have low resistance to infections, are likely to be more seriously affected by the flu. Thus, the following groups are at increased risk for serious illness with the flu and should receive vaccine:

- All people 65 years of age or older.
- Adults and children with long-term heart or lung problems which caused them to see a doctor regularly, or to be admitted to a hospital for care during the past year.
- Residents of nursing homes, and other institutions housing patients of any age who have serious long-term health problems.
- People of any age who during the past year have regularly seen a doctor or have been admitted to a hospital for treatment for kidney disease, cystic fibrosis, chronic metabolic disease such as diabetes, anemia ("low blood"), or severe asthma.
- People who have a type of cancer or immunological disorder (or use certain types of medicines) that lowers the body's normal resistance to infections. (Because influenza might cause serious illness and complications in persons infected with the HIV virus which causesAIDS, these individuals should receive influenza vaccine.)
- Children and teenagers (6 months through 18 years of age) on long-term treatment with aspirin who, if they catch the flu, may be at risk of getting Reye syndrome (a childhood disease that causes coma, liver damage, and death).

Medical staff in health-care facilities should be vaccinated, to reduce the possibility that high-risk patients might catch the flu when receiving medical care. Family members or others who provide care to high-risk persons at home should also be vaccinated. The possibility for spreading the flu to high-risk persons can be reduced by vaccinating:

- Doctors, nurses, and other personnel in both hospital and outpatient care settings.
- Personnel of nursing homes and chronic-care facilities who have contact with patients or residents.
- Individuals who provide care to high-risk persons at home, such as visiting nurses and volunteers, as well as all household members, including children, whether or not they are providers of care.

In addition, a flu shot may be given to:

- Persons wishing to reduce their chances of catching the flu.
- Persons who provide essential community services.
- Students or other persons in schools and colleges if outbreaks would cause major disruptions of school activities.

U.S. DEPARTMENT OF HEALTH & HUMAN SERVICES
Public Health Service
CDC
CENTERS FOR DISEASE CONTROL AND PREVENTION

- Persons traveling to the tropics at any time of the year or to countries south of the equator during April - September. (Persons with high-risk medical conditions and those ages 65 and older who are traveling as indicated above especially should be encouraged to receive vaccine.)

INFLUENZA VACCINE:

The viruses that cause flu frequently change, so people who have been infected or given a flu shot in previous years may become infected with a new strain. Because of this, and because any immunity produced by the flu shot will possibly decrease in the year after vaccination, persons in the high-risk groups listed above should be vaccinated every year. This year's flu shot contains viruses representing the A/Texas/36/91 (H1N1), A/Beijing/32/92 (H3N2), and B/Panama/45/90 strains, which are thought to be most likely to occur in the United States next winter. All the viruses in the vaccine are killed so they cannot infect anyone. Vaccine will begin to provide its protective effect after about one or two weeks, and immunity may decrease, on average, after several months. Flu shots will not fully protect all persons who get them against the flu. They also will not protect against other illnesses that resemble the flu.

DOSAGE:

Only a single flu shot is needed each season for persons 9 years of age and older, but children less than 9 years of age may need a second shot after a month. The doctor or nurse giving the flu shot will discuss this with parents or guardians. Children less than 13 years old should be given only vaccine that has been chemically treated during manufacture (split virus) to reduce chances of any side effects. Split-virus vaccines can also be used by adults.

POSSIBLE SIDE EFFECTS FROM THE VACCINE:

Most people have no side effects from recent influenza vaccines. Flu shots are given by injection, usually into a muscle of the upper arm. This may cause soreness for a day or two at the injection site and occasionally may also cause a fever or achiness for one or two days. Unlike the 1976 swine flu vaccine, recent flu shots have not been clearly linked to the paralytic illness Guillain-Barré syndrome (GBS). In 1990-91 there may have been a small increase in GBS cases in vaccinated persons 18 to 64 years of age, but not in those ≥ 65 years. This possible association with GBS was not as convincing as with the swine flu vaccine. Even if GBS were a true side effect, the very low estimated risk of getting GBS is less than that of getting severe influenza that could be prevented by vaccine. As is the case with most drugs or vaccines, there is a possibility that allergic or more serious reactions, or even death, could occur with the flu shot.

SIMULTANEOUS USE OF OTHER VACCINES:

The target group for influenza and pneumococcal vaccination overlap. Both vaccines can be given at the same time at different sites without increasing side effects. High-risk children may also receive influenza vaccine at the same time as measles, mumps, rubella, *Haemophilus influenzae* type b, pneumococcal, poliovirus vaccines, diphtheria and tetanus toxoids, and pertussis adsorbed and acellular pertussis vaccines, but at different sites.

WARNING! SOME PEOPLE SHOULD CHECK WITH A DOCTOR BEFORE TAKING INFLUENZA VACCINE:

- Persons with an allergy to eggs that causes a dangerous reaction if they eat eggs and those who have had a serious reaction to previous influenza vaccination should consult a physician before receiving the vaccine.

- Anyone who has ever been paralyzed with Guillain-Barré syndrome should seek advice from their doctor about special risks that might exist in their cases.

- Women who are or might be pregnant should consult with their doctor.

- Persons who are ill and have a fever should ask their doctor whether or not they should delay vaccination until the fever and other temporary symptoms have gone.

QUESTIONS:

If you have any questions about influenza or influenza vaccination, please ask now or call your doctor before requesting the vaccine.

REACTIONS:

If anyone receiving influenza vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after vaccination, please report this to:

VACCINE ADMINISTRATION RECORD

The doctor or clinic may keep this record in your medical file or your child's medical file. They will record what vaccine was given, when the vaccine was given, the name of the company that made the vaccine, the vaccine's special lot number, the signature and title of the person who gave the vaccine, and the address where the vaccine was given.

"I have read or have had explained to me the information in this pamphlet about influenza and influenza vaccine. I have had a chance to ask questions that were answered to my satisfaction. I believe I understand the benefits and risks of influenza vaccine and ask that the vaccine be given to me or to the person named below for whom I am authorized to make this request."

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872
1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements for physician placements in the classifed advertisements are charged at the regular classified advertising rate.

Doctors Planning to Relocate →

If you are moving or planning to, let us know so that you won't miss a single issue of the *Maryland Medical Journal*. Fill out the form to the right and mail it to:

Wanda Griebel, MMJ
1211 Cathedral St.
Baltimore, MD 21201-5585
or call 410-539-0872 or
1-800-492-1056 or
fax it to 410-547-0915.

Malpractice Insurance

Not the most popular topic among physicians.

That's why many Maryland doctors turn to the Med Chi Agency team to obtain coverage that makes sense and affords the peace of mind needed to focus on what *really* interests them—their practice and their patients.

Started by doctors with doctors in mind, we at the Med Chi Agency know what physicians want and what physicians need when it comes to professional liability insurance.

Security. Competence. Proven Leadership.

The Med Chi Agency

Because we specialize in medicine too.

Straight Talk. Doctor-To-Doctor.

When you're tired of playing games with risk retention groups or insurance companies, we'll be glad to give you the straight talk you need to make your best choices.

Straight talk about coverage options, premium discounts, free retirement coverage, risk management programs, and all the kinds of choices doctors really need.

Where did we learn to talk like this? Simple. We're run by doctors, and doctors are too busy to play games.

To learn more about joining the thousands of your physician colleagues insured by Medical Mutual, call us at 1-800-492-0193.

Doctor-to-doctor. What better way to hear it straight?

Investment Counsel Group

YOU DON'T HAVE TO PUT OFF UNTIL TOMORROW WHAT YOUR FAMILY DESERVES TODAY.

RIVER FALLS
Potomac's Family Community.

Right now, the design, the quality and the unique lifestyle of a River Falls home are an all-time best buy. This new generation of Gosnell-built homes are designed with every amenity and offer floor plans that make living easy plus offer the opportunity to customize to your family's lifestyle.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Three, four and even five bedroom homes start in the $600's with absolutely no compromise in quality. There's still terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go beyond the dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities
- Highly regarded public and private schools

Where else can you get such a sound investment with such outstanding returns? Come see it now.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.

1993-1994 Med Chi Membership Directory

The *1993-1994 Med Chi Membership Directory* was mailed to all active Med Chi members with this November 1993 issue of the *Maryland Medical Journal*. If your membership status is emeritus, emeritus-at-large, affiliate, associate, student, or resident, you can request a free copy of the directory by calling Wanda Griebel at 410-539-0872 or 1-800-492-1056. The directory is available to non-Med Chi members for $250 plus postage.

IRS Issues Guidance on Nondeductible Lobbying Expenses

From the American Society of Association Executives (ASAE) Government Affairs department. The Internal Revenue Service (IRS) issued guidance (IR-93-98) to associations on how to treat dues that an association **assesses or receives before 1994** that are allocable to nondeductible lobbying and political expenditures. The IRS also issued transition rules (Notice 93-55) that will appear in the *Internal Revenue Bulletin* 1993-35, dated November 8, 1993.

The transition rules offer three options for an association. You may (1) provide your members with notices setting forth a reasonable estimate of the portion of the dues that are not deductible; (2) pay the proxy tax on the amount of dues actually allocable at the highest corporate rate—35% (the timing and method for this payment has not yet been determined); or (3) increase your "reasonable estimate" of dues allocable to nondeductible lobbying and political expenditures for 1995 by the amount of the actual 1994 expenditures.

Following a meeting with IRS and treasury department officials, Edward T. Coleman, Esq., of Webster, Chamberlain & Bean, and the ASAE Task Force on Lobbying Tax Regulations chairperson, said, "an association with a noncalendar fiscal year that includes part of 1994 must comply **now** with the recently enacted law affecting the nondeductibility of lobbying expenses."

There are many unanswered questions and concerns. Watch for the temporary regulation that the IRS will be issuing in the next few months.

New Medicare Policy

For services rendered on or after October 30, 1993, the physician can bill the patient for noncovered visit services provided as part of a routine physical examination. The physician should use the preventive medicine service codes (99381–99379) to report these services. Also, the physician may continue to bill the patient for noncovered procedures (e.g., routine chest x-ray).

For covered visit services, the physician bills Medicare; payment is the lesser of the physician's actual charge or the Medicare approved amount if the physician accepts assignment. If the physician does not accept assignment, payment is the lesser of the physician's actual charge or the physician's limiting charge. The physician's charge to the patient for the noncovered portion of the E&M (evaluation and management) service is the difference between the physician's usual fee for a routine physical exam and his/her **usual** fee (not the allowed amount) for the covered visit.

The physician is not required to notify the patient in advance that the physical exam is a noncovered service because the basis of the noncoverage is a specific statutory exclusion.

Medicare Update

Effective January 1, 1994, EKG (electrocardiogram) interpretations performed in conjunction with visits will be reimbursed by Medicare, and the new physician reductions in reimbursement will be abolished.

Blue Cross/Blue Shield of Maryland Medicare Update

Mammograms. When referring patients for mammograms, document on the requisition form whether it is screening or diagnostic and unilateral or bilateral. During 1992, Maryland Medicare's billing for diagnostic mammograms was 9% higher than the national average.

Assignment decisions. The HCFA 1500 claim form is a legal document and cannot be changed or canceled by the provider after the claim is processed and both parties (physician processed and beneficiary) have been notified.

Waiver of liability. This waiver must be given to patients when services may be denied as "not medically necessary," and it must be specific to the service being provided, be signed by the patient prior to the service, and a copy must be given to the patient.

Electronic billing. Medicare provides free software for billing Medicare claims. Call 410-561-4277 for more information.

Flu shots. Flu shots are covered as of May 1, 1993. Bill 90724 and Q0124 for flu shot and administration. The allowance is $3.38 for 90724 and $2.67 for Q0124.

Effective October 1, 1993, interest will not be paid until the 31st day on clean claims.

Effective January 1, 1994, separate payment will be made for the interpretation of EKGs (electrocardiograms), and the new physician and practitioner limits will not apply for 1994 services.

Revised payments to anesthesia teams. The allowance for the team (physician and CRNA [certified register nurse anesthesist] or AA [anesthesist assistant]) will not exceed 125% of the allowance for a personally performed service. The allowance will be decreased 5% each year until 1998 when the payment will be the same for a team or an individual anesthesiologist.

The 1994 version of ICD-9-CM diagnosis codes must be used by all providers for claims received January 1, 1994, and after. Claims will be denied for incorrect diagnosis and diagnosis not brought out to the highest level of specificity.

The update factors for the 1994 medical fee schedule are: 1.1010 surgery = 10%; 1.0540 nonsurgery = 5.3%; and 1.0080 primary care = 7.9%.

Self-Referral

Effective December 31, 1994, a physician cannot refer Medicaid/Medicare patients to entities providing the following services if the physician has a financial interest in the entity: clinical lab; radiology or other diagnostic lab; physical or occupational therapy; durable medical equipment; radiation therapy; parenteral/enteral nutrients; equipment and supplies; prosthetics, orthotics, or prostheses; home health; outpatient prescription drugs; and inpatient and outpatient health services. This prohibition does not apply to physicians who have their own in-office lab.

Lifetime Signature Authorization

A physician may obtain life-time signature authorizations from Medicare patients and submit subsequent claims on an assigned or unassigned basis by entering "Signature on File" in block 12 of the HCFA 1500 claim form.

For participating physicians who submit to Medicare, bills that automatically crossover and are paid by a Medigap carrier, life-time signature authorizations for assignment of Medigap benefits can be obtained if carrier specific. In order to inform Medicare that a patient has agreed to the assignment of Medigap benefits, "Signature on File" must be entered in block 13 of the HCFA 1500 claim form.

For any entry of "Signature on File," the patient or the patient's representative must sign and date an authorization statement.

Maryland Blue Cross/ Blue Shield—Medicare

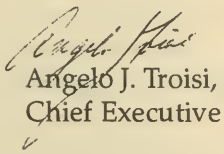
Following this newsletter are revised medical policies expanding Medicare's coverage guidelines for epidural opiate analgesia and clarifying the policy on acute postsurgical intravenous patient-controlled analgesia. The policy on epidural opiate analgesia has been revised to allow one daily pain management hospital visit for up to four days immediately following the catheter placement.

Statewide Substance Abuse Education Program Initiated

On October 1, 1993, Med Chi, with support from the Governor's Drug and Alcohol Abuse Commission, initiated a statewide substance abuse education program. The program focuses on screening, counseling, and referring substance-abusing patients. It will be offered to Maryland's primary care physicians as both a continuing medical education course and in a self-study guide format. Courses are already being set up throughout the state. For more information about the program, or to schedule a presentation, please call Carmine M. Valente, Ph.D., at 410-539-0872 or 1-800-492-1056.

Physician Rehabilitation Committee Is Holding its Fourth Annual Conference on Addiction

The Fourth Annual Conference on Addiction is being held Saturday, December 11, 1993, at the Sheraton International Hotel BWI Airport from 7:30 a.m. to 6:00 p.m. Topics will include the biomedical aspects of addiction, nicotine addiction, the nature and present status of drug abuse treatment, the need for greater access to treatment, the future of drug control policy in America, helping the helpers, and use and abuse of heroin and other opioids.



Registration fees are $60, Med Chi members; $100, nonmember physicians/Ph.D.; $40, allied health professionals; and no charge for medical students or medical residents. (Fee includes buffet lunch.) For additional information, see page 1137 of this *Maryland Medical Journal,* or call 410-962-5580 or 1-800-992-7010.

Study Group for Alternative Medicine

"Alternative Medicine in an Academic Hospital Setting" will be the topic of a talk by Brian Berman, M.D., at the second meeting of Med Chi's Study Group for Alternative Medicine. Dr. Berman is assistant professor of anesthesiology and family medicine at the University of Maryland Medical Center and director of the Laing–University of Maryland at Baltimore Complementary Medicine Project. The meeting will be held at Med Chi on January 19, 1994, at 7:00 p.m. Please call Steve Jones at Med Chi at 410-539-0872 or 1-800-492-1056 or Hiroshi Nakazawa, M.D., at 410-644-1502 if you wish to attend or receive additional information.

1994 Med Chi Annual Meeting

Plan to attend the 1994 Med Chi Annual Meeting being held Thursday, May 12 through Saturday, May 14, 1994, at the Ramada Inn and Convention Center in Hagerstown, Maryland. The theme of the meeting is "Medicine Under Health System Reform—Impact on Patients and Physicians." Watch the *Chief Executive Officer's Newsletter* for more information.

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

What is the status of the Comprehensive Standard Health Benefit Plan mandated by the Maryland Health Care and Insurance Reform Act of 1993 (HB 1359)?

On November 4, 1993, the Standard Benefit Task Force of the Health Care Access and Cost Commission (HCACC) presented the HCACC with the task force's report on the proposed standard benefits plan for Maryland small employers. In developing the standard benefit plan, the task force was required to set the total value of the plan's benefits between a statutory floor and ceiling.

The plan's floor was established by HB 1359 as the actuarial value of mandatory benefits for federally qualified health maintenance organizations (HMOs). According to estimates by the task force's actuarial consultant, A. Foster-Higgins & Co., Inc., the actuarial value was set at $2,997. The plan's ceiling, as established by HB 1359, could not exceed 12% of the average annual wage in Maryland, which was estimated to be approximately $3,500 for the calendar year ending December 31, 1994. However, the task force subsequently lowered the plan's ceiling to $3,078, ostensibly to allow the plan's rates to stay in effect for a three-year period during which annual medical inflation was projected to be 11.2% and wages were projected to increase only 4% annually.

The task force's report contains four different delivery systems—indemnity, preferred provider organization, point-of-service, and health maintenance organization— through which the proposed standard benefits plan can be provided. Although the health services offered are identical, the deductibles and co-payments of the standard benefits package is significantly different for each delivery system. Insurance carriers that offer insurance to small employers (2-50 employees) must offer the standard benefit plan beginning July 1, 1994; however carriers will **not be required** to offer every type of delivery system.

Through a letter dated November 4 and oral testimony presented to the full HCACC on Friday, November 19, 1993, Med Chi expressed its concern regarding the methodology used in pricing the plan and about benefits excluded from the plan. For the November 19 HCACC hearing, Med Chi organized a panel that included Med Chi, the Johns Hopkins University School of Medicine, the Johns Hopkins Health System, the University of Maryland School of Medicine, and Blue Cross and Blue Shield of Maryland to present common views to the HCACC. Although these parties did not agree on all things, they agreed on certain things and several HCACC members commented favorably on the presentation.

On December 2, 1993, the HCACC gave preliminary approval to a revised standard benefit plan which incorporated several changes proposed by Med Chi. The HCACC is expected to give final approval to the plan after a 45-day public comment period early next year. Med Chi's positions on the original proposed standard benefits package with the HCACC's responses are outlined below.

Organ transplants. The task force's report recommended that many organ transplants (e.g., heart, heart/lung, adult liver, autologous bone marrow) should be excluded. Med Chi objected to these exclusions, and **the HCACC agreed to provide full coverage for these transplants.**

Mammography screening. The task force's report recommended that screening mammography for women begin at age 50 and then occur subse-

quently every two years. Med Chi objected to the frequency of mammography after age 50 and to the exclusion of the 40 to 50 age group. **The HCACC agreed with Med Chi, and the plan will include screening mammographies for women between 40 and 50 (every two years) and for women over 50 (every year).**

Emergency services. The task force's report proposed a $50.00 co-pay for each emergency room visit. Moreover, this $50.00 did not count against any deductible. Med Chi and the Maryland Chapter of the American College of Emergency Physicians protested this fee and the fact that it would not be deductible. **The HCACC reduced the co-pay to $35.00 and determined that any payment would be applied against the deductible.**

Mental health coverage. Med Chi joined the Maryland Psychiatric Society and the Washington Psychiatric Society in suggesting that the 20-day limit on inpatient psychiatric care be increased to 30 days. **The HCACC increased the number of inpatient days to 25.**

Inpatient diagnostic testing. The task force's report excluded all inpatient diagnostic testing from coverage. Med Chi objected to this exclusion and cited procedures such as cardiac catherization that are routinely done in a hospital setting. **The HCACC responded by including inpatient diagnostic testing in the plan, subject to prior approval.**

Out-of-pocket limits. Med Chi expressed concern that the co-payments and deductibles under the non-HMO plans were too high and, therefore, would be unattractive to insurance companies and consumers alike. **The HCACC responded by setting the same out-of-pocket limits for the point of service plan (POS) and the preferred provider organization plan (PPO), thus relieving some of this concern.**

Med Chi is gratified by the HCACC's response to its public testimony and believes that its concerns have been accommodated.

Has the HCACC finalized any regulations regarding the provision in HB 1359 governing laboratory fees?

To date, the HCACC has not begun work on regulations governing laboratory fees, nor has there been any clarification regarding the "nominal fee" that physicians are permitted to add to a commercial laboratory's fee when the physician bills for the lab test. However, since 1973, *Health Occupations Article*, Maryland Code, section 14-404 (a) (16), provides explicit regulations about physicians' charges for lab tests. This law states that "a physician can be disciplined if a physician does not disclose on a bill to a patient or third party payer the name of the lab, the amount paid to the lab for the test or test series, and the amount of procurement or processing charge of the licensed physician for each specimen taken."

A more through discussion of the regulations and ethics concerning laboratory fees will be presented in the December *MMJ*.

Do you have a question regarding health system reform? Call Med Chi's Health System Reform Hotline 1-800-209-9126. Questions will be answered in subsequent *MMJ* issues.

Call for Papers

The Medical & Chirurgical Faculty of Maryland

requests papers on the theme

Medicine Under Health System Reform--Impact on Patients and Physicians

for the

1994 Annual Meeting

at the

Ramada Inn and Convention Center, Hagerstown, Maryland Thursday - Saturday May 12 - May 14, 1994

Med Chi invites papers dealing with "Medicine Under Health System Reform--Impact on Patients and Physicians" for consideration by the Med Chi Committee on Scientific Activity.

For more information, call the Med Chi Office of Continuing Education at 410-539-0872 or 1-800-492-1056.

Workers' Compensation: A physician survey

The members of the Med Chi Committee on Managed Care and Third-Party Liaison are interested in hearing from you regarding your experience with Workers' Compensation. If you did not have an opportunity to respond to this survey when it was published in the May 1993 MMJ, *please take a few minutes now to fill it out and send it back as soon as possible. Thank you.*

Please type or print ***clearly.***

---

1. In what type of medical setting do you practice? *(Check all that pertain.)*

   o Group o Solo o HMO o Other:_____

2. What is your specialty? *(Check all that pertain.)*

   o Family Practice o Internal Medicine
   o Orthopaedics o Surgery (subspecialty):_____
   o General Practiceo Neurology
   o Other:_____

3. If you **accept** Workers' Compensation cases, what percentage of your practice consists of Workers' Compensation cases? _____% (Go to question 5.)

4. If you **do not** accept Workers' Compensation cases, please explain why. (Go to question 15.)

Medical Policy

SUBJECT: **EPIDURAL OPIATE ANALGESIA**

EFFECTIVE DATE: **August 1, 1989**

REVISED DATE: **November 9, 1992**

REVISED DATE: **October 1, 1993**

CPT/HCPCS Code(s): **62279, 01996**

Description of Service: Epidural Opiate Analgesia is a therapeutic modality for the treatment of post-operative pain. Narcotics provided in this manner produce long-lasting pain relief. The expected results include decreased morbidity and mortality as well as decreased length of stay associated with improved post-operative pain management. This type of analgesia includes patient - controlled epidural analgesia (PCEA).

Clinical Indications: The insertion of the epidural catheter is covered when it is not used as the method of anesthesia during a surgical procedure. (The insertion of the epidural catheter for the purpose of administering anesthesia at the time of surgery is included in the anesthesia fee.) Coverage for epidural opiate analgesia is limited to the following:

- major thoracic, vascular, abdominal and orthopedic surgeries,
- major trauma cases,
- patients at high risk for development of pneumonia or thrombophlebitis.

Billing Instructions: When the catheter is inserted on the same date as the administration of surgical anesthesia, the claim must state that the catheter was not used as the method of administering the anesthesia. In the absence of this

statement, presumption is made that the method of anesthesia was through the epidural catheter and no additional reimbursement is available.

The anesthesiologist responsible for placement of the epidural catheter will be reimbursed under procedure code 62279. Procedure code 01996 should be used to bill for daily management of the epidural analgesia on days subsequent to the day of insertion of the epidural catheter.

One daily pain management hospital visit (01996) for this continuous type of treatment will be allowed for up to four (4) days immediately following the epidural catheter insertion. The date of the catheter placement must be shown on the claim.

CRNA's may bill for the daily pain management hospital visits (01996).

SECTION: Anesthesia

Medical Policy

SUBJECT:	**Acute Post-Surgical Intravenous (IV) Patient Controlled Analgesia (PCA)**
EFFECTIVE DATE:	**August 1, 1989**
REVISED DATE:	**November 9, 1992**
REVISED DATE:	**October 1, 1993**

CPT/HCPCS Code(s): **99251 - 99254, 99261 - 99263**

Description of Service: Intravenous (IV) Patient Controlled Analgesia (PCA) is an alternative to conventional post-operative pain control. It is a technique for post-operative pain management that involves self administration of intravenous drugs through an infusion pump.

Clinical Indications: When the anesthesiologist performs a consultative service evaluating and recommending appropriate dosage, lockout interval, and dose limits the service is included in the time units allowed for the anesthesia service. Under global surgery guidelines payment for physician services related to IV PCA is included in the global fee paid to the surgeon and is not separately reimbursed to an anesthesiologist.

Billing Instructions: There is no reimbursement to physicians for management of the patient controlled intravenous (IV) analgesia pump.

ANNOUNCING

Med Chi's 1994 Annual Meeting

Medicine Under Health System Reform–
Impact on Patients and Physicians

Thursday, May 12 – Saturday, May 14, 1994
Ramada Inn & Convention Center
Hagerstown, Maryland

Keynote Speaker
Robert E. McAfee, M. D.
President-elect
American Medical Association

We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1994 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, and see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

Doctor of the Day 1994

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 5:00 p.m. For more information, call Joyce Yensen at Med Chi's Legal Department, 410-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

Editorial

Gastroenteritis in nursing homes

The Maryland Department of Health and Mental Hygiene (DHMH) *Guidelines for Epidemiological Investigation of Gastroenteritis Outbreaks in Long-Term Facilities* defines an outbreak of gastroenteritis as "three or more residents from a single ward or unit or 3% or more of the entire facility who develop diarrhea or vomiting AND the onsets occur within a seven-day period." The *Code of Maryland Regulations,* 10.06.01.04, Reporting Procedures (for communicable diseases), states that nursing homes must report outbreaks "immediately by telephone to the health officer" and in writing to the health officer "within 48 hours."

Statistics from the DHMH Division of Outbreak Investigation show that there were 256 nursing home outbreaks of gastroenteritis reported in 21 jurisdictions in Maryland from 1988 through 1992 resulting in 8,364 cases of illness. Approximately 79% of these cases were nursing home residents and 21% were nursing home employees. A total of 105 people were hospitalized, and 26 died. In 78% of the outbreaks, the etiologic agent was listed as "undetermined, probably viral."

The number of hospitalizations and deaths from nonbacterial gastroenteritis can be reduced by taking preventive measures to control its spread. The importance of enteric precautions, especially wearing gloves and washing hands, cannot be overemphasized. Training sessions using videotapes or even simple verbal reminders to staff at their change of shift are beneficial during a gastroenteritis outbreak. Nursing home employees with diarrhea or vomiting should be excluded from patient care and food handling during acute illness and for two days after symptoms resolve.

Regulations and recommendations concerning bacterial enteric pathogens such as *Salmonella* and *Shigella* are covered in the *Code of Maryland*

Editorial

Regulations, 10.06.01 (communicable diseases), and in the DHMH *Guidelines for Epidemiological Investigation of Gastroenteritis Outbreaks in Long-Term Facilities,* available by calling 410-225-6677.

Details regarding a gastroenteritis outbreak in one nursing home are presented in an article by Emont et al beginning on page 1099.

Discover The Elegance Of A Hybrid

At first glance, it's the ***beauty*** of a rose that catches the eye. The vibrant color. The delicately shaped petals. But study it more closely, and its ***elegance*** becomes apparent—a gentle blend of softness and strength.

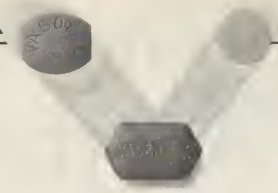
At first glance, it's the ***enhanced performance*** of Vaseretic that catches the eye. But study Vaseretic more closely, and its ***elegance*** becomes apparent. The way its one-tablet, once-a-day dosage minimizes multiple medications. Minimizes insurance copayments. And minimizes potassium supplementation.

A hybrid ***blending of tolerability and power*** that's available for the right patient. Vaseretic is indicated for the treatment of hypertension in patients for whom combination therapy is appropriate.

And an elegant discovery for your practice.

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, Vaseretic® (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*

VASERETIC® 10-25 *Next*
Enalapril Maleate-Hydrochlorothiazide



Dosage must be individualized; the fixed combination is not for initial therapy.

Evaluation of the hypertensive patient should always include assessment of renal function.

For a Brief Summary of Prescribing Information, see adjacent pages.

TABLETS
VASERETIC®
(ENALAPRIL MALEATE-HYDROCHLOROTHIAZIDE)

10 mg

25 mg

USE IN PREGNANCY: When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC (Enalapril Maleate-Hydrochlorothiazide) should be discontinued as soon as possible. See WARNINGS, *Fetal/Neonatal Morbidity and Mortality.*

CONTRAINDICATIONS: VASERETIC is contraindicated in patients who are hypersensitive to any component of this product and in patients with a history of angioedema related to previous treatment with an angiotensin converting enzyme inhibitor. Because of the hydrochlorothiazide component, this product is contraindicated in patients with anuria or hypersensitivity to other sulfonamide-derived drugs.

WARNINGS: *General; Enalapril Maleate; Hypotension:* Excessive hypotension was rarely seen in uncomplicated hypertensive patients but is a possible consequence of enalapril use in severely salt/volume depleted persons such as those treated vigorously with diuretics or patients on dialysis.

Syncope has been reported in 1.3 percent of patients receiving VASERETIC. In patients receiving enalapril alone, the incidence of syncope is 0.5 percent. The overall incidence of syncope may be reduced by proper titration of the individual components. (See PRECAUTIONS, *Drug Interactions*, and ADVERSE REACTIONS.)

In patients with severe congestive heart failure, with or without associated renal insufficiency, excessive hypotension has been observed and may be associated with oliguria and/or progressive azotemia, and rarely with acute renal failure and/or death. Because of the potential fall in blood pressure in these patients, therapy should be started under very close medical supervision. Such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart or cerebrovascular disease, in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident.

If hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses, which usually can be given without difficulty once the blood pressure has increased after volume expansion.

Angioedema: Angioedema of the face, extremities, lips, tongue, glottis and/or larynx has been reported in patients treated with angiotensin converting enzyme inhibitors, including enalapril. In such cases VASERETIC should be promptly discontinued and appropriate therapy and monitoring should be provided until complete and sustained resolution of signs and symptoms has occurred. In instances where swelling has been confined to the face and lips the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis or larynx, likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL) and/or measures necessary to ensure a patent airway, should be promptly provided.** (See ADVERSE REACTIONS.)

Patients with a history of angioedema unrelated to ACE inhibitor therapy may be at increased risk of angioedema while receiving an ACE inhibitor (see also CONTRAINDICATIONS).

Neutropenia/Agranulocytosis: Another angiotensin converting enzyme inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Hydrochlorothiazide: Thiazides should be used with caution in severe renal disease. In patients with renal disease, thiazides may precipitate azotemia. Cumulative effects of the drug may develop in patients with impaired renal function.

Thiazides should be used with caution in patients with impaired hepatic function or progressive liver disease, since minor alterations of fluid and electrolyte balance may precipitate hepatic coma.

Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma.

The possibility of exacerbation or activation of systemic lupus erythematosus has been reported.

Lithium generally should not be given with thiazides (see PRECAUTIONS, *Drug Interactions, Enalapril Maleate and Hydrochlorothiazide).*

Pregnancy; Enalapril-Hydrochlorothiazide: There was no teratogenicity in rats given up to 90 mg/kg/day of enalapril (150 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose) or in mice given up to 30 mg/kg/day of enalapril (50 times the maximum human dose) in combination with 10 mg/kg/day of hydrochlorothiazide (2 ½ times the maximum human dose). At these doses, fetotoxicity expressed as a decrease in average fetal weight occurred in both species. No fetotoxicity occurred at lower doses; 30/10 mg/kg/day of enalapril-hydrochlorothiazide in rats and 10/10 mg/kg/day of enalapril-hydrochlorothiazide in mice.

When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, VASERETIC should be discontinued as soon as possible. (See *Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality,* below.)

Enalapril Maleate; Fetal/Neonatal Morbidity and Mortality: ACE inhibitors can cause fetal and neonatal morbidity and death when administered to pregnant women. Several dozen cases have been reported in the world literature. When pregnancy is detected, ACE inhibitors should be discontinued as soon as possible.

The use of ACE inhibitors during the second and third trimesters of pregnancy has been associated with fetal and neonatal injury, including hypotension, neonatal skull hypoplasia, anuria, reversible or irreversible renal failure, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function; oligohydramnios in this setting has been associated with fetal limb contractures, craniofacial deformation, and hypoplastic lung development. Prematurity, intrauterine growth retardation, and patent ductus arteriosus have also been reported, although it is not clear whether these occurrences were due to the ACE-inhibitor exposure.

These adverse effects do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. Mothers whose embryos and fetuses are exposed to ACE inhibitors only during the first trimester should be so informed. Nonetheless, when patients become pregnant, physicians should make every effort to discontinue the use of VASERETIC as soon as possible.

Rarely (probably less often than once in every thousand pregnancies), no alternative to ACE inhibitors will be found. In these rare cases, the mothers should be apprised of the potential hazards to their fetuses, and serial ultrasound examinations should be performed to assess the intraamniotic environment.

If oligohydramnios is observed, VASERETIC should be discontinued unless it is considered lifesaving for the mother. Contraction stress testing (CST), a non-stress test (NST), or biophysical profiling (BPP) may be appropriate, depending upon the week of pregnancy. Patients and physicians should be aware, however, that oligohydramnios may not appear until after the fetus has sustained irreversible injury.

Infants with histories of *in utero* exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Exchange transfusion or dialysis may be required as means of reversing hypotension and/or substituting for disordered renal function. Enalapril, which crosses the placenta, has been removed from neonatal circulation by peritoneal dialysis with some clinical benefit, and theoretically may be removed by exchange transfusion, although there is no experience with the latter procedure.

No teratogenic effects of enalapril were seen in studies of pregnant rats and rabbits. On a mg/kg basis, the doses used were up to 333 times (in rats), and 50 times (in rabbits) the maximum recommended human dose.

Hydrochlorothiazide; Teratogenic Effects: Reproduction studies in the rabbit, the mouse and the rat at doses up to 100 mg/kg/day (50 times the human dose) showed no evidence of external abnormalities of the fetus due to hydrochlorothiazide. Hydrochlorothiazide given in a two-litter study in rats at doses of 4 - 5. 6 mg/kg/day (approximately 1 - 2 times the usual daily human dose) did not impair fertility or produce birth abnormalities in the offspring. Thiazides cross the placental barrier and appear in cord blood.

Nonteratogenic Effects: These may include fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult.

PRECAUTIONS: *General; Enalapril Maleate; Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe congestive heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with angiotensin converting enzyme inhibitors, including enalapril, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20 percent of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when enalapril has been given concomitantly with a diuretic. This is more likely to occur in patients with pre-existing renal impairment. Dosage reduction of enalapril and/or discontinuation of the diuretic may be required.

Evaluation of the hypertensive patient should always include assessment of renal function.

Hemodialysis Patients: Anaphylactoid reactions have been reported in patients dialyzed with high-flux membranes (e.g., AN 69*) and treated concomitantly with an ACE inhibitor. In these patients consideration should be given to using a different type of dialysis membrane or a different class of antihypertensive agent.

Hyperkalemia: Elevated serum potassium (greater than 5.7 mEq/L) was observed in approximately one percent of hypertensive patients in clinical trials treated with enalapril alone. In most cases these were isolated values which resolved despite continued therapy, although hyperkalemia was a cause of discontinuation of therapy in 0.28 percent of hypertensive patients. Hyperkalemia was less frequent (approximately 0.1 percent) in patients treated with enalapril plus hydrochlorothiazide. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with enalapril. (See *Drug Interactions.)*

Cough: Cough has been reported with the use of ACE inhibitors. Characteristically, the cough is nonproductive, persistent and resolves after discontinuation of therapy. ACE inhibitor-induced cough should be considered as part of the differential diagnosis of cough.

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Hydrochlorothiazide: Periodic determination of serum electrolytes to detect possible electrolyte imbalance should be performed at appropriate intervals. All patients receiving thiazide therapy should be observed for clinical signs of fluid or electrolyte imbalance: hyponatremia, hypochloremic alkalosis, and hypokalemia. Serum and urine electrolyte determinations are particularly important when the patient is vomiting excessively or receiving parenteral fluids. Warning signs or symptoms of fluid and electrolyte imbalance, irrespective of cause, include dryness of mouth, thirst, weakness, lethargy, drowsiness, restlessness, confusion, seizures, muscle pains or cramps, muscular fatigue, hypotension, oliguria, tachycardia, and gastrointestinal disturbances such as nausea and vomiting.

Hypokalemia may develop, especially with brisk diuresis, when severe cirrhosis is present, or after prolonged therapy. Interference with adequate oral electrolyte intake will also contribute to hypokalemia. Hypokalemia may cause cardiac arrhythmia and may also sensitize or exaggerate the response of the heart to the toxic effects of digitalis (e.g., increased ventricular irritability). Because enalapril reduces the production of aldosterone, concomitant therapy with enalapril attenuates the diuretic-induced potassium loss (see *Drug Interactions, Agents Increasing Serum Potassium).*

Although any chloride deficit is generally mild and usually does not require specific treatment except under extraordinary circumstances (as in liver disease or renal disease), chloride replacement may be required in the treatment of metabolic alkalosis.

Dilutional hyponatremia may occur in edematous patients in hot weather; appropriate therapy is water restriction, rather than administration of salt except in rare instances when the hyponatremia is life-threatening. In actual salt depletion, appropriate replacement is the therapy of choice.

Hyperuricemia may occur or frank gout may be precipitated in certain patients receiving thiazide therapy.

In diabetic patients dosage adjustments of insulin or oral hypoglycemic agents may be required. Hyperglycemia may occur with thiazide diuretics. Thus latent diabetes mellitus may become manifest during thiazide therapy.

The antihypertensive effects of the drug may be enhanced in the postsympathectomy patient.

If progressive renal impairment becomes evident consider withholding or discontinuing diuretic therapy.

Thiazides have been shown to increase the urinary excretion of magnesium; this may result in hypomagnesemia.

Thiazides may decrease urinary calcium excretion. Thiazides may cause intermittent and slight elevation of serum calcium in the absence of known disorders of calcium metabolism. Marked hypercalcemia may be evidence of hidden hyperparathyroidism. Thiazides should be discontinued before carrying out tests for parathyroid function.

Increases in cholesterol and triglyceride levels may be associated with thiazide diuretic therapy.

Information for Patients; Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

Pregnancy: Female patients of childbearing age should be told about the consequences of second- and third-trimester exposure to ACE inhibitors, and they should also be told that these consequences do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. These patients should be asked to report pregnancies to their physicians as soon as possible.

NOTE: As with many other drugs, certain advice to patients being treated with VASERETIC is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions; Enalapril Maleate; Hypotension—Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted, may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS.)

Agents Causing Renin Release: The antihypertensive effect of enalapril is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: Enalapril has been used concomitantly with beta adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine and prazosin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: Enalapril attenuates diuretic-induced potassium loss. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia they should be used with caution and with frequent monitoring of serum potassium.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant enalapril and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Hydrochlorothiazide; When administered concurrently the following drugs may interact with thiazide diuretics:

Alcohol, barbiturates, or narcotics—potentiation of orthostatic hypotension may occur.

Antidiabetic drugs (oral agents and insulin)—dosage adjustment of the antidiabetic drug may be required.

Other antihypertensive drugs—additive effect or potentiation.

Cholestyramine and colestipol resins—Absorption of hydrochlorothiazide is impaired in the presence of anionic exchange resins. Single doses of either cholestyramine or colestipol resins bind the hydrochlorothiazide and reduce its absorption from the gastrointestinal tract by up to 85 and 43 percent, respectively.

Corticosteroids, ACTH—intensified electrolyte depletion, particularly hypokalemia.

Pressor amines (e.g., norepinephrine)—possible decreased response to pressor amines but not sufficient to preclude their use.

Skeletal muscle relaxants, nondepolarizing (e.g., tubocurarine)—possible increased responsiveness to the muscle relaxant.

Lithium—should not generally be given with diuretics. Diuretic agents reduce the renal clearance of lithium and add a high risk of lithium toxicity. Refer to the package insert for lithium preparations before use of such preparations with VASERETIC.

Non-steroidal Anti-inflammatory Drugs—In some patients, the administration of a non-steroidal anti-inflammatory agent can reduce the diuretic, natriuretic, and antihypertensive effects of loop, potassium-sparing and thiazide diuretics. Therefore, when VASERETIC and non-steroidal anti-inflammatory agents are used concomitantly, the patient should be observed closely to determine if the desired effect of the diuretic is obtained.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Enalapril in combination with hydrochlorothiazide was not mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril-hydrochlorothiazide did not produce DNA single strand breaks in an *in vitro* alkaline elution assay in rat hepatocytes or chromosomal aberrations in an *in vivo* mouse

Vaseretic® is a registered trademark of Merck & Co., Inc. Manufactured by Merck & Co., Inc. © 1993 DuPont Pharma Printed in USA

bone marrow assay.

Enalapril Maleate: There was no evidence of a tumorigenic effect when enalapril was administered for 106 weeks to rats at doses up to 90 mg/kg/day (150 times* the maximum daily human dose). Enalapril has also been administered for 94 weeks to male and female mice at doses up to 90 and 180 mg/kg/day, respectively, (150 and 300 times* the maximum daily dose for humans) and showed no evidence of carcinogenicity.

Neither enalapril maleate nor the active diacid was mutagenic in the Ames microbial mutagen test with or without metabolic activation. Enalapril was also negative in the following genotoxicity studies: rec-assay, reverse mutation assay with *E. coli*, sister chromatid exchange with cultured mammalian cells, and the micronucleus test with mice, as well as in an *in vivo* cytogenic study using mouse bone marrow.

There were no adverse effects on reproductive performance in male and female rats treated with 10 to 90 mg/kg/day of enalapril.

Hydrochlorothiazide: Two-year feeding studies in mice and rats conducted under the auspices of the National Toxicology Program (NTP) uncovered no evidence of a carcinogenic potential of hydrochlorothiazide in female mice (at doses of up to approximately 600 mg/kg/day) or in male and female rats (at doses of up to approximately 100 mg/kg/day). The NTP, however, found equivocal evidence for hepatocarcinogenicity in male mice.

Hydrochlorothiazide was not genotoxic *in vitro* in the Ames mutagenicity assay of *Salmonella typhimurium* strains TA 98, TA 100, TA 1535, TA 1537, and TA 1538 and in the Chinese Hamster Ovary (CHO) test for chromosomal aberrations, or *in vivo* in assays using mouse germinal cell chromosomes, Chinese hamster bone marrow chromosomes, and the *Drosophila* sex-linked recessive lethal trait gene. Positive test results were obtained only in the *in vitro* CHO Sister Chromatid Exchange (clastogenicity) and in the Mouse Lymphoma Cell (mutagenicity) assays, using concentrations of hydrochlorothiazide from 43 to 1300 µg/mL, and in the *Aspergillus nidulans* non-disjunction assay at an unspecified concentration.

Hydrochlorothiazide had no adverse effects on the fertility of mice and rats of either sex in studies wherein these species were exposed, via their diet, to doses of up to 100 and 4 mg/kg, respectively, prior to conception and throughout gestation.

Pregnancy: Pregnancy Categories C (first trimester) *and D* (second and third trimesters). See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Nursing Mothers: Enalapril and enalaprilat are detected in human milk in trace amounts. Thiazides do appear in human milk. Because of the potential for serious reactions in nursing infants from either drug, a decision should be made whether to discontinue nursing or to discontinue VASERETIC, taking into account the importance of the drug to the mother.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS: VASERETIC has been evaluated for safety in more than 1500 patients, including over 300 patients treated for one year or more. In clinical trials with VASERETIC no adverse experiences peculiar to this combination drug have been observed. Adverse experiences that have occurred, have been limited to those that have been previously reported with enalapril or hydrochlorothiazide.

The most frequent clinical adverse experiences in controlled trials were: dizziness (8.6 percent), headache (5.5 percent), fatigue (3.9 percent) and cough (3.5 percent). Adverse experiences occurring in greater than two percent of patients treated with VASERETIC in controlled clinical trials were: muscle cramps (2.7 percent), nausea (2.5 percent), asthenia (2.4 percent), orthostatic effects (2.3 percent), impotence (2.2 percent), and diarrhea (2.1 percent).

Clinical adverse experiences occurring in 0.5 to 2.0 percent of patients in controlled trials included: *Body As A Whole:* Syncope, chest pain, abdominal pain; *Cardiovascular:* Orthostatic hypotension, palpitation, tachycardia; *Digestive:* Vomiting, dyspepsia, constipation, flatulence, dry mouth; *Nervous/Psychiatric:* Insomnia, nervousness, paresthesia, somnolence, vertigo; *Skin:* Pruritus, rash; *Other:* Dyspnea, gout, back pain, arthralgia, diaphoresis, decreased libido, tinnitus, urinary tract infection.

Angioedema: Angioedema has been reported in patients receiving VASERETIC (0.6 percent). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis and/or larynx occurs, treatment with VASERETIC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In clinical trials, adverse effects relating to hypotension occurred as follows: hypotension (0.9 percent), orthostatic hypotension (1.5 percent), other orthostatic effects (2.3 percent). In addition syncope occurred in 1.3 percent of patients. (See WARNINGS.)

Cough: See PRECAUTIONS, *Cough.*

Clinical Laboratory Test Findings: Serum Electrolytes: See PRECAUTIONS.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.6 percent of patients with essential hypertension treated with VASERETIC. More marked increases have been reported in other enalapril experience. Increases are more likely to occur in patients with renal artery stenosis. (See PRECAUTIONS.)

Serum Uric Acid, Glucose, Magnesium, and Calcium: See PRECAUTIONS.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g percent and 1.0 vol percent, respectively) occur frequently in hypertensive patients treated with VASERETIC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1 percent of patients discontinued therapy due to anemia.

Liver Function Tests: Rarely, elevations of liver enzymes and/or serum bilirubin have occurred.

Other adverse reactions that have been reported with the individual components are listed below and, within each category, are in order of decreasing severity.

Enalapril Maleate—Enalapril has been evaluated for safety in more than 10,000 patients. In clinical trials adverse reactions which occurred with enalapril were also seen with VASERETIC. However, since enalapril has been marketed, the following adverse reactions have been reported: *Body As A Whole:* Anaphylactoid reactions (see PRECAUTIONS, *Hemodialysis Patients*); *Cardiovascular:* Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances including atrial tachycardia and bradycardia; atrial fibrillation; hypotension; angina pectoris; *Digestive:* Ileus, pancreatitis, hepatic failure, hepatitis (hepatocellular [proven on rechallenge] or cholestatic jaundice), melena, anorexia, glossitis, stomatitis, dry mouth; *Hematologic:* Rare cases of neutropenia, thrombocytopenia and bone marrow depression. Hemolytic anemia, including cases of hemolysis in patients with G-6-PD deficiency, has been reported; a causal relationship to enalapril has not been established. *Nervous System/Psychiatric:* Depression, confusion, ataxia, peripheral neuropathy (e.g., paresthesia, dysesthesia); *Urogenital:* Renal failure, oliguria, renal dysfunction (see PRECAUTIONS), flank pain, gynecomastia; *Respiratory:* Pulmonary infiltrates, bronchospasm, pneumonia, bronchitis, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection; *Skin:* Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pemphigus, alopecia, flushing, photosensitivity; *Special Senses:* Blurred vision, taste alteration, anosmia, conjunctivitis, dry eyes, tearing.

Miscellaneous: A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgia/arthritis, myalgia/myositis, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash and other dermatologic manifestations.

Fetal/Neonatal Morbidity and Mortality: See WARNINGS, *Pregnancy, Enalapril Maleate, Fetal/Neonatal Morbidity and Mortality.*

Hydrochlorothiazide—Body as a Whole: Weakness; *Digestive:* Pancreatitis, jaundice (intrahepatic cholestatic jaundice), sialadenitis, cramping, gastric irritation, anorexia; *Hematologic:* Aplastic anemia, agranulocytosis, leukopenia, hemolytic anemia, thrombocytopenia; *Hypersensitivity:* Purpura, photosensitivity, urticaria, necrotizing angiitis (vasculitis and cutaneous vasculitis), fever, respiratory distress including pneumonitis and pulmonary edema, anaphylactic reactions; *Musculoskeletal:* Muscle spasm; *Nervous System/Psychiatric:* Restlessness; *Renal:* Renal failure, renal dysfunction, interstitial nephritis (see WARNINGS); *Skin:* Erythema multiforme including Stevens-Johnson syndrome, exfoliative dermatitis including toxic epidermal necrolysis, alopecia; *Special Senses:* Transient blurred vision, xanthopsia.

* Based on patient weight of 50 kg.

LETTERS TO THE EDITOR

Like father, like son

The biography of Samuel Claggett Chew as reported by Woodward[1] highlights the contributions of an outstanding physician to Maryland medicine. He must have been imbued with a great love for medicine, as he was truly a son of his father, Samuel Chew.

Chew, *père,* was born in Calvert County but received his preliminary education in Saint Mary's County. He was awarded a bachelor of arts degree in 1825 and a master of arts in 1828, both from Princeton. He graduated in medicine from the University of Maryland in 1829.

Intimately connected with the Medical and Chirurgical Faculty, he served as the librarian from 1835 to 1841; treasurer from 1838 to 1839, orator in 1858, and vice president from 1859 to 1863. In addition, he was professor of materia medica from 1841 to 1852; dean, 1842 to 1844; and professor of practice, 1852 to 1863, all at the University of Maryland. Interestingly, his son was also dean at Maryland from 1874 to 1879.

Sons not infrequently follow in the footsteps of their fathers. The most famous father–son combination may have been John Adams and John Quincy Adams, who were presidents of the United States. Another political duo was the Tafts of Ohio with a president and a senator. Alexandre Dumas and his son of the same name were famous in the nineteenth-century French literary world. Medically, several names come to mind: Charles Horace Mayo and his son, Charles Worral; John M.T. Finney and his sons, John and George; and Isaac Ridgeway Trimble and his son, I. Ridgeway.

The founder group of the Medical and Chirurgical Faculty included 85 men of whom 17 (20%) had sons who became physicians. During the first century of its existence, the Faculty had 2,073 members, and 98 (4.7%) had sons as doctors.

The most well-known of the founder group was John Archer—the first medical graduate in America. Dr. Archer had 10 children, 4 of whom died in infancy. Of the six survivors, all sons, five elected medicine for a career and studied under their father. Unfortunately, one son died while a student. The other five sons completed their studies at the University of Pennsylvania. One of these doctors, Thomas, was also a founding member of the faculty.

LETTERS TO THE EDITOR

A first for Med Chi 138 years ago

The enclosed bit of trivia came to light—at least for me—several weeks ago as I was researching the history of medicine in Baltimore, particularly public health practices.

The news was that the Medical and Chirurgical Faculty had been the first in America (June 8, 1855) to propose the substitution of the decimal weights and measures for those then in use.

"David Stewart, M.D., was a Baltimore City Council member, 1835–1837; school commissioner, 1836; drug inspector for the Port of Baltimore; member of the state Senate, 1840; founder and lecturer, Maryland Medical Institute, 1847; State Agricultural Society chemist; professor of chemistry and natural philosophy and vice president, St. Johns College, Annapolis, 1855–1862; and founder of the Maryland College of Pharmacy.... It was on his motion that the Medical and Chirurgical Faculty...was the first in America to propose the substitution of the decimal weights and measures for those in use." (Cordell EF. *The Medical Annals of Maryland*. Baltimore: Williams & Wilkins. 1903.)

An interesting first, considering how long we have taken to get even a few measurements in metric.

JOHN B. DeHOFF, M.D.
Cockeysville, Maryland ■

Memories of Edelin

The description of Toulouse-Lautrec (Miller JM, *Md Med J* 1993; 42: 675-76) recalled an elegist's description of William J. Edelin, M.D., a St. Mary's County physician who died about 1874.

Elegist "E. J. C." wrote, in part, that Edelin "...stood high in his profession if low in his boots...." (*The Medical Annals of Maryland.* Baltimore, Maryland: Williams & Wilkins. 1903. p. 389.)

"People who care for people who need care"

Gastroenteritis outbreak in a Maryland nursing home

Seth L. Emont, Ph.D., M.S.; Timothy R. Coté, M.D., M.P.H.; Diane M. Dwyer, M.D.; and John M. Horan, M.D., M.P.H.

ABSTRACT: *From December 25, 1990, to January 12, 1991, an outbreak of acute viral gastroenteritis occurred among 132 residents and 102 employees of a Maryland nursing home. Illness typically lasted 24 hours and was characterized by diarrhea, vomiting, and fever. The attack rate was 46.2% (61/132) for residents and 42.2% (43/102) for employees. No differences in attack rates were observed by station in the facility. The risk of having an early case (before the peak of the outbreak on January 2, 1991) was 3.5 times greater for employees with patient contact than for employees without patient contact. Analyses of temporal and geographic clustering of cases suggest that person-to-person transmission was an important transmission mode. Although an etiologic agent was not identified, the short duration of illness, high rates of vomiting and diarrhea, and high attack rate are consistent with Norwalk-like viral infection.*

Dr. Emont is director, Division of Chronic Diseases, Indiana State Department of Health, Indianapolis, Indiana. Dr. Coté is senior research investigator, Viral Epidemiology Branch, Division of Cancer Etiology, National Cancer Institute, Rockville, Maryland. Dr. Dwyer is chief, Center for Clinical Epidemiology, Maryland Department of Health and Mental Hygiene, Baltimore, Maryland. Dr. Horan is state branch chief, Division of Field Services, Epidemiology Program Office, Centers for Disease Control and Prevention, Atlanta, Georgia.

The rate of gastrointestinal illness ranges from 1.5 to 1.9 illnesses per person per year in the United States.[1] Diarrheal illness is an important cause of death among young children and the elderly, particularly elderly persons living in institutions. Among 28,538 persons who died from diarrhea between 1979 and 1987, 51% were over 74 years of age, and 30% were living in nonhospital, patient-care settings.[2] Although gastroenteritis outbreaks occur year-round, most occur during the winter,[1] particularly among the elderly and young children.[2] Additionally, acute nonbacterial gastroenteritis outbreaks, such as those associated with Norwalk virus infection, have occurred year-round in various places, including schools, camps, cruise ships, restaurants, and communities.[3]

In Maryland, gastroenteritis outbreaks in nursing homes are reported each winter. Between October 1990 and May 1991, 27 reported outbreaks of gastroenteritis in nursing homes accounted for 830 cases among residents

Table 1. Resident case characteristics in a nursing home gastroenteritis outbreak, December 1990 to January 1991.

and employees, and more than one-third of these cases occurred during December and January. *Salmonella* and *Shigella* were ruled out as the etiologic agent in 21 of the 27 outbreaks (Maryland Department of Health and Mental Hygiene [DHMH], unpublished data, 1992).

On January 2, 1991, DHMH was notified about an outbreak of suspected viral gastroenteritis among staff and residents of a nursing home. The nursing home reported that approximately 69 residents and 21 employees were ill with symptoms of diarrhea and vomiting. The nursing home contacted the county health department and DHMH for control measure recommendations. A control plan was implemented by the nursing home, which included enteric precautions for ill residents, training in proper hand-washing technique, organizing staff and residents into cohorts, and prohibiting visitors from entering the building during the outbreak. When new cases continued to occur, DHMH initiated an investigation of the outbreak.

Background

The nursing home is a private, nonprofit, long-term care facility in a single building consisting of two stations, each divided into two wings. Station 1 consists of a north and south wing, and station 2 consists of an east and west wing. At the time of the outbreak, 132 residents shared 69 rooms; 57 rooms were double occupancy, 3 were triple occupancy, and 9 were single occupancy. None of the residents were tube fed. The health status of residents on the four wings was similar.

The nursing home employed 111 persons. About half of the employees were nurses (36%) or nurse assistants (15%); the remaining personnel (49%) were employed in dietary services, resident activities, administrative services, housekeeping, and maintenance. Administrative offices were located near the nursing home's front entrance. Nurses' offices were located in the center of each station. It was not unusual for nurses and other staff to rotate from one station to the other.

All resident activities were held in an activity room located between the two stations. Residents were given three meals each day in the dining area, also located between the stations. Thus, all residents shared dining and activity rooms.

Methods

Epidemiologic investigation. A case of gastroenteritis was defined as one or more episodes of diarrhea (two or more watery bowel movements in a 24-hour period), or at least one episode of vomiting from December 20, 1990, to January 13, 1991, in a nursing home employee or resident. Information on symptoms, type of diet, age, and sex of residents was abstracted from medical records and nurses' daily logs. To identify employees with gastroenteritis and to describe the employee population, questionnaires were distributed to all employees. Employees were also asked if they purchased their meals at the nursing home.

The risk of having gastroenteritis before the outbreak peaked on January 2, 1991 (an "early case"), was assessed among employee cases. To determine whether extent of patient care was associated with having an early case, employee cases were categorized as having either extensive, moderate, or no patient contact. Nurses and nurse assistants were categorized as having extensive patient contact; medical aides, administrative nurses, social workers, and activities coordinators as having moderate patient contact; and housekeepers, dietary workers, secretaries, administrators, resident services coordinators, and maintenance workers as having no patient contact.

Chi-square tests were used to assess the relationship for residents between age, sex, type of diet, and disease outcome. For the double-occupancy rooms, geographic clustering of cases was assessed using the Kolmogorov-Smirnov (K-S) test

as follows: the expected numbers of rooms with no persons ill, one person ill, or two persons ill were calculated by using the binomial distribution and compared with the observed numbers of rooms with no, one, or two persons ill. [4]

Incidence-density analysis [4] was used to determine whether temporal clustering of cases occurred among residents of double-occupancy rooms in which at least one case of illness occurred. Illness was examined as a function of exposure to a roommate who had become ill one or two days earlier. The total number of susceptible person-days for these residents was calculated from the day after the first case began (December 26, 1990) through the day the last case began (January 12, 1991). The total number of susceptible person-days was then divided into high-risk days (one or two days after the onset of illness in a roommate) and background-risk days (all other days during the outbreak).

ref = reference group.

Laboratory investigation. Stool specimens from 17 acutely ill patients were tested for *Salmonella*, *Shigella*, and *Yersinia* at DHMH Annapolis Branch Laboratories. Stool samples from two acutely ill residents and one employee were collected within the first 48 hours of illness and sent to the Division of Viral and Rickettsial Diseases, National Center for Infectious Diseases, Centers for Disease Control and Prevention (CDC), for examination of virus particles by immune electron microscopy. As specified by CDC guidelines,[5] 10 pairs of acute- and convalescent-phase serum samples were collected from ill residents and staff and tested by the same laboratory for antibodies against Norwalk agent and for reaction to particles found in the stool samples. Paired serum specimens were also obtained from 10 well persons.

Results

Information was collected for all residents and 102 (92%) of 111 employees. Demographic information for residents and employees with a case of gastroenteritis is presented in **Tables 1 and 2,** respectively. The overall attack rate was 44% (104 cases). The first case was recognized on December 25, 1990, when a resident of station 1 became ill. The outbreak peaked on January 2, 1991, at 26 cases and ended January 12, 1991, for a total outbreak period of 19 days (**Figures 1 and 2**).

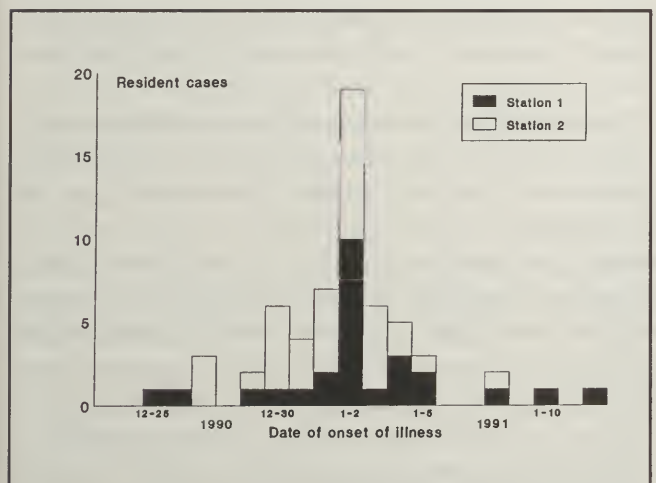

Figure 1. Number of resident cases of gastroenteritis (diarrhea or vomiting), by date of onset, in a Maryland nursing home, December 1990 to January 1991.

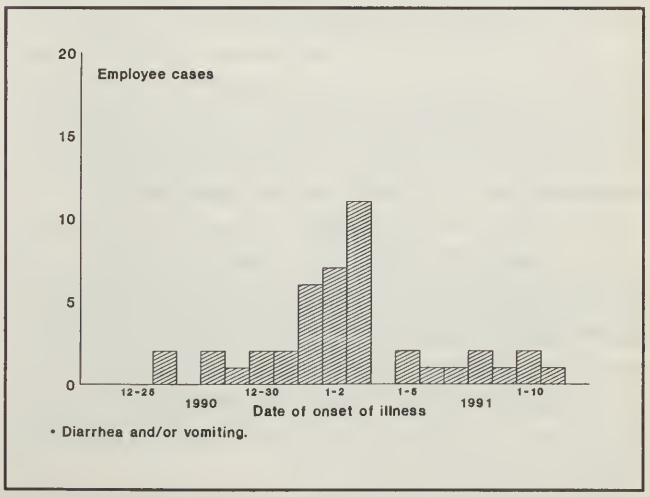

Figure 2. Number of employee cases of gastroenteritis (diarrhea or vomiting), by date of onset, in a Maryland nursing home, December 1990 to January 1991.

Table 3. Symptoms and duration of illness among resident and employee cases in a Maryland nursing home gastroenteritis outbreak, December 1990 to January 1991

Characteristics	Resident cases* (n=61)		Employee cases* (n=43)		Total* (n=104)	
	No.	%	No.	%	No.	%

≥ 2 days	0	0.0	6	42.9	6	40.0

*Percentage of case patients reporting symptom.
** Self-reported.

Residents. Ninety-eight (74%) residents were women and 34 (26%) were men. The mean age among residents was 79.9 years (range: 35 to 101). Only four (3%) residents were bedridden; 57 (43%) were ambulatory, and 71 (54%) used wheelchairs.

Illness was mild and typically lasted for 24 hours. No deaths and three hospitalizations occurred, but these hospitalizations may not have been related to the outbreak. The symptom most often reported was diarrhea (**Table 3**)—for 45 (74%) of 61 resident cases. For 34 case patients for whom duration of diarrhea was known, 31 (91%) reported one-day duration and three (9%) reported two- to nine-day duration. Vomiting was reported by 41 (67%) of 61 resident cases. For the 40 case patients for whom duration of vomiting was known, 39 (98%) reported one-day duration, and only one (3%) reported that vomiting lasted for two days. Fever was documented for only one resident case, and duration of fever was one day.

For residents, the overall attack rate was 46%. At the peak of the outbreak, 19 cases were reported in residents. No difference in attack rates was observed between the two stations (**Figure 1** and **Table 1**) or by degree of ambulation. The attack rate for bedridden residents (25%) was lower than that for wheelchair-bound (49%) or ambulatory residents (44%), but the differences among the three groups were not statistically significant ($\chi^2(2) = 1.12$; $p = .57$).

Forty-nine percent of women and 38% of men became ill ($\chi^2(2) = 0.78$; $p = .38$). Older residents were at significantly increased risk for illness (**Table 1.** $\chi^2(2) = 9.75$; $p < .01$).

Attack rates did not differ significantly by type of diet (i.e., regular, low salt, no concentrated sweets, calorie controlled, 1,200 calorie, or 1,500 calorie) or by the use of nutritional supplements (e.g., egg-nog or protein supplement).

Analysis of geographic clustering of resident-cases indicated that among the 57 double-occupancy rooms, the number of rooms with no persons ill, one person ill, or two persons ill was different from what would have been expected if the distribution of illness had been binomial (K-S test, $z = 3.0$, $p < .001$). Twenty-three rooms had no ill residents, 18 rooms had one ill resident, and 16 rooms had two ill residents.

Analysis of temporal clustering of cases indicated that, in the 34 rooms with at least two occupants and one case patient, the risk for a roommate becoming ill one or two days after the first case occurred in the room compared with becoming ill at any other time during the outbreak was 2.04 (95% confidence interval [CI], 0.88 to 4.21; incidence-density ratio = (9/67)/(47/713), two-tail test $p < .1$).

Employees. Ninety-eight (96%) employees were women and four (4%) were men. The mean age among employees was 40.6 years (range: 16 to 67 years). About 63% of employees were categorized as having patient contact. This group primarily consisted of health professionals and social activities staff (**Table 2**). The risk of having an early case was 3.5 times greater (95% CI, 0.9 to 13.4) for employees with patient contact than for employees with no patient contact (Fisher's exact test, two-tailed, $p < .05$).

Forty-three employees became ill for an overall attack rate of 42%. The first two employees to become ill (a nurse assistant from station 1 and a receptionist) had onset of illness on December 26. Most employee cases (n = 11) occurred on January 3. Resident-cases peaked on January 2, and a greater proportion of employee cases (49%) had onset after this date than did resident cases (30%). As with residents, no differences in attack rates were noted by sex. In addition, rates did not differ between employees who purchased meals at the nursing home and those who did not (50% vs 40%; $\chi^2 = 0.61$, $p = .44$).

Employee illness typically lasted for 24 hours. As with residents, the symptom most often reported was diarrhea—for 35 (81%) employee cases. Duration of diarrhea was one day for 23 employees (66%) and two to four days for 12 employees

(34%). Vomiting was reported by 31 (72%) employee cases. Duration of vomiting was one day for 20 (65%) employees and two to five days for 11 (36%) employees. Fever was reported by 14 (33%) employee cases; eight (57%) of those persons reported a one-day duration of fever, and six reported two- to eight-day duration.

Laboratory investigation. All 17 stool specimens were negative for *Salmonella*, *Shigella*, and *Yersinia*. A Norwalk-like agent was isolated from one of the three stool specimens tested at CDC. This particle, however, was not related to the present outbreak since it did not react with the convalescent-phase serum specimens. In addition, the assays of serologic response did not show a rise in antibody titer to the Norwalk agent.

Discussion

Although a specific etiologic agent was not isolated in this outbreak, the illness was consistent with that caused by a Norwalk-like virus. The high rates of vomiting and diarrhea, the short (one- to two-day) duration of illness, and the high attack rates are consistent with features of 81 outbreaks of acute nonbacterial gastroenteritis, 47% of which documented Norwalk virus infection.[3]

The original source of the outbreak could not be identified from the available information. The illness may have been introduced to the nursing home by visitors during Christmas week when many social activities, such as children's choirs, involved outside guests. Some residents left the nursing home for Christmas and may have been exposed to someone who was ill with the virus. The temporal and geographic clustering of resident cases and the attack rates for staff with patient contact suggest person-to-person transmission of illness once the virus was introduced to the nursing home.

The 44% attack rate at the nursing home was high. Although infection-control personnel at the nursing home reported having implemented control measures, when such measures began and how rigorously they were enforced are not clear. When the outbreak was reported, the local health department recommended that the nursing home follow DHMH guidelines for control of gastroenteritis outbreaks in long-term care facilities. These guidelines include assigning employees to cohorts of residents, stopping new nursing home admissions, limiting guest visitation, restricting ill residents from group activities until two days after illness resolution, training employees about proper cleaning of contaminated areas and laundry and proper hand-washing practices, and excluding symptomatic employees from patient care and food handling until two days after resolution of illness.

Sawyer and coworkers[6] suggested airborne virus transmission in a hospital outbreak of acute gastroenteritis. They hypothesized that the virus became airborne by contaminated laundry or explosive vomiting and diarrhea. Airborne virus transmission may have been involved in this outbreak, particularly since the nursing home has a closed environment.[7] Additionally, either airborne transmission or fomites could account for cases among employees who had no resident contact (e.g., secretaries).

Having over 40% of residents and staff ill over a two-week period creates enormous problems for a nursing home, including staff absenteeism at a time of increased staffing need. Prompt implementation of infection-control measures, such as hand washing after contact with every patient with diarrhea or vomiting until a noninfectious cause of illness is found, may limit the spread of infectious diarrheal agents. Patient care providers should wear disposable gloves when feces or fecally soiled articles or equipment are handled and should change their gloves once they have been contaminated.[7-8] Because of environmental factors that may increase disease transmission risk, such as a closed setting, close proximity of residents in living quarters, and elderly persons' increased susceptibility to illness, enforcement of infection-control measures should be routine in nursing homes.

YESTERDAY, TODAY AND TOMORROW

Yesterday Renowned for our consistently high standards, we believe that excellence is never "old fashioned". We developed a laboratory based on high quality, state-of-the-art testing methodologies, personal service, and dedicated patient care.

Today As an industry leader using the most advanced scientific technology, we continue to process your laboratory needs efficiently, quickly and cost effectively. Our skilled staff of pathologists, medical technologists, and hundreds of administrative and support personnel remain dedicated to personal service and personal care.

Tomorrow New technology may bring us an even brighter future, but it will never surpass the human element in our service. Our tradition of caring, and old fashioned pride will never change. Our commitment to excellence will continue to shine brightly in the years ahead.

Oral cancer mortality in Maryland

Ronald D. Carpenter, D.D.S., M.P.H.; Janet A. Yellowitz, D.M.D., M.P.H.; and Harold S. Goodman, D.M.D., M.P.H.

Dr. Carpenter is a dental public health resident, Veterans Affairs Medical Center, Perry Point, Maryland, and a staff dentist, VA Medical Center, Nashville, Tennessee. Dr. Yellowitz is director, geriatric dentistry, University of Maryland at Baltimore dental school, Baltimore, Maryland. Dr. Goodman is director, Dental Public Health Residency Program, Veterans Affairs Medical Center, Perry Point, Maryland.

ABSTRACT: *Oral cancer mortality is one of the most preventable types of cancer deaths when the lesion is detected early. The survival rate is quite low, however, when oral cancer is diagnosed at an advanced stage. While the Maryland oral cancer incidence rate is lower than the US average, the state ranks fourth in the country for overall age-adjusted oral cancer mortality; Maryland's African-American population has the highest oral cavity and pharyngeal mortality rate. Delayed diagnosis may explain this occurrence since groups at high risk for developing oral cancer, such as the elderly and minority groups, do not have ready access to the Maryland oral health care system. As the elderly annually use physicians' services almost twice as much as they use dentists' services, physicians are encouraged to routinely complete an oral cavity and pharyngeal examination. Inclusion of oral health services into a Maryland health system reform benefits package would also improve routine screening frequency for oral cancer.*

Each year in the United States, more than 30,000 people are diagnosed with oral cancer, accounting for 4% of all cancers.[1-3] Like most cancers, oral cancer occurs in the older age segment of the population, with the majority of those diagnosed being 65 years of age and older.[2] While the incidence, or rate of new oral cancer cases has remained relatively constant in the general population, the incidence in African-American males appears to be increasing.[2] Although attracting little attention, oral cancer is more common than leukemia; melanoma; Hodgkin's disease; and cancer of the brain, liver, bone, thyroid gland, stomach, ovaries, or cervix.[1-2] Persons with oral cancer are also at an increased risk (8%–36%) for developing subsequent malignancies.[4-6] Squamous cell carcinoma is the most common type of oral and pharyngeal cancer, accounting for 90% of all oral malignancies.[3]

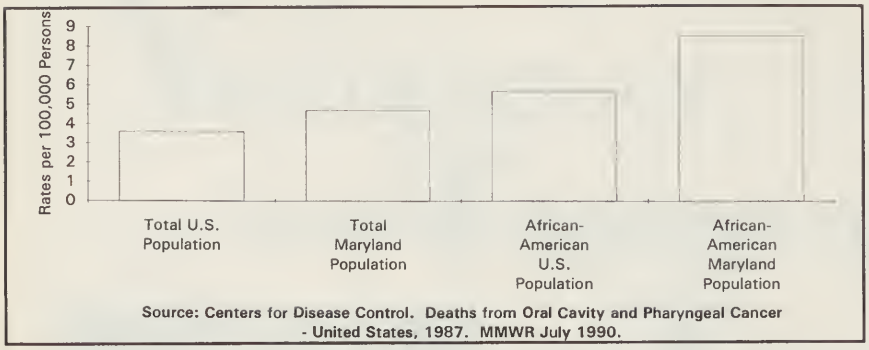

Figure 1. Oral cavity and pharyngeal cancer age-adjusted mortality (1987).

Tongue cancers are the single largest contributor to oral cavity cancer, accounting for almost 30% of these cancers.[2]

Each year in the United States, over 8,000 deaths are attributed to oral cancer.[2] The number of deaths resulting from oral cancer is likely to be masked by other, more conspicuous, comorbid conditions.[7] When detected early, the prognosis for oral malignancy is far better than for most cancers.[8] Oral cancers are often more readily accessible and capable of being diagnosed earlier than other cancers. Of the 13 major cancer sites, however, oral cancer has the fifth lowest five-year survival rate.[2] This relatively poor survival rate is associated with the fact that most oral cancer lesions are not diagnosed until they are relatively advanced.[9] Advanced lesions outnumbered localized lesions by more than two to one in the 12,425 cases recorded in the National Cancer Institute Surveillance, Epidemiology, and End Results (SEER) program.[4]

Not surprisingly, the oral cancer mortality rate is higher in groups with poor access to the oral health care system.[2,10] The oral cancer mortality rate for African-Americans, for example, is nearly twice as high as for their white peers.[2] Although a variety of factors are operative for all cancers and may account for the later stage at which oral cancers are diagnosed (e.g., lack of access to care and patient delay), the data suggest that the lack of early detection is a potential contributing factor.[11]

Concomitant with deaths from other cancers, Maryland has one of the highest rates of oral cancer mortality in the country.[12] This paper describes the disproportionately high oral cancer mortality rate in Maryland and discusses how the health care system can reduce these rates.

Table 1. Maryland counties' oral cavity, pharynx, and esophageal cancer death rate per 100,000, 1985-1987

Oral cancer incidence and mortality rates

In 1990, Maryland ranked 27th in the United States in terms of its age-adjusted oral cancer incidence rate, ranking lower than the US average (11.6 vs 12.2 per 100,000 persons).[12] Unlike its incidence rate, however, Maryland's age-adjusted mortality rate far exceeded the national average in 1987 (4.7 vs 3.2 per 100,000 persons) and was fourth highest in the United States.[12] Maryland's high mortality rate may be attributed to its African-American population, which has the highest oral cavity and pharyngeal cancer mortality rate in the country, a rate that is 74% higher than the overall US African-American population rate (**Figure 1**).[12]

Table 1 lists the oral cancer mortality rate by Maryland county for 1985–1987.[13] This table includes cancer of the oral cavity, pharynx, and esophagus. All other references to oral cancer include cancer of the oral cavity and pharynx only. The state regions with the highest mortality rates are western Maryland, the Eastern Shore, and Baltimore City.

Although oral cancer occurs more frequently in males than females, the ratio of US men to women with oral cancer has dramatically decreased from 6:1 in 1950 to 2:1 in 1990.[6] One explanation for this reduction relates to the increase in smoking among women.[14]

Risk factors

The major oral cancer risk factors are the use of tobacco products (including smokeless tobacco) and alcohol consumption.[3] Although an estimated 30% of all cancer deaths are related to smoking, almost 75% of

oral cavity and pharyngeal cancers are attributed to tobacco use.[2] The combination of smoking and alcohol use demonstrate relative risks that are multiplicative and substantially greater than those for smoking or alcohol use alone. The association of tobacco and alcohol use with cancers of the oral cavity and pharynx appears to be dose-related.[15]

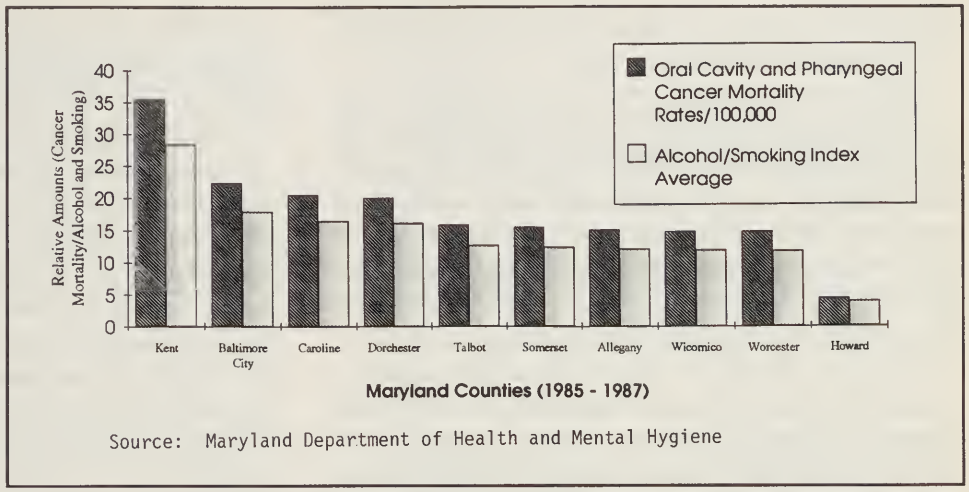

Figure 2. Oral cavity and pharyngeal cancer mortality compared with alcohol and smoking usage.

Figure 2 shows a corresponding relationship between smoking and alcohol usage for the Maryland counties with the highest rates of oral cancer mortality, as well as Howard County, which ranked last in oral cancer mortality.[13] The graph shows that the counties with the higher alcohol/smoking index averages have higher oral cancer mortality rates.

Other factors contributing to oral cancer risk include viral infections, immunodeficiencies, and occupational exposures,[16] with ultraviolet rays being a major cause of lip cancer.[17] These phenomena, however, do not completely account for Maryland's disproportionately high mortality rate and average incidence rate when compared with the US average. Considering the high survival rates associated with early oral cancer detection, a more plausible explanation may be delayed diagnosis.

Early detection and routine examination

Early detection of oral cancer has been shown to result in a marked reduction in mortality rates associated with the disease if the patient stops tobacco use. Studies have demonstrated that the percentage of people surviving five years after diagnosis corresponds to the cancer stage at the time of diagnosis. From 1974 to 1986, 38% of oral cavity and pharyngeal cancers were localized.[2] For oral cavity and pharyngeal cancer, the five-year survival rate was 75% for those with localized disease at diagnosis, compared with only 16% for those with metastases (**Figure 3**).[2] When compared with the white population, African-Americans had a statistically significant lower five-year survival rate (31.2% vs 53.4%) from oral cancer.[2]

Those individuals fortunate to survive metastatic oral cancer often experience a lengthy recovery time, pain, suffering, physical disfigurement, and concomitant psychological problems. Cancer treatment and its sequelae promote disorders, such as speech and hearing impairments, that can diminish the ability to resume occupational and social functions. Furthermore, oral cancer and its treatment can limit dietary and nutritional choices if there is a loss of salivary function and structures necessary for adequate mastication and swallowing.

The proportion of cancers detected at an earlier, more localized stage would perhaps increase if routine oral cancer screening was performed by **both** physicians and dentists. Oral cancer screening is a simple noninvasive procedure that can be accomplished routinely in less than two minutes.[18] The clinician should inspect extraoral and intraoral tissues for texture or color changes, bleeding, lesions, ulcerations, masses, and lymphadenopathy. Symptoms may include a sore or irritation in the mouth, dysphagia, bleeding, swelling of oral tissues, and numbness of the tongue or other areas of the mouth. The patient may also be asymptomatic. The most common oral carcinoma site is the tongue (29.2%), followed by the gingiva

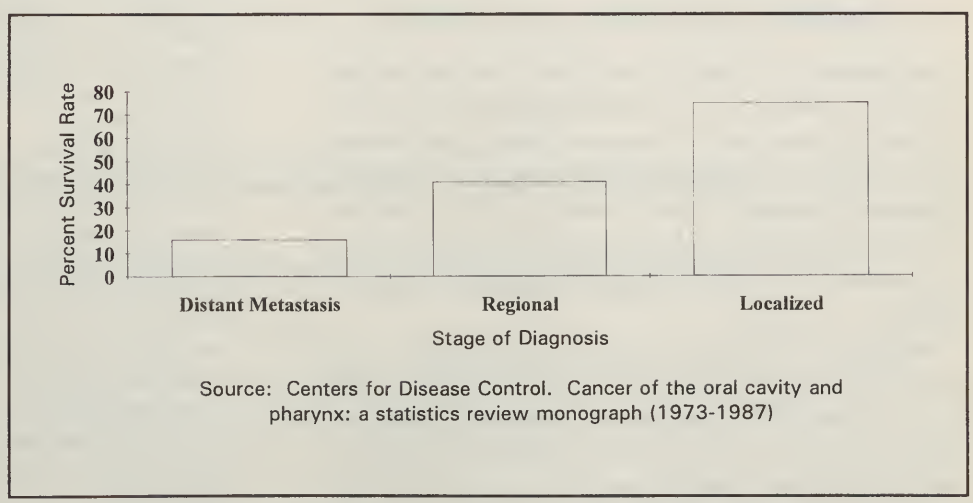

Figure 3. Oral and pharyngeal cancer five-year survival rates by stage of diagnosis (1973-1987).

and other mouth sites (25.2%), lip (17.4%), floor of the mouth (16.4%), and salivary glands (11.8%).[2]

Dentists **and** physicians have a unique opportunity to detect malignant neoplasia while it is asymptomatic, innocuous, and unsuspected. Physicians play a vital role in this process because older adults—the primary risk group for oral cancer—visit physicians almost twice as much as they do dentists. Over 80% of individuals 65 years and older visit a physician annually,[19] while only 42% visit a dentist.[20] The discrepancy in utilization rates is even more striking for low-income elderly groups.[19-20]

Both public and professional awareness of oral cancer are essential for reducing the time between onset of signs and symptoms and diagnosis. In a recent national health survey of more than 41,000 people, college-educated individuals did not consider regular alcohol consumption to be a risk factor for mouth cancer.[21] Most patients delay seeking professional advice for more than three months after becoming aware of an oral sign or symptom.[1] Patient delay in seeking consultation leads to potential extension and spread of the lesion.

A recent Maryland study found that most physicians do not conduct a routine oral cancer examination of their elderly patients and their knowledge of oral cancer is not current.[22] This may be attributable to the fact that many nondental health professionals have received minimal or no training in oral health, and oral cancer detection, education, and referral.

The US Public Health Service Healthy People 2000 initiative, the US Preventive Health Task Force, and the Maryland Governor's Plan for the Prevention of Heart Disease, Cancer, and Stroke recommend reducing oral cancer mortality through early diagnosis.[23-25] This can be accomplished through routine oral cancer examination of all persons by physicians and dentists, with particular attention to those individuals 65 years of age and older. Before an activity of this type and magnitude can realistically occur, however, targeted educational interventions for the various health professions need to be designed to modify behaviors and assure proficiency.

Availability and accessibility of dental services

Improvement in access to oral health care services for Maryland's socioeconomically disadvantaged elderly is needed to assure that patients receive routine oral cancer examinations, prompt diagnosis, prevention information, and, if needed, appropriate treatment or referral. Many older adults underuse oral health care services, in part, because of reduced income and a corresponding lack of public and private third-party financial support.[20]

Only 15% of the elderly—5.7% of the poor elderly—have dental insurance.[8] Medicare does not cover oral health care, and, in Maryland, Medicaid does not reimburse for adult oral health care services, including emergency care. As a result, the out-of-pocket share of dental expenditures for the elderly has been reported to be as high as 94%.[26]

The National Center for Health Statistics estimated that it annually costs $289 million to treat oral cavity and pharyngeal cancers.[27] Given that the current public support systems do not reimburse for the **preventive** oral health care services needed to screen for early signs of oral cancer, this system is then burdened to incur the expensive medical **treatment** costs. Under the new health system reform bill passed in Maryland, it would, therefore, be fiscally and philosophically prudent to include oral health benefits as part of the standard health insurance benefits package currently being developed by the Maryland Health Care Access and Cost Commission (HCACC). At a minimum, a thorough annual examination of the hard and soft tissues of the oral cavity and related structures needs to be included.

Conclusion

It has been projected that approximately 13% of the American population will be 65 years of age or older by the year 2000; this percentage could reach 21.8% by 2030.[28] This trend in population growth may portend a future increase in the number of new oral cancer cases, especially if high risk behaviors continue to be manifest in this population. With older adults visiting physicians much more frequently than dentists, primary care practitioners need to receive appropriate education and training to perform proficient oral cavity examinations as a part of their overall routine physical assessment.

Med Chi Bicentennial Celebrations

Med Chi has already begun planning celebration activities for its bicentennial in 1999. If you have ideas or suggestions, please call Margaret Burri or Vivian Smith at 410-539-0872 or 1-800-492-1056.

MARYLAND RESIDENTS:
TWO WAYS TO EARN TRIPLE-TAX-FREE INCOME

100% NO LOAD

T. ROWE PRICE MARYLAND TAX-FREE FUNDS—TWO TAX-SAVING STRATEGIES

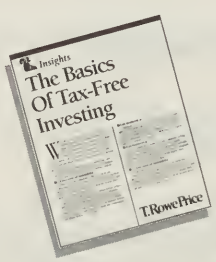
As a Maryland resident, you could be losing over 41% of your earnings to income taxes. T. Rowe Price, the leader in Maryland tax-free investing, can help. We offer *two* Maryland funds whose earnings are *exempt from federal, state, and local taxes*—the income is *triple-tax-free*, so you keep everything you earn.* And, because tax-free yields are currently attractive versus comparable taxable yields, your income can be higher with tax-free funds, as the chart shows.

Your earnings can be higher with tax-frees

Annual income on an investment of $20,000 if you're in the 36% federal tax bracket, or 41.8% bracket including state and local taxes

	What you earn		What you pay in federal, state, and local taxes		What you keep
Typical long-term bond fund					
Taxable fund	$1,074	–	$449	=	**$625**
Tax-free fund	$960	–	$0	=	**$960**
Typical short-term bond fund					
Taxable fund	$882	–	$369	=	**$513**
Tax-free fund	$676	–	$0	=	**$676**

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.*



Two no-load Funds let you choose your approach.

Whether you want to minimize risk or maximize potential returns, T. Rowe Price has a Fund to suit your needs.

Maryland Short-Term Tax-Free Bond Fund is the *only* Maryland fund to give you the minimal risk of short-term tax-free bonds. With an average portfolio maturity of 1–3 years, it can be appropriate for those who prefer a more cautious investment approach. The Fund offers less risk and lower returns than a longer-term fund.

Maryland Tax-Free Bond Fund—*Maryland's largest tax-free fund*—offers greater income potential, with greater price volatility than our short-term fund. It invests in long-term Maryland securities and has an average portfolio maturity greater than 10 years. Of course, these are both bond funds, so yields and share prices will vary as interest rates change.

Our free report can help you make an informed decision. *The Basics Of Tax-Free Investing* can help you develop a tax-free strategy to meet your investment goals. Each Fund has a $2,500 minimum, offers free checkwriting, and has **no sales charges.**

Rowe Price Investment Services, Inc., Distributor.

The Chase Manhattan Program for Physicians. Tailored mortgages from $250,000 up to $2 million or more.

CHASE understands the complex financing needs of physicians. But don't take our word for it. *Most of our referred business comes from existing clients who recommend us to their colleagues.*

One of our expert Chase Relationship Managers can offer you a broad range of financing solutions that can be tailored to your changing personal and professional needs. And since you work closely with that one individual, you will receive the personal attention you deserve.

So discover why professionals like you recommend the professionals at Chase.

Call Chase for:

- *Expert, Personal Service*
- *Easy Application Process and Prompt Loan Decisions*
- *Loan Amounts up to $2 Million or More*
- *Competitive Interest Rates*
- *Access to Other Specialists in the Chase Network of Companies*

Doctor/Lawyer/Teacher Partnership Against Drugs

Felty's syndrome: a case presentation

Piotr L. Grojec, M.D.; James H. Soliman, M.D.; and Calvin F. Fuhrmann, M.D.

From the Harbor Hospital Center where, at the time of the study, Dr. Grojec was a resident, Dr. Soliman was a junior resident, and Dr. Fuhrmann is chief, pulmonary division.

ABSTRACT: *A 64-year-old male patient with Felty's syndrome was treated with antibiotics, Plaquenil (hydroxychloroquine sulfate), and gold salts. In the fourth week of hospitalization, the patient died. Autopsy showed extensive bronchopneumonia, fibrous pleuritis, congestive splenomegaly, mild atherosclerosis, reactive lymphoid hyperplasia, congested passive liver, severe rheumatoid arthritis, and hypercellular bone marrow.*

The association of rheumatoid arthritis with splenomegaly and leukopenia, described in 1924 by Felty,[1] has become known as Felty's syndrome—a term first used in 1932 by Hanrahan and Miller.[2] The prevalence of Felty's syndrome is unknown, but it probably occurs in less than 1% of patients with rheumatoid arthritis.[3–4] Leukopenia is the result of a reduction in the neutrophils, which appears to be multifactorial in origin.[5] Other features seen in this syndrome include malaise, weight loss, frequent infections of all sorts (e.g., pneumonia, furunculosis, pyelonephritis), anemia, thrombocytopenia, skin hyperpigmentation, lymphadenopathy, pleuritis, neuropathy, episcleritis, Sjôgren's syndrome, and leg ulcers.[5–6]

Case presentation

FW was a 64-year-old male who complained of productive cough and generalized malaise for about six months prior to admission. Past medical history was significant for rheumatoid arthritis diagnosed six years previously, recurrent pneumonias, hypertension, cholecystectomy, and questionable kidney and liver disease. The patient was in his baseline state of health until six months prior to admission, when he began having productive cough associated with intermittent fever and chills but no hemoptysis. He also complained of increasing shortness of breath, generalized malaise, and, during the two months before hospitalization, of abdominal pain, tarry stools, loss of appetite, and weight loss.

Figure 1. Chest x-ray shows extensive consolidation within the left upper and lower lobes compatible with pneumonia.

The patient was married and lived with his wife. He had been a tobacco smoker, but had stopped smoking one year prior to admission. In the past, he had drunk alcohol heavily.

Physical examination noted a cachectic, acute, and chronically ill-appearing white male in moderate respiratory distress with a temperature of 100.6°F, regular pulse of 90/min, and respiratory rate of 40/min. The patient's skin was warm and dry with poor turgor and infected sebaceous cysts in the thoracic area and on the back. There were also multiple palpable nodules on both elbows and extensor surfaces of both forearms.

Mucous membranes were dry, sclerae slightly icteric, and conjunctivae pale. There was no lymphadenopathy. There was a II/VI systolic ejection heart murmur over the left parasternal border radiating to the left axilla and base of the neck. The lungs revealed decreased breath sounds more on the left side with basal crepitations bilaterally.

Abdomen was soft and nontender, and bowel sounds were present. Liver and spleen were enlarged. Guaiac test for occult blood in the stool was positive.

The joints showed deformities in all four extremities. There was an ulnar deviation at the wrist with swelling of proximal interphalangeal and metacarpophalangeal joints of both hands and feet.

Neurological examination revealed the patient to be alert and oriented to person and place but not to time. His speech was intact, but his memory was slow. There was marked muscle wasting, and muscle strength was decreased. He had no sensory deficits, and the deep tendon reflexes were intact.

Laboratory data revealed arterial blood gases with a pH of 7.468; pCo_2 (partial carbon dioxide pressure) of 35.1; pO_2 (oxygen partial pressure) of 47.5; HCO_3^- (bicarbonate) of 25.5; and O_2 (molecular oxygen) saturation 85.5 on 3 liters of O_2 administered by nasal canula. CBC (complete blood count) showed WBC (white blood cells), 2,200/cu mm; hematocrit, 22.8%; MCV (mean corpuscular volume), 77 fL; MCH (mean corpuscular hemoglobin), 23.5 pg; and RDW (red cell distribution width), 19%. There were 23% granulocytes or 0.5 x 10^3, and 69% lymphocytes. BUN (blood urea nitrogen) was 32 mg/dL; creatinine, 0.6 mg/dL; albumin, 2.5 g/dL; globulin, 4.6 g/L; alkaline phosphatase, 225 U/L; ALT (alanine aminotransferase), 58 U/L; Fe (iron), 36 µg/dL; Fe binding, 127 µg/dL; Fe saturation, 28.3%; erythropoietin, 43 mIU/ml; ferritin, 850 ng/ml; and haptoglobin, 76 mg/dL. The prothrombin time (PT) was 12.9 sec; the activated partial thromboplastin time (PTT), 35 sec; reticulocyte count, 2.5; and erythrocyte sedimentation rate, 45 mm/hr. The titer of rheumatoid factor was 1:20, and antinuclear antibody titer was less than 1:40. ECG (electrocardiogram) examination showed counter-clockwise rotation of the heart and P wave diphasic in lead II, III, and aVF.

The chest x-ray examination revealed extensive consolidation within the left upper and lower lobes compatible with pneumonia. No pleural effusion was seen. Underlying lung mass could not be excluded. There were no frank congestive changes. There was minimal infiltrate within the right midlung field. In addition, there was minimal volume loss to the left lung (**Figure 1**).

The patient was admitted to the intensive care unit and given intravenous antibiotics piperacillin and gentamicin. He also received multiple blood transfusions. An upper GI (gastrointestinal) series to evaluate for peptic ulcer or mass lesion was not conclusive. An EGD (esophagogastroduodenoscopy) was not done due to the patient's condition. Subsequent stool tests for occult blood, however, were negative. Liver and spleen isotope studies showed moderate to massive splenomegaly and moderate hepatomegaly compatible with diffuse liver disease.

Rheumatology consultation was obtained, and the impression was that the patient had Felty's syndrome. He was started on Plaquenil (hydroxychloroquine sulfate) and, later, on gold salts, and was continued on the previous antibiotic regimen.

Subsequent chest x-ray examinations, however, showed worsening of the right lung infiltrate with appearance of a right pleural effusion and pulmonary edema. The infiltrate/atelectasis in the left lung also persisted; an underlying neoplasm could not be excluded.

Bronchoscopy was done, revealing pneumonia and mucus plugging. Bone marrow biopsy showed decreased erythroid and myeloid precursors, but some maturation was still present. Megakaryocytes, plasma cells, and lymphoid type cells were

mildly increased. Iron stain showed marked reduction of stainable iron. Peripheral smears showed leukopenia with marked granulocytopenia. Platelets were also decreased. All cultures done in search of underlying pathogens were negative or inconclusive.

The patient had been receiving intravenous antibiotics for three weeks for continued leukopenia and low-grade fever. In the beginning of the fourth week of hospitalization, the patient became afebrile. He showed signs of clinical improvement, but was still neutropenic. Arrangements were made to transfer him to an extended care facility. The chest x-ray done on the day of his death showed some improvement in congestive heart failure; however, extensive infiltrate remained throughout the left lung. The same day, the patient suddenly developed a fever of 104.3°F, became confused and lethargic, and died.

Autopsy results showed: (1) extensive bronchopneumonia in the left upper and lower lobes with an abscess 3x2 cm in diameter in the left upper lobe; (2) extensive fibrous pleuritis on the left with fibrotic parietal pleura; (3) congestive splenomegaly (1.3 kg) with clinical signs of hypersplenism; (4) mild atherosclerosis of coronary arteries; (5) moderate left ventricular hypertrophy with mild biventricular dilatation; (6) reactive lymphoid hyperplasia in the hilar lymph nodes; (7) congested passive liver; (8) severe rheumatoid arthritis of all large and small joints; and (9) hypercellular bone marrow with mild myeloid hyperplasia.

Discussion

The presented patient fulfills the criteria for Felty's syndrome with regard to rheumatoid arthritis, splenomegaly, and neutropenia. In addition to the well-known triad, this patient had hepatomegaly, lymphadenopathy, weight loss, anemia, thrombocytopenia, and pulmonary manifestations with pleural thickening, effusion, and bronchopneumonia.

The natural history of Felty's syndrome is uncertain with respect to joint disease, extra-articular and hematological features, susceptibility to infection, and mortality. The condition is usually recognized in the fifth through seventh decades of life in patients who have had rheumatoid arthritis for 10 years or more.[7-8] Marked systemic involvement is characteristic of Felty's syndrome. The articular disease is usually more severe than in the average case of rheumatoid arthritis with greater deformity and erosion[9-10] and involvement of the small joints in the hands and feet, as well as large peripheral joints (e.g., knees, shoulders). The disease, however, can involve any joint of the body, and there are many examples of mild joint involvement.[11-12]

Patients with Felty's syndrome tend to have more extra-articular disease manifestations than those with rheumatoid arthritis.[9-11] Symptom frequency varies: 76% for rheumatoid nodules, 68% for weight loss, 34% for lymphadenopathy, 19% for pleuritis, and 84% for episcleritis.[6] Weight loss, leading to severe emaciation as in the case of our patient, was mentioned by Felty.[1] It often occurs for several months before the diagnosis of Felty's syndrome is made.

The splenic enlargement in Felty's syndrome is extremely variable, with weight ranging from 260 g to 2,420 g.[8,11,13,15] Our patient's spleen weighed 1,300 g. Splenomegaly appears to relate to the diffuse lymphoid hyperplasia seen commonly in rheumatoid arthritis.[16-17] There is no correlation between spleen size and degree of granulocytopenia.[4,8-10,18]

The mechanism of the leukopenia in Felty's syndrome remains controversial. There is a relative and absolute granulocytopenia, as in our patient, in contrast to systemic lupus erythematosus, in which lymphopenia is a more prominent feature. Postulated mechanisms include humoral factors,[19-21] increased neutrophil margination,[22-25] phagocytosis of neutrophils by the spleen,[26-27] and impaired production of granulocytes.[28-30]

Increased infection susceptibility persists in Felty's syndrome patients with and without splenectomy[9,10,11,15,25] and is probably related to several factors in addition to granulocytopenia (this suggests the importance of an intrinsic defect of granulocyte function and other normal defense mechanisms, that is, diminished granulocyte reserve,[26-27,31-32] defective phagocytosis,[23,26,33] chemotaxis,[34-35] and killing[36-37]).

Hypercellular bone marrow with myeloid hyperpiesia, which was noted in the presented case, is a fairly typical presentation in Felty's syndrome,[8-11] which may reflect an impaired myelopoietic response or early release of mature form. In some cases, the bone marrow may show no abnormalities.

Almost all Felty's syndrome patients are anemic, and our case is no exception; hypochromia is the rule. It represents the anemia characteristic of chronic disease, which may be due to failure of iron utilization with an additional component of shortened red blood cell survival, which is corrected by splenectomy.[38] Reticulocyte count elevation is common,[10] as was observed in our case. The platelet count is normal or somewhat reduced, in contrast to the thrombocytopenia seen in active rheumatoid synovitis.

Therapy for Felty's syndrome is a matter of controversy. Thrombocytopenia usually improves after splenectomy, as does anemia. The basic illness should be treated in the same manner as it would in the absence of Felty's syndrome. Frequently, granulocytopenia may improve during treatment with gold or D-penicillamine,[29,39-40] and high-dose parenteral testosterone[41] or lithium[42] may stimulate granulopoiesis and, in the case of the former drug, may also reduce the infection rate in a small number of patients. The use of low-dose oral methotrexate,[43-44] cyclophosphamide,[45] azathioprine,[46] as well as plasmapheresis[47] has also been advocated for Felty's syndrome patients. Recently, papers have been published reporting favorable response of granulocytopenia to treatment with low doses of cyclosporine A in patients with Felty's syn-

drome.[48-50] Further studies, however, are required to evaluate the long-term responses to this drug.

Baltimore's Best Internal Medicine Opportunities

The Greater Baltimore Medical Center (GBMC), a 372-bed teaching hospital located in suburban Baltimore has several outstanding clinical opportunities for general internists.

Faculty Practice–full-time position in GBMC's Internal Medicine Residency Program. Flexible balance of activities include in-patient and ambulatory teaching, clinical research and private practice. Faculty practice plan provides collegial work environment amongst core faculty of five internists/educators. Program is focused on primary care curriculum. Excellent salary with incentives and full benefit package.

Private Practice–several full-time office based community practice situations. Join in partnership with existing and substantially active internists who seek associates to participate in the continued growth of their practice. Call coverage schedule permits perfect balance between professional and personal lifestyle. Excellent compensation and benefits.

Physicians who are interested in exploring the best internal medicine opportunities should call Tom Battles at 410/828-3649 or send curriculum vitae to:

STRAIGHT Forward

INFORMATION FOR AUTHORS

Straight Forward, a quarterly publication by the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland, informs Maryland physicians and other health care providers of developments in the areas of substance abuse, mental health, impairment, and recovery.

To accomplish this goal, the editorial consultants seek original informative or philosophical manuscripts on addiction, recovery, practice/patient management, and mental health. Calls for manuscripts on specific subjects will appear in future *Straight Forward* issues.

REQUIREMENTS FOR ARTICLES

1. Maximum length 2,500 words (about 10 double-spaced typed pages)
2. For references to other works within an article, cite the following information:
   a. author(s),
   b. complete title of work cited,
   c. title of journal, publication, and publisher,
   d. year of publication,
   e. volume number,
   f. first and last page number.
3. Submit two copies of the article, typed, double-spaced, with numbered pages and principal author's name on each page.
4. If possible, accompany the hard copies with an IBM-compatible WordPerfect disk (3 1/2" or 5 1/4").
5. A transmittal letter must accompany each submission and must contain the following elements:
   a. the signature, full name, degree, title, and affiliation of the author(s);
   b. a statement that the author(s) participated in forming the concept and drafting the article and take responsibility for its content and accuracy;
   c. a statement granting *Straight Forward* copyright if the article is accepted for publication.

For a copy of a transmittal letter to which you can add information specific to your article, call 410-962-5580 or 1-800-992-7010.

Send submissions to *Straight Forward*
1204 Maryland Avenue
Baltimore, MD 21201

The managing editor will acknowledge receiving your submission immediately, and will notify you of its status for publication as quickly as possible, generally within a month. Thank you for your interest in *Straight Forward.*

The editorial consultants currently seek articles on the following topics:

- substance abuse issues specific to anesthesiologists,
- stress inherent in transitions in medical practice, for example, in opening a practice, in changing specialty, in preparing for retirement.

Desquamative interstitial pneumonia: a case presentation

Minesh B. Patel, M.D.

Dr. Patel, at the time of this study, was a junior resident at Harbor Hospital Center, Baltimore, Maryland.

ABSTRACT: *A 25-year-old African-American woman presented in the emergency room of a community hospital complaining of shortness of breath. The patient was admitted with a diagnosis of atypical pneumonia. Her respiration worsened despite intravenous erythromycin, nebulized albuterol, 40% oxygen via ventimask, and guaifenesin. An open lung biopsy revealed pulmonary tissue showing interstitial fibrosis with lymphocytes and histiocytes scattered within the fibrous tissue. Numerous alveoli contained mononuclear cells as seen in desquamative interstitial pneumonia. The patient did not respond to methylprednisolone and died on the eighteenth hospital day.*

Desquamative interstitial pneumonia (DIP), originally described by Liebow et al,[1] is characterized by a marked increase in intra-alveolar mononuclear cells with minimal interstitial fibrosis. Although DIP etiology is not known, its histologic and radiographic differences, as well as its good response to steroid therapy, appear to warrant its separation from the interstitial pneumonia group and from certain conditions in which there is extensive accumulation of alveolar cells or mononuclear elements in the lungs.[1,2] This report reviews diagnosis and treatment options for this specific disease entity.

Case presentation

This was the first admission for this 25-year-old African-American woman, admitted with a chief complaint of shortness of breath. She had no significant past medical history. The patient was in her usual state of health until one month prior to admission, when she started having cough production of yellow sputum. She denied having any fever, chills, or shortness of breath at that time. Her cough continued, and one week prior

Figure 1. Chest x-ray shows patchy interstitial densities more prominent in the lung bases and bilateral hilar prominence.

to admission, she started having dyspnea on exertion and could only walk two blocks.

One day prior to admission, her dyspnea worsened, she started complaining of right-sided pleuritic chest pain, and she also had a fever. On the day of admission, she woke up feeling weak, became short of breath with mild exertion, and felt feverish. She thus presented to the emergency room of a community hospital for further evaluation.

She had no known allergies, worked as a security guard, had a five-year smoking history, drank alcoholic beverages occasionally, and denied illicit drug use. Family history was positive for diabetes.

Physical examination revealed a well-developed, well-nourished, African-American female in moderate respiratory distress. Her vital signs on admission were: blood pressure, 100/70 mm Hg; pulse rate, 88/min; respiratory rate, 30/min; and temperature, 99.3°F. There was no jugular venous distension. She had bibasilar inspiratory crackles. Heart and abdomen were within normal limits. There was no peripheral cyanosis or edema. She had clubbing of the fingers.

Admission laboratory data showed: glucose, 85 mg/dL; blood urea nitrogen, 5 mg/dL; sodium, 136 mEq/L; potassium, 4.6 mEq/L; chloride, 99 mEq/L; and carbon dioxide, 23 mEq/L. Complete blood count (CBC) revealed: hematocrit, 36%; white blood cells, 15,200/mm^3 with 80% granulocytes, 17% lymphocytes, 3% monocytes, and platelets, 458,000/mm^3.

Arterial blood gas (ABG) on room air showed: pH, 7.41; partial carbon dioxide pressure (pCo_2) 34.4; oxygen partial pressure (pO_2), 66.7; and bicarbonate (HCO_3^-), 22.1. Chest radiograph revealed patchy interstitial densities in both lungs, more prominent at bases and bilateral hilar prominence (**Figure 1**). Electrocardiogram was within normal limits.

Hospital course

The patient was admitted to a medical floor with a diagnosis of atypical pneumonia. A Gram stain of sputum showed many leukocytes, epithelial cells, and gram positive cocci in pairs. She was started on intravenous erythromycin and placed on oxygen via nasal canula at 4 liters per minute. A blood specimen for mycoplasma and legionella was sent for evaluation.

On the second hospital day, she felt better at rest; however, upon walking to the bathroom, she again became dyspneic. On the third hospital day, she was scheduled to have a bronchoscopy, but the patient denied consent. Blood for antinuclear antibodies, rheumatoid factor, viral titer, and human immunodeficiency virus (HIV) antibody tests was collected since the patient was not improving. A computerized chest tomogram revealed hilar and mediastinal lymphadenopathy with interstitial, alveolar, and diffuse parenchymal changes. No definite mass was noted. The patient continued to have dyspnea even at rest. All her blood work returned negative, including blood cultures.

As her respiratory status was worsening despite intravenous erythromycin, nebulized albuterol, 40% oxygen via ventimask, and guaifenesin, the patient was transferred to an intensive care unit. Her blood gases on 40% showed pH, 7.41; pCO_2, 36; pO_2, 59.5; and HCO_3^-, 23. Respiratory rate was 40+/min, and chest radiograph showed diffuse interstitial infiltrate throughout both lungs suggesting interstitial pneumonitis (**Figure 2**).

Figure 2. Chest x-ray shows diffuse interstitial infiltrate suggesting interstitial pneumonitis.

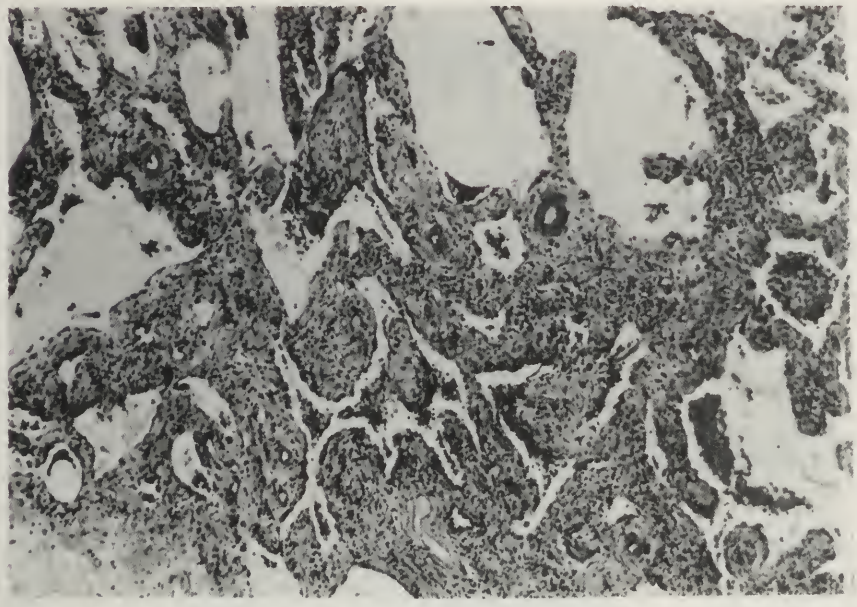

Figure 3. Pulmonary tissue shows interstitial fibrosis with lymphocytes and histiocytes scattered within the fibrous tissue.

She was intubated at this point, as we could not keep her adequately oxygenated. She was started on intermittent mandatory ventilation (IMV) at the rate of 14/minute with tidal volume 700 cc, fractional inspired oxygen (FiO_2) 100%, and positive end-expiratory pressure (PEEP) of 5 cm of H_2O. Her ABG on these settings was pH, 7.36; pCO_2, 49; pO_2, 271; and HCO_3^-, 25. However, her pO_2 continued to drop thereafter, and it was decided at this point that an open lung biopsy should be performed to make a definitive diagnosis.

She subsequently underwent wedge resection of the right lower lobe. The specimen was sent in sterile condition to the pathology department. The biopsy revealed pulmonary tissue showing interstitial fibrosis, with lymphocytes and histiocytes scattered within the fibrous tissue. Numerous alveoli contained mononuclear cells (histiocytes and pneumocytes) as seen in DIP (**Figure 3**). She was immediately started on high doses of steroids (1 g of methylprednisolone in divided doses for three days, then tapered slowly). She did not respond to methylprednisolone and, a week later, started having hemodynamic complications (hypotension). High levels of PEEP had to be used to maintain her oxygenation. On the eighteenth hospital day, she expired.

Discussion

DIP is a disease of unknown etiology. The histologic pattern may vary from dense alveolar septal fibrosis with little or no inflammation to a predominance of lymphocytes and/or plasma cells in the interstices and minimal fibrosis. A desquamative reaction may also occur where alveolar macrophages and type II pneumocytes completely fill alveoli in association with minimal septal fibrosis.[3]

As the clinical picture and radiologic data do not help with differential diagnosis of this condition, and transbronchial biopsy obtains a small specimen, making it difficult to differentiate between types of interstitial pneumonia, an open lung biopsy is indicated.[4] It is important to emphasize that not all peripheral open lung biopsies are representative of the entire lung. Surgeons performing open lung biopsies should avoid acutely angled areas of pulmonary parenchyma, such as the lingula, since these regions frequently demonstrate an abnormality even in normal persons.[3,5]

The clinical presentation varies widely. The most common presenting complaint is dyspnea on exertion and cough productive of small amounts of mucoid sputum. Generalized symptoms, such as weight loss, do not appear until late stages of the disease.

Abnormalities on physical examination are limited to tachypnea, crackles at the lung bases, clubbing, and exercise-induced cyanosis. The chest radiograph typically shows a diffuse reticular or reticulonodular infiltrate with accentuation at the bases. Pleural involvement is rare.

In order to make a definitive DIP diagnosis, a thorough history, complete physical examination, serological tests, and fiberoptic bronchoscopy are necessary to exclude collagen vascular disease, pneumoconiosis, hypersensitivity pneumonitis, neoplasm, and infection. Once these have been ruled out, open lung biopsy should be performed without delay.

Once the diagnosis has been established, the standard therapeutic approach is to use high doses of corticosteroid.[2,3,6] The extent of fibrosis has been shown to be resilient to therapy, while mild fibrosis has been more responsive.[5] These results are based on studies that are retrospective, uncontrolled, have a limited number of patients, or use varying dosage or therapy durations.

Recently, a randomized prospective trial of cyclophosphamide as adjunctive therapy in idiopathic pulmonary fibrosis (including DIP) demonstrated that cyclophosphamide (100–120 mg per day) combined with alternative day prednisolone (20 mg every other day) was no more beneficial than high dose prednisolone (60 mg/day and then tapered) alone.[7]

There was a suggestion of improved survival in patients on cyclophosphamide–prednisolone. This result, however, was shy of statistical significance ($p > .1$). Also in this study,[7] many patients on cyclophosphamide developed neutropenia, thrombocytopenia, or hemorrhagic cystitis.

A prospective, randomized, double-blinded placebo-controlled treatment trial of idiopathic pulmonary fibrosis (including DIP) using azathioprine–prednisolone is currently in

progress. Early results from this study being conducted by G. Raghu, W.J. DePaso, K. Cain, et al indicate that azathioprine is associated with an improvement in gas exchange.

In summary, DIP should be considered in differential diagnosis of dyspnea of unexplained etiology. An open lung biopsy should be done as soon as possible to make a definitive diagnosis. Once the diagnosis is confirmed, high doses of steroid should be instituted.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

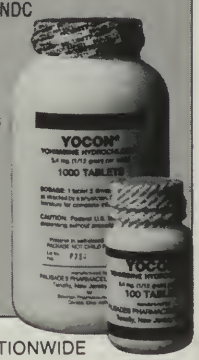
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Vignette of medical history: Lazaretto Point

Joseph M. Miller, M.D.

Dr. Miller is a retired surgeon from Timonium, Maryland.

ABSTRACT: *During the Black Death's reign in the fifteenth century, a number of installations providing care for lepers were converted into quarantine stations. Known as lazarettos or pesthouses, they served as disinfection way stations for travelers and, later, as hospitals for those diagnosed with pestilential diseases (e.g., smallpox, typhus, cholera). Beginning in the late 1700s, quarantine stations and pesthouses were established in the Baltimore area, including Hawkins Point, Lazaretto Point, Fairfield, and Leading Point.*

Lazaretto, an unusual medical name, is ingrained in the nomenclature of Baltimore's geography. Just north of the eastern entrances to the Fort McHenry and Baltimore Harbor tunnels is a site well known to previous generations of Baltimoreans but virtually forgotten at present (**Figure 1**). Lazaretto Point and its lighthouse guarded the entrance to Baltimore's inner harbor for many years. The curious name recalls a period of history stretching back about 550 years and is derived from the practice of quarantine.

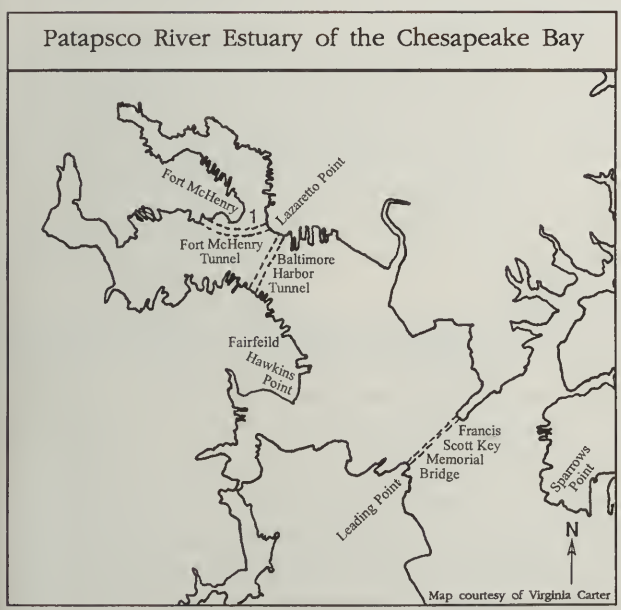

Figure 1. Patapsco River Estuary of the Chesapeake Bay

Few present-day internists or surgeons can recall practice without the powerful help of the ever-expanding world of immunology and chemotherapy. Before this era, deaths occasioned by infectious disease were legion, and, too frequently, the physician was virtually helpless when confronted by them. Well before the discovery of the cause of these ailments, however, health officials grasped the idea that infection could be carried and spread by people and goods coming from infected areas.

Infectious disease importation was an acute source of anxiety to the European nations trading with the East in the Middle Ages.[1,2] Venice, one of the principal places where East met West, initiated steps in 1448 to safeguard against plague when it authorized the formation of a sanitary council. Potentially infected ships, goods, and

people were to be isolated on an island in Venice's lagoon. Having experienced more than 70 plague epidemics in 700 years, Venice was more than ready to seek any type of protection.

The Venetians believed that 40 days were required to dissipate the causes of infections, and so the term "quarantine" (derived from the Latin *quadraginia*, meaning 40 days) was born. Plague, cholera, typhus, relapsing fever, smallpox, and yellow fever were the diseases demanding attention.

During the Black Death's reign in the fifteenth century, a number of installations providing care for lepers were converted into quarantine stations. In Venice, the house of Saint Lazarus was the first such area to be used in 1448 and was called a "lazaretto." The term was derived from the Italian *lazzaro,* meaning leper. The Church of Santa Maria di Nazaret was also used as a pesthouse (house or hospital for persons infected with pestilential diseases) in the fifteenth century. (Lazarus, incidentally, was the name of the poor man full of sores in the well-known Biblical parable.) All merchants and travelers from the Levant (lands bordering the eastern shores of the Mediterranean Sea) were required to remain at the station for a designated time before being admitted to the city. Other marine cities soon followed Venice's example.

Subsequent recognition that these diseases could also travel by overland routes led to the creation of frontier disinfection stations. Persons, merchandise, and mail were isolated and detained according to local regulations.

Later, in the American colonies, New York, Philadelphia, Boston, and Charleston were exposed to communicable diseases, particularly smallpox, brought in by crews and passengers of incoming ships.[3] To prevent the spread of the disorders, towns established quarantine stations. Boston had one in 1717, Philadelphia in 1742, Charleston in 1752, and New York before 1757.

Maryland, too, recognized the dangers associated with infectious diseases early in its history as it was the first colony to enact a quarantine law in 1766.[4] Additions to the basic law were made in succeeding years. In 1792, Dr. John Ross was appointed to control quarantine by sea, and Dr. John Worthington, by land.

Baltimore, itself, although acting a little later, was well aware of the dangers of an epidemic. In 1793, the General Assembly of Maryland, through the governor, authorized the appointment of one or more skillful physicians to visit and examine all foreign vessels and those coming from suspected epidemic areas and, if necessary, exert the full power of quarantine upon the ill.[5] Vessels with diseased patients would not be brought above Hawkins Point. The 1793 law also provided for the erection of a temporary hospital for the reception of such sick people as a physician might direct there to obtain better accommodations or cure.

In 1801, an act for erecting a lazaretto near the waters of the Patapsco River was passed by the Assembly.[6–8] Authorization was provided for the purchase of 10 acres of land, and, if a satisfactory price could not be reached, the power of condemnation was granted. A place appropriate for the reception of individuals with the plague or other malignant contagions was necessary to prevent their spread.

The hospital, built at Hawkins Point due west across the Patapsco River from Sparrows Point and under the jurisdiction of the Baltimore City Health Department, was probably used from 1795 to 1830. During some of that period, a portion of the United States Marine Hospital was equipped for the care of patients with contagious diseases. This particular building, constructed shortly after 1801, was located at Lazaretto Point just across the river from Fort McHenry. The site was destroyed by fire in 1836, and then the US Marine Hospital could not even provide hospital facilities for sailors having ordinary diseases for an extended period of time.

About 1845, the city constructed a new quarantine station called the Marine Hospital in Fairfield just south of Fort McHenry. Designed primarily to care for immigrants, a portion of the building was set aside as a pesthouse for cases of smallpox and typhus fever of city origin. The name "Marine Hospital" was a misnomer as the site was a hospital for immigrants and a pesthouse for the city.

In 1851, the quarantine station was moved to Leading Point about eight miles below Fort McHenry. Two wooden structures were erected—one for sailors and passengers with contagious diseases, and the other to serve as a pesthouse for the city.

The city council had direct control of the institution as shown by a statute enacted on June 2, 1862, which provided for the appointment of a "suitable person, to be known and designated as the Marine Hospital physician" on an annual basis.[9] The individual had to be "a legally authorized practicing physician." All of the physician's duties were carefully and specifically defined by law.

In 1886, public health continued to demand the attention of Maryland legislators.[10] The need for more efficient means for protecting constituents' welfare resulted in further definition of the duties of the State Board of Health and creation of local boards in the counties. These insular groups were to be cognizant of all unhealthy nuisances within their sanitary jurisdiction and take the necessary steps to restrict or suppress these diseases.

In retrospect, maritime quarantine was not particularly effective in Baltimore. In nearly every year from 1794 to 1807, yellow fever epidemics were seen. Although such regulations were lacking between 1807 and 1821, yellow fever appeared only in 1819 and 1821. In addition, hospital facilities for isolation were hopelessly inadequate as only a few patients could be treated. As the city's hospital accommodations grew, many individuals on the steamship lines with scarlet fever, measles, and diphtheria were admitted directly from the ships to the hospitals.

Since 1845, quarantine has served a good purpose, however, in preventing the ingress of the severe types of malaria from Central and South America. Curiously, many patients with smallpox and typhus fever sent from the city to the old Marine Hospital died of malaria contracted while at the hospital.

The Lazaretto Lighthouse of Baltimore was also located on the point of the same name.[11,12] Built in 1831 for $2,100, the cylindrical brick structure was a major navigational aid marking the entrance to Baltimore's harbor. The tower stood for 95 years until it was replaced by a new structure, which remained in place until 1954. Four years later, the property was sold for commercial use, with all evidence of the operation of the point as a lazaretto and a lighthouse having vanished. The name, however, remains on present-day maps.

You'll love working with our locum tenens physicians and allied health care professionals.

WE GUARANTEE IT.

CompHealth has thoroughly credentialed physicians and allied health care providers from more than 40 fields of specialization available to provide locum tenens, or temporary, staffing assistance when and where you need it.

Plus, we have the standards and experience to guarantee your satisfaction each time we place a member of our medical staff in your practice or facility. It's the closest thing you'll find to a risk-free way to cover for absent staff members, "try out" a potential new recruit, or take care of your patients while you search for a new full-time associate.

Call us today to arrange for quality locum tenens coverage, or to discuss your permanent recruiting needs.

At The P·I·E Mutual, doctors rule. They sit on managing boards that consider new applicants. They form committees that review the merits of claims. Who knows better? And who cares more about controlling costs than people who themselves are paying premiums? Which helps explain why we can offer such attractive discounts to loss-free members. And how we've attracted 15,000 doctors, and become one of the largest medical professional liability monoline insurance companies in America.

It's Time to Re-evaluate Your Malpractice Coverage

WILL THE "TAIL" END UP WAGGING THE DOC?

GOOD NEWS . . . BAD NEWS Earlier, when the Health Care Reform package was being formulated, some proponents called for the creation of "Enterprise Liability" as a method of malpractice reform. For now, this proposal seems dormant but no one knows if or when it might resurface. The *Good News* is that this would shift liability away from doctors and hospitals to health insurers and HMOs. In effect, it would do away with the need for physicians and surgeons to purchase individual malpractice insurance. The *Bad News* is that such an action would undoubtedly force physicians and surgeons insured under a Claims-Made policy to purchase costly "Tail" coverage far sooner than anticipated – possibly at a cost as much as four times their last policy's annual premium.

FREE "TAIL" FOR RETIREMENT Now what about all the hype you hear about "Free Tail for Retirement" from insurers selling Claims-Made coverage? For years we've been telling physicians it doesn't anticipate unforeseen circumstances that might trigger a need to purchase "Tail" coverage. These range from simple professional changes which require a switch to another insurer to other more complicated scenarios. *Little did we know that possible federal government action could also trigger such a need to purchase costly "Tail" coverage.*

TOMORROW'S ANSWER TODAY There is only one coverage available in Maryland today that doesn't hold physicians captive...that does provide this critically important "Tail" coverage at no additional cost — Princeton Insurance Company's "Occurrence Plus" policy. What's more, Princeton also offers "Prior Acts" coverage (which replaces your need to purchase "Tail" coverage from your existing Claims-Made company) at a cost that may be less than half of what your present insurer charges. Princeton is the seventh largest malpractice company in America and has ratings from both Standard and Poor's (A) and the A.M. Best Co. (B++).

ACT NOW TO SAVE Take control of your malpractice costs. In most cases, the annual cost of a Princeton policy — which includes "Tail Free" coverage — is similar to what Claims-Made companies are charging for coverage that doesn't include "Tail" protection.

To obtain a free, no obligation comparison of coverage and cost, simply detach this letter, complete the brief form on the reverse side and either fax it or mail it to us today. For an immediate response, simply pick up the phone and call us.

An Important Message for Physicians and Surgeons

WILL THE *"TAIL"* END UP WAGGING THE DOC?

If you have been confused about your medical malpractice insurance coverage, particularly as it applies to "Prior Acts" and what circumstances might trigger your need to purchase costly "Tail" coverage, you should be aware that recent Health Care Reform package-related discussions have further complicated the issue.

A brief overview is provided on the reverse side.

To learn more about how your present medical malpractice policy handles these issues - and what cost consequences may follow — we are offering a *free, no obligation analysis* of your current coverage and a cost comparison with Princeton Insurance Company's "Tail Free" "Occurrence Plus" policy.

To find out how your present coverage compares,
simply complete the brief form below and mail or fax it to our offices.
For immediate information, call 1-800-458-7295.

YES, I WANT MORE INFORMATION!

When the Doctor is Out

Leslie R. Miles, Jr., M.D.: Physician and Priest

"I am active. I'm not sitting around even though I retired."

These remarks by Leslie R. Miles, Jr., M.D., greatly understate his situation. The Allegany County family practitioner and Episcopal priest provides living proof of the adage that says if you want a job done, ask a busy person to do it.

Although Dr. Miles became a physician first, when he became an Episcopal priest, he considered one job equal to the other. In childhood, Dr. Miles had no burning desire to become either a physician or a member of the clergy. How then did he happen to become both? Dr. Miles began with the story of how he became a physician.

Figure 1.
Dr. Miles discusses a patient with Paula Booth, R.N., at the Egle Nursing Home in Lonaconing, Maryland.

"When I got out of high school, the war was going on, and Roosevelt thought he couldn't do it without me, so he suggested that I go in the service, which I did. I wound up in a combat engineer battalion where everyone is some sort of technician—either a truck driver or a rigger or a carpenter or something like that. Fresh out of high school with an academic course, I didn't have any training in anything, so they suggested, 'why don't you become a medic?' I didn't think much of that, but someone said the medics sit around while everyone else does the work, and that sounded like a good deal, so I said, 'All right, I'll go for that.' So you might say, I sort of stumbled into it."

"It sort of flattered my ego, all these guys calling me Doc. I attended to all their minor complaints as well as wounds and injuries and so forth. When I got out of the service, I had the GI bill coming, so I decided to see what I could do to become a physician."

Following his graduation from the University of Maryland School of Medicine in 1953, Dr. Miles completed an internship at Winchester Memorial Hospital in Winchester, Virginia. "In those days, you could do a one-year rotating internship, and then go out and do most anything. When you were an intern, where there were no residents, you were top dog. On the surgical service or the medical service, you were the chief resident, and you had to do it. You had to assume the responsibility. We had a good medical staff, and I really thought that I received a good education from the experience. When I finished my internship then, 'Hey, here I go!' I launched out into the world to do my thing."

Dr. Miles's thing was to practice family medicine in a small community that needed a physician. "I wanted to go someplace that needed a physician. Everybody said I was nuts. There weren't too many of us in my class going into family practice."

The narrow western Maryland valley that contains three towns—Midland, Lonaconing, and Barton—with a combined population of about 6,000 people, had just one physician in 1954. Dr. Miles joined him in November, only to have the physician leave the

following July to enter a residency program. For the next 22 years, Dr. Miles practiced by himself. Finally, a young man from Lonaconing finished college, medical school, and a three-year family practice residency and joined the practice.

In 1954, Dr. Miles paid $92 a year for malpractice insurance, and he did almost everything: obstetrics, surgical assisting, minor orthopaedics, general medicine, and, on occasion, he even gave anesthesia. "My wife tells me that for eight or nine years, I never did take a day off. Beginning at 7:30 in the morning, I made rounds at the hospital where I usually had about seven or eight patients and assisted at surgery, and I probably averaged at least two or three house calls a day. Beginning at noon I would see between 40 and 50 patients a day in the office. I had a pretty busy schedule."

"Assisting in surgery took time, and I was on call all the time. The nice thing about the people was that they appreciated that I was there, and from midnight till seven in the morning, I rarely got calls. They would suffer it out in the middle of the night because they didn't want to bother me."

When he started in practice, Dr. Miles had privileges at a small hospital in Frostburg with about nine other general practitioners and a surgeon on the staff. He manned the emergency room for two weeks at a time, treating anything and everything that came in. When Dr. Miles joined the staff at Sacred Heart Hospital, he helped to form the family practice department, serving as its first chairperson. From there, he became chief of the medical staff, and from that position, he moved on to become the medical director.

"They convinced me to take it on a part-time basis, which I agreed to do. But after about a year and a half of that, I said, 'Look, this is not a part-time job and neither is my practice, and one or the other has got to go.'" The hospital struck a bargain with him to become the full-time medical director. "I quit practice but managed to get another physician in to help out the fellow who was working with me."

After nine years as medical director of Sacred Heart Hospital, he retired. "I kind of loafed around for six or seven months. Then they built a new 60-bed nursing home in Lonaconing, and they got after me to be medical director. So currently, that's what I'm doing."

This may sound like a busy but typical career pattern for a physician in family practice, but Dr. Miles added to his medical career a vocation as an Episcopal priest. "I became an Episcopalian because my wife's father was an Episcopal priest, and we were married in the Episcopal church. We didn't go to church until after we had our second child. Then we decided maybe we better have a little religious education."

Just as in his medical career, one thing led to another; Dr. Miles became a lay reader and then a chalice bearer at St. Peter's. Founded in 1839 by the English owners of the early coal mines in the region, it is the oldest church in the valley. Small parishes like those in western Maryland experience frequent turnover of clergy, Dr. Miles explained. "And in our church, as well as adjacent churches, when there would be a vacancy, I would fill in. As a lay reader, I could do morning prayer."

A family tragedy intensified Dr. Miles's interest in religion—the death of a son at the age of three. "Some sort of disaster makes you either more religious, or you say the

Figure 2.
Dr. Miles heads the congregation at St. Peter's Church in Lonaconing, Maryland.

heck with the whole thing. I went with the more religious side of it."

Although Dr. Miles disagreed frequently with the parish priest who preceded him at St. Peter's, it was this very priest who told the bishop that the only way St. Peter's Church, with only 12 communicants, would survive was if he would ordain Dr. Miles.

"I didn't know this until the bishop put pressure on me, and I turned him down every which way, but I ultimately wound up doing what I am doing now. I spent a year with two priests. We had lunch every Wednesday and spent the whole afternoon discussing theology, and they gave me a bunch of books and said read these, and we will see you next Wednesday."

Figure 3.
Dr. Miles measures blood pressure of Ms. Lily Ross, one of his patients at Egle Nursing Home.

"It was a rather strenuous year because I was still practicing family medicine full time and doing all this reading. I would be up till 2, 3, 4 o'clock in the morning reading, and then I would get up in the morning and go to work. It was kind of tough on the married life, but we survived. When I was ordained in 1972, virtually every parishioner was also a patient, but it worked out fine."

Dr. Miles has served at St. Peter's ever since. "Now we have 97 communicants and about 24 in Sunday school. We have a lot of young people coming up, which speaks well for the future."

After 20 years in the priesthood, Dr. Miles finds it impossible to keep his two careers separate. "My religious training has helped me tremendously to get people to accept the misfortunes of life. If someone has a terminal illness, I can advise him or her medically and spiritually as well. The same thing happens in reverse; when dealing with a parishioner, I can counsel him or her about a medical problem."

Dr. Miles related an example. Recently, when a parishioner received communion, Dr. Miles noticed his pale and waxy look. "I thought this fellow looked terrible, and his hands looked awful, so after a couple of weeks of this, I went to his house." After a cursory look and some questions, Dr. Miles persuaded the man to have blood work done, which revealed leukemia. "The man was referred to an oncologist, and now he's doing fairly well. So you might say from my ministration as a priest, I am able to recognize a pathological situation in a parishioner and get him or her into medical treatment."

"I tell patients and parishioners, 'If you want to get well, it takes your physician to work with you; it takes you to have the courage and strength; and it takes God. I can guarantee you that God doesn't let you down, and I can guarantee you your physician isn't going to let you down.' I never pray for anyone to be cured. I say God's will be done because this is what will happen whether I want it to or not, and I pray for courage and strength and patience. I didn't pray to have the blizzards of '93 go away. I prayed to have the strength to go out and shovel."

"I think the difference between the Old and the New Testaments is that in the Old Testament, God talked to prophets, and they went out and told people, but the people didn't listen too well or too long. Ultimately, God said, 'This doesn't work, I've got to do something else, so I'll go down there myself and show them how it works.

I'll show them and I'll talk to them.' Which he did, and they took him out, and they strung him up. So God said, 'What more can I do? I've sent you prophets; I've talked to you; I've shown you. Now you're on your own. I'm not parting any Red Seas these days.' It's like your father sends you out to get a job, saying, 'Now I'll give you support. I hope you do a nice job. If you need some advice, call on me, but fella, I'm not giving you any more money, and I'm not putting a roof over your head. You've got to do things yourself.'"

"So we have a father we can talk to anytime. We can ask for advice. I figure that when any little tragedy happens to me or to anybody else, He sits up there and cries just as hard as if my earthly father were there and saw this tragedy. When my son died, my father was still living, and he was tremendously upset. But he couldn't give me another son. The only thing he could do was pat me on the back and say, 'I'm with you all the way.' And this is the way I think God works."

Dr. Miles does not find any greater satisfaction in being a member of the clergy than in being a physician, but he sees it as two different ways of looking at people. "There is a spiritual and a physical side; as a physician, I enjoy what I do. It's very pleasing to deliver a baby and see the parents smile and see the baby do fine. There's a medical satisfaction in curing some condition or even just controlling it satisfactorily. There's also much clerical satisfaction in, if you want to put it bluntly, saving a soul and helping somebody to understand God and the life he or she leads. I can get carried away and think I am a little closer to God than anybody else, but I'm not."

Like medicine, the main drawback of a clerical career is its demands on time. "Being a cleric involves much more than an hour Sunday mornings. There are a lot of night calls; there are weekend calls; there are a lot of times when I jump and run, and I can't leave without getting some sort of coverage. If I go away, I've got to get somebody to cover me in both fields."

Dr. Miles said that the nicest thing about his current schedule is not having to live according to the clock. "I go to the nursing home five days a week, but whether I get there at 9, 9:30, or 10:00 a.m. doesn't make a whole lot of difference, and I don't get the calls at night that I got when I was doing general medicine. The same applies as far as church is concerned. I can set my schedule and work around the visitations and calls, but there are still plenty of meetings."

"I am still very active in the county medical society and the state medical society, so there are meetings there. I have been the president and am now the treasurer of the ministerial association in our community. I'm also on the county zoning appeals board that meets once a month to listen to appeals for variances in zoning laws."

"I've enjoyed it," Dr. Miles concluded, "but I am glad it's at a slower pace at this point. We have a swimming pool, and one day last summer when things were a little slow, I was out by the pool lying in the sun and dipping in the pool when I got hot. This other priest drove by and said, 'Man that looks like a rough life.' I said, 'When you get organized like I am, you have no problem.'"

If you want a job done, ask a busy person to do it.

CORA TETER, M.S.

A Moment with Endocrinology and Metabolism

Treating a hot thyroid nodule

Dear Consultant:
I would like to ask about treatment for a patient with a hot thyroid nodule. The patient is a 45-year-old woman whose gynecologist found a 2 cm thyroid nodule in the right lobe of the patient's thyroid. The patient was referred to me. I conducted thyroid function tests and a thyroid scan. Blood test results were normal, including a T_4 (thyroxine) level of 8.7 µg/dL (5-12), T_3 (triiodothyronine) resin uptake of 32% (25%–35%) and a TSH (thyroid-stimulating hormone) level of 0.8 µU/mL, (.3–5). Thyroid scan showed the nodule to take up technetium more than the rest of the gland, but without suppression elsewhere.

Please advise me as to therapy. Does the patient need surgery or radioactive iodine, or would she benefit from thyroid hormone suppression?

Dear Doctor:

Evaluation and treatment of a functioning thyroid nodule contains many options and no absolutes. The clinical considerations are the following:

- Does the size of the nodule create a problem? (That is, does it cause airway or esophageal compression or other local discomfort.)
- Is the nodule that is overproducing thyroid hormone causing hyperthyroidism?
- Could the nodule be malignant?

The answers to these questions provide the therapeutic choice. If the nodule is large enough to cause compressive symptoms, then therapy should be undertaken. Options include thyroid hormone, radioactive iodine, and surgery.

Hot nodules are not likely to suppress with thyroid hormone, and a real risk of causing exogenous hyperthyroidism exists. Since the rest of the gland is not suppressed, nor is the TSH, there is a slight chance of suppression in this case. A T_3 suppression test in which oral T_3 is administered and a repeat scan is done to look for decreased uptake in the nodule is one approach to see if suppression would work; however, it has a relatively low chance of success.

Radioactive iodine is not appropriate because the rest of the gland is not suppressed. Therefore, the radioactive iodine would damage the entire gland, and a strong likelihood of subsequent hypothyroidism would then exist. The only guaranteed option for relief of compressive symptoms is surgery.

Determination of hyperthyroidism is dependent on measurement of TSH, which, in this case, is not suppressed. Hot nodules possess an equal likelihood of progressing to hyperthyroidism, resolving on their own, or remaining unchanged. Watchful waiting is, in general, the best course of action.

Hot nodules are almost never malignant. In the rare exceptions, careful follow-up, not surgery, is indicated. Thyroid biopsy would not be helpful. All hot nodules contain follicular tissue, and a biopsy would be read as inconclusive, thus not helping the decision process.

To Our Readers

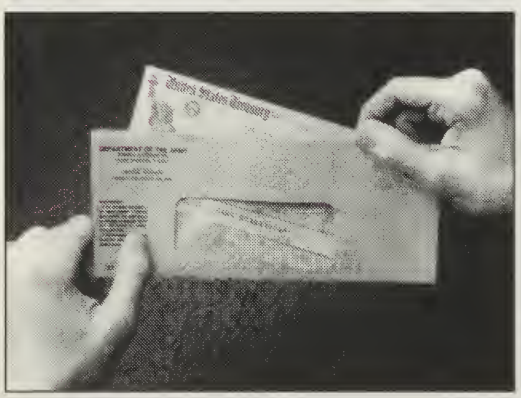
A new format for "A Clinical Moment with Diabetes" has been created. Content material will now include endocrinology and metabolism, as well as diabetes. Questions will be from physician to consultant. We hope this new format will allow for more useful information for physician readers. It will also provide a forum for responding to readers' questions. If you have a particular question, please forward it to the department editor: James Mersey, M.D., Suite 411, 6565 North Charles St., Baltimore, MD 21204.

A NEW OPEN MRI SERVICE AT DOCTORS GROOVER CHRISTIE + MERRITT

Now MRI is open to more patients than ever before.

Announcing Maryland's First Radiologist-Directed Open MRI Service.

Ideally suited for special needs patients.
Claustrophobics, the obese or those connected to life support systems are some of the patients who will be more comfortable with nonconfining and quiet Open MRI Service. But that's only one reason you'll be more comfortable referring patients to it.



Peer-to-Peer professional consultation.
GCM is the oldest continuing radiology practice in the nation. Our Open MRI Service is Maryland's first radiologist-directed facility using Toshiba's advanced Access LPT technology. So you can trust us to treat your patients with care, interpret test results accurately, and talk to you as one doctor to another.

A single source for every radiological need.
Please call today to learn more about GCM's Open MRI Service and other capabilities.

PHYSICIAN RESIDENT ALERT: IF YOU COULD USE OVER $25,000 A YEAR– ANSWER THIS AD.

The U.S. Army's Financial Assistance Program (FAP) is offering a subsidy of over $25,000 a year for training in certain medical specialities.

Here's how it breaks down - an annual grant, plus a monthly stipend and reimbursement of approved educational expenses.

You will be part of a unique health care team where you will find many opportunities to continue your medical education, work at state-of-the-art facilities, and receive outstanding benefits.

So, if you are a physician resident who could use over $25,000 a year, contact an Army Medical Counselor immediately.

Call Earnestine Beatty, 1-800-433-3573.

WORD ROUNDS

Bart Gershen, M.D.

"What's a Felty?"

In this month's *MMJ,* there is an article on **Felty's syndrome** (page 1113). The review was enlightening, but it had another, rather tangential, effect on me as I read it. I was constrained to ponder the eponym. (Greek *epi* 'upon' + *onyma* 'name'—any term that derives from a proper name.) For example, **Bright's disease** or **Hodgkin's disease**, respectively named for Richard Bright and Thomas Hodgkin, who were nineteenth century contemporaries at Guy's Hospital in London.

Eponyms—forgotten lives and faceless names—condemned to serve as insignificant and undistinguished common nouns. We repeatedly do this to our language. It is one of our most endearing eccentricities. But the idiosyncrasy is not confined to medical terminology.

Consider the case of the Frenchman who became a German engineer. He sought to develop an engine that could outperform the Watts' steam engine. In 1892, he patented the engine, then spent the rest of his life struggling to introduce it to the world. No one listened. In 1913, while crossing the English Channel, the inventor disappeared. He was never seen again. Only after his death did the world recognize that his engine embodied a pivotal advance in machine design. Unfortunately, Rudolph **Diesel** was unable to behold the triumph of his own genius.

There is also the tale of Queen Artemisia whose husband ruled Ionia around 400 BC. After her husband's death, she commissioned a magnificent burial chamber. It was built of marble with Ionic colonnades resting on a tall base surrounded by sculptured lions. At the summit, there was a large pyramid with 24 steps leading to a magnificent chariot. The structure became one of the seven wonders of ancient civilization. And, it became indelibly associated with its only resident—King **Mausolus**—resulting in the mysterious and haunting term: **mausoleum.**

Certain foods we eat convey mute testimony to their author. In 1829, a young Presbyterian minister maintained that Americans drank too much alcohol, ate too much meat, and used too much white flour in their bread. He championed a vegetable diet and homemade, unsifted wheat flour. Throughout the nation, "temperance" boarding houses were established. In fact, an entire commune was developed near Boston to foster the minister's nutritional convictions.

Ultimately, the furor faded, the minister languished into obscurity, and his dietary principles were forgotten—except for a cracker made from his special, coarse flour. The cleric's name was Sylvester **Graham.**

(Incidentally, the Presbyterian church derives its name from the Greek word *presbys* 'old'—as in presbycusis or presbycardia, which are diseases of old age. The church is governed by presbyters or elders.)

Melba toast is named for the Australian diva Helen Porter

Mitchell, who adopted the stage name **Nellie Melba** after Melbourne, her birthplace. (Peach ice cream covered with raspberry sauce is also named for her—peach **Melba**.) **Beef stroganoff**, named for a Russian diplomat, Count Paul **Stroganoff**, and **Chateaubriand steak**, named for François René, Vicomte de **Chateaubriand**, are also properly endowed—as are Roquefort, Cheddar, Edam, and Gorgonzola cheese, each of which bears the imprimatur of its place of origin.

Clothes, too, are often endowed with proper names. A coarsely woven cotton fabric was imported from the French city of Nimes for use in making overalls. It arrived bearing the seal "de Nimes"—and so became **denims**. Blue **jeans** come from the Italian port of **Genoa** where the cloth is manufactured. (In old French, Genoa was known as *Genes*, an American version of which became **jeans**).

Argyle socks, **Oxford** shoes, **cardigan** sweaters, **dungarees, Levi's®**, **derby** hats, **tuxedos**, and **mackintosh** raincoats—all carry names of persons or places.

Nevertheless, medicine remains the mother of all eponyms. **Felty's syndrome**, for instance, described by Augustus Roi **Felty** in 1924, is characterized by splenomegaly and pancytopenia in patients afflicted with rheumatoid arthritis.[1] Dr. Felty was a second-year medical resident at Johns Hopkins when he wrote that paper. Unfortunately, his academic career was all too brief. He was obliged to return to Hartford, Connecticut, to help his ailing father in his general practice. After 30 years in practice, Felty retired. In 1964, he died of a stroke, but his eponymic disease endures.

Most medical eponyms are readily identified as such. The aforementioned **Bright's** and **Hodgkin's** diseases represent classic examples—as do **Babinski's** sign, **Parkinson's** disease, **Huntington's** chorea, and **Raynaud's** syndrome. There are several medical eponyms, however, whose derivation from a proper name is not quite so obvious.

A Y-shaped anastomosis that includes the small intestine is called a **Roux-en-Y**. It is named for the Parisian surgeon who first described the procedure in 1908. His name was Jean Charles **Roux**.

Anatomic terms often bear the names of those who initially described them. Gabriele **Fallopio**, who characterized the oviducts that now bear his name, originally intended to enter the seminary. Fortunately for us, **Vesalius** persuaded him to undertake a medical career. In 1551, Fallopio succeeded the great Vesalius to become professor of surgery and anatomy at the University of Padua.

Fallopio's contemporary, Bartolomeo **Eustachio**, was also his chief rival. In 1562, Eustachio described the small tubes that connect the nasopharynx to the middle ear. He was also the first to describe the adrenal glands, and he produced a remarkable set of 47 anatomical drawings, which include a spectacular illustration of the sympathetic nervous system and of the valve guarding the entrance of the inferior vena cava into the right atrium—ultimately called the **Eustachian** valve.

One hundred years later, the auditory tubes were named for Eustachio by another obscure "eponymogenist," Antonio Maria **Valsalva**. The exercise in which expiration is forced against a closed glottis carries the **Valsalva** epithet.

In 1898, a cytoplasmic network of tubules and vesicles was discovered by Camillo **Golgi**, who was already known for his description of the chrome-silver nitrate stain for nerve tissue. The cellular organelle was understandably named the **Golgi** apparatus. In 1906, Golgi was awarded the Nobel Prize for medicine or physiology.

Other well-known anatomic features such as **pacinian** corpuscles, **meibomian** and **nabothian** cysts, and **Negri** bodies are also eponyms, named, respectively, for Filippo **Pacini**, Heinrich **Meibom**, Martin **Naboth**, and Adelchi **Negri**.

The **Luer** lock syringe was invented by Frederich **Luer**, a German fabricator of glass instruments. It is often used to start intravenous infusions of lactated **Ringer's** solution—named for the physiologist Sidney **Ringer**, professor of medicine at University College in London, who used it to preserve his isolated frog heart preparations.

The **Moro** reflex—the famous startle response—seen in normal children six months of age or younger, was described in 1910 by the Austrian pediatrician, Ernst **Moro**. He had previously isolated the *Lactobacillus acidophilus* bacterium, and was first to introduce intradermal skin tests for tuberculosis.

The **Queckenstedt** test, compression of the jugular vein to test for subarachnoid blockage, was developed in 1916 by a German physician, Hans Heinrich Georg **Queckenstedt**. He was killed by an army truck on the last day of World War I.

Petri dishes, **Somogyi** units, **Westergren** sedimentation rates, **Snellen** charts, **Wood's** light,

Rorschach tests, **Wheatstone's** bridges, **Trendelenburg** positions, **Kussmaul** breathing, and **Christmas** factor are all lasting monuments to the people for whom they were named. Perhaps, after this, they shall no longer be entirely faceless labels.

Erratum

Although listed in the Table of Contents, the name of the author of Word Rounds—Bart Gershen, M.D.—was inadvertently omitted from the column's title page in the October issue. The *MMJ* regrets the error.

4th Annual conference on Addiction

The problems of addiction and the need for treatment are ever-present in our society. Primary care physicians and other health care professionals must be able to screen, diagnose, and initiate treatment for their patients with addictive disorders. The 4th Annual Conference on Addiction is designed to educate all health care professionals in fulfilling these essential patient needs.

The conference has been designated for 8 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Speakers at the conference will be Max A. Schneider, M.D.; David Nurco, D.S.W.; The Honorable Harold E. Hughes; Lee P. Brown, Ph.D.; Father Joseph C. Martin, S.S.; and N. Joseph Gagliardi, M.D.

Registration fees for this conference include tuition, continental breakfast, refreshment breaks, lunch, and materials. Costs are $60 for Med Chi members, $100 for nonmember physicians and Ph.D.s, $40 for allied health professionals, and no charge for medical students and residents. To register and for further information on this exceptional conference, call the Physician Rehabilitation Program at 410-962-5580 or 1-800-992-7010.

Saturday, December 11, 1993
7:30 am - 6:00 pm

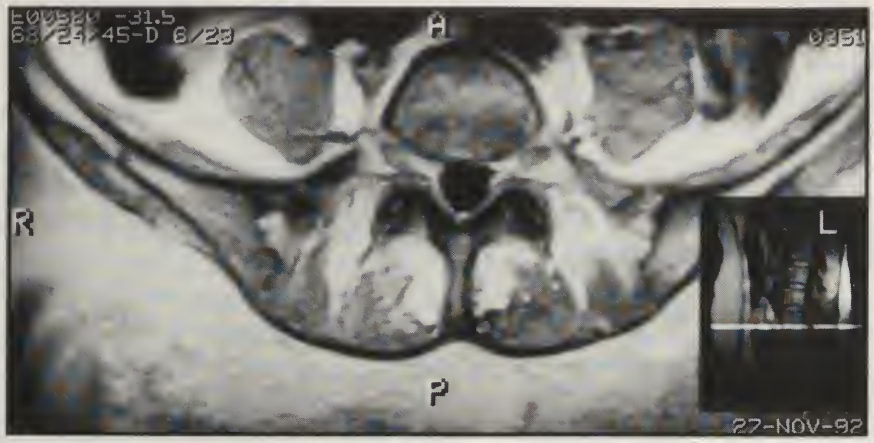
7032 Elm Road, BWI Airport
Baltimore, MD 21240



Two Reasons Why You Should Refer Your Patients To Accessible MRI:

1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.

We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

Book Reviews

Without Conscience. The Disturbing World of the Psychopaths Among Us.
Robert D. Hare. New York: Pocket Books. 1993. 142 pages. $21.00

Psychopaths have been part of our culture from time immemorial. One of the earliest, famed in story, was Bluebeard—the villain in a novel written by Charles Perrault in 1697. Bluebeard murdered six wives for their disobedience before the seventh had good fortune to escape.

Books, motion pictures, television, and newspaper articles currently tell the stories of serial killers, rapists, swindlers, abusers of spouses and children, drug barons, and terrorists. According to present psychiatric and legal standards, these individuals are not insane, and their activities are not the results of deranged minds but of a calculating rationality and an inability to think and treat others as human beings.

Their problems are not isolated since Hare states that two million psychopaths exist in North America, with at least 100,000 in New York City. A lifetime prevalence of an antisocial personality in the general population ranges from 2.1% to 3.3%, with the peak being in the 22–44 year-old age group. Among incarcerated felons, 52% of the males were psychopaths as were 65% of the females.

These unusual members of our society manipulate their way through life without feelings for the rights of other. Intrigued by their actions, Hare has analyzed them on the basis of his extensive personal experience in the Canadian penal system, as well as research and review of the literature.

The most obvious expressions of psychopathy are manifested by open violation of law and order. Many of these individuals are criminals. They are egocentric, callous, and remorseless. Deeply lacking in empathy, they function without the restraints of conscience. In some respects, psychopaths are similar to the emotionless androids depicted in modern science fiction.

Hare defines the psychopath in terms of emotional-interpersonal and social deviant symptoms. Glib, superficial, egocentric, and grandiose, Hare points out that these individuals lack feelings of remorse, guilt, and empathy. They are deceitful, manipulative, and shallow. In addition, they are impulsive, behave poorly, need excitement, and show a lack of responsibility. These factors combine to create distinct antisocial behavior problems starting in youth.

The appearance of psychopathy in the earlier years evokes the question "Why"? Hare states that some adolescents deviate from normal behaviors because of a poor social environment, but the psychopath seems to be off track from the start. The parents of psychopaths are usually aware that something is wrong even before school starts since the children grow with a stubborn immunity to moral and social pressures. These are the "different" children: liars, defiant ones, petty thieves, fighters, individuals cruel to animals, vandals, and early sexual experimenters.

Failure to recognize these fearsome personality changes may lead parents, the author states, to continuing conferences with school principals, counselors, psychologists, and psychiatrists. A succession of inappropriate treatments at considerable expense and emotional cost can follow.

Hare illustrates many psychopathic personality defects using accounts of real people as documented in the media. Who can forget "Son of Sam"?

The author points out that traditional psychotherapy has little to offer these individuals. External control of their behavior is a necessity, but even where parole, prisons, or hospitals exist,

psychotherapeutic relationships rarely change their behavior. Nothing seems to work, primarily because these people do not believe that they have reasons to conform to societal standards with which they do not agree. In many instances, treatment programs seem to provide them with better methods of manipulation, deceit, and use of people. The gathered evidence is depressing, engendering the concept that these people are untreatable and unmanageable.

Recognizing the urgent need for new ways to deal with criminal psychopaths and cognizant of the prevalent pessimism about traditional therapy, Hare is engaged in exploring new ways to aid these people. He has convened an international panel of experts in psychopathy, psychiatry, criminology, correctional treatment, and program design and evaluation. The main therapeutic thrust will be an attempt to convince the wrongdoers that their current attitudes and behaviors are not in their best interests.

Hare concludes his volume with some practical survival rules should one become involved with a psychopath. Professional advice should be sought early to make life easier and to enter the transitory stage from being a victim to protecting oneself.

This book is written for popular consumption and is not specifically directed to the medical profession. School counselors, psychologists, and, perhaps, some psychiatrists will acquire interesting and instructive information. The laity will gain an understanding of the bizarre personalities whom they may have encountered or have seen in the news media. Hare's further experience in the program he envisions should be instructive. The book should be on the shelves of public and medical libraries for widespread availability.

Well written, it has a good table of contents and an excellent bibliography, but suffers from lack of an index.

Laparoscopic Abdominal Surgery. John N. Graber, M.D., F.A.C.S.; Leonard S. Schultz, M.D., F.A.C.S.; Joseph J. Pietrafitta, M.D.; and David F. Hickok, M.D., F.A.C.S. (eds). New York: McGraw-Hill, Inc. 1993. 349 pages. $115.00

An eminent mathematician once remarked that he could never be satisfied with his knowledge of theory until he could explain it to the next man he met on the street. A convincing explanation, of course, necessitated that the unknown individual have some information about the subject.

In 1938, Spivack, a prominent surgeon, wrote that good surgical technique could be displayed if certain conditions were met. These included (1) gentle handling of the tissues; (2) a surgeon thoroughly familiar with every step of the operation; (3) a not unduly prolonged intervention duration; and (4) a well-exposed operative field with the individual tissues accessible should complications occur.

Graber and his associates have attempted to satisfy these concepts in discussing laparoscopic abdominal surgery. They present entirely new concepts for the performance of operations that have been done only during the last 10 years. The initial appeal to the patient, particularly with regard to cholecystectomy, was that the procedure could be performed through small entry portals, thus eliminating the large, right subcostal incision. This particular technique ushered in an era of minimally invasive surgery for any number of operations. Complications were minimal, and the first 300 patients returned to work without restriction within five to six days.

A surge of interest in laparoscopic surgery led to the writing of this text. The authors emphasize that although they have done their utmost to provide details about the conduct of these procedures, book study alone will not substitute for hands-on laboratory training, experience assisting surgeons qualified in the new techniques, and excellent supervision during initial clinical operations.

Graber et al contend that the future of surgery lies in "less invasiveness," although comparable procedures done in the usual manner have produced similar results. Shorter hospitalization periods and more surgery that can be done on an outpatient basis, however, are tangible assets of the new methods.

The performance of these highly technological operations will cost patients and insurance companies less, despite the increased expense from the use of electronic age equipment. In addition, the price of the hospital stay will be reduced.

Resolution of the training problem is difficult. Surgical residents may acquire some necessary skills during their periods of preparation, but until these new operations become routine, residents and established surgeons must take additional courses in the new type of surgery. One fact that cannot be escaped is that individuals performing minimal invasive surgery must be thoroughly grounded in the conventional open procedures. They must know the anatomy of the abdomen and should have performed the procedure in the traditional or "old" way. An occasion could arise in which a surgeon might be forced to abandon the new operation methods and proceed with an orthodox laparotomy.

The first portion of the book is devoted to the instruments used. Laparoscope,

lasers, cautery, and operating needs are meticulously presented. Details of irrigation, suction, suturing, and knot tying are well described.

A coordinated operating team is mandatory if good results are to be obtained. The group should include a surgeon, an operating assistant, an anesthesiologist, one to two scrub nurses, a television specialist, and, possibly, a laser expert.

Succeeding chapters, are devoted to anesthesia, general laparoscopy complications, appendectomy, cholecystectomy, cholangiography, common duct exploration, peptic ulcer surgery, gastroesophageal reflux treatment, inguinal herniorrhaphy, and resection of the large and small intestine. All operations are well described and depicted by excellent illustrations, some of which are in color.

Even a well-trained surgeon cannot perform laparoscopic surgery after careful study of this book. However, when used in conjunction with laboratory exercises, and assistance to, and then direct supervision by, a qualified specialist, the future laparoscopic surgeon will find the text tremendously helpful. This book was not written for medical students or general practitioners. As Gray is to anatomy, so Graber et al are to trained surgeons in this new flourishing sphere of activity.

THE LEADER IN HAIR REPLACEMENT FOR OVER 25 YEARS

Forty years ago

Forty years is a fascinating interval. It can be seen as a generation—four decades of change and advancement: new medications, new diagnostic tools, and new techniques and procedures.

On the other hand, human nature may not have changed very much. *Plus ça change, plus c'est la même chose.*

Excerpts from the past are selected to remind us of our limitations. Some limitations of the past may seem silly in today's scientific light, but others may point out the ignorance of today and the need to mush on with some humility.

1953:

Saul Bellow published "The Adventures of Augie March." Ben Hogan won the US Open, Masters, and British Open. The Soviet Union exploded an H-bomb.

Below is a monthly report from the Blues and a cautious pitch to Med Chi's House of Delegates. With such an arrangement, everyone seemed a winner. Does it seem too good to be true?

JOHN W. BUCKLEY, M.D.

Report for the Board of Trustees of Maryland Medical Service, Inc.

Reprinted from the *Maryland State Medical Journal* 1953; 2(7): 391–92.

Maryland's Blue Shield plan has come a long way in its two brief years of existence. It now serves 197,000 Marylanders, 37,000 more than at the end of 1951. Our enrollment gain for 1952 under the standard program was 50 %, and nearly half of this gain came after September 1, when changes in the fee schedule and subscription rates materially improved the attractiveness of the plan. The plan's income in 1952 went over the million dollar mark, and, of this amount, 83.6% was paid in benefits to subscribers. Compared with the early record of Blue Cross—a remarkable story of progress in itself—our growth has been steady and healthy, and a certain amount of optimism seems justified.

Despite its successful progress, Blue Shield still has far to go to meet its basic obligation—an adequate and effective means of financing physicians' services for as many persons in the community as possible, at a price they can afford to pay.

Let us analyze this objective. Is the protection adequate? It seems as nearly so as we can make it right now, although in time we will probably wish to broaden it. Last year we paid benefits to about 1 in every 10 persons enrolled. Of these cases, under our own plan (excluding the special surgical program for Bethlehem Steel employees), 60% of the cases involved surgery, 31% were medical, and the remaining 9%, obstetrical. These figures show the importance of our medical coverage, which is not always available elsewhere under Blue Shield or commercial insurance programs.

Is the price one the great majority can afford to pay? Apparently it is, judging from our own experience and that of Blue Shield plans in other areas. Whether it could be increased in order to broaden benefits is a question that must some day be studied.

But what of our objective to make Blue Shield available to as many persons as possible? Here we have only scratched the surface of our potential market. We have enrolled only 22% of the Blue Cross membership. A tremendous selling job remains to be done, and this is not easy, since we find that in the majority of large groups we have to replace an existing commercial coverage taken out in the years before Blue Shield was in existence.

One of the most important features of Blue Shield—one that could and should be the most important—is the service benefit feature whereunder participating physicians agree to make no additional charge for covered services to individuals and families with annual incomes less than the pre-established amounts. This is the one factor that distinguishes Blue Shield from commercial health insurance.

To persons in the lower income brackets, this service benefit feature means full protection against unexpected medical bills. They get the best medical care and are able to budget for it in advance through membership in Blue Shield.

In agreeing to provide services at pre-determined fees to persons in the lower income brackets, the physician is not deviating from the established practice of charging patients according to their ability to pay. At the same time, he is providing real service to the community.

The phenomenal growth of Blue Shield—24 million members nationally—has been one of the chief factors (along with the growth of Blue Cross) in persuading the proponents of federal compulsory health insurance that the provision and financing of medical care for the self-supporting population can be achieved on a voluntary basis.

Blue Shield is our creation. It is controlled here and elsewhere by the medical profession. We collect the money and undertake to provide the services of qualified physicians, which is right and proper since our interest is paramount. But with our control goes responsibility, and with responsibility goes opportunity. If any other agency, in or out of government, undertook to provide the public with professional services, we would lose control of medical practice.

The continued success of Blue Shield will depend entirely upon the degree of our voluntary cooperation and participation. Hence, we must endorse Blue Shield to our patients and friends. By so doing, we will bring the program closer to its objective—an adequate and effective means of financing medical care for as many persons as possible at a price they can afford to pay—and we will have rendered a real service to our patients, to the community, and to ourselves.

HUGH J. JEWETT, M.D.

Dr. Jewett, who was on the *Maryland State Medical Journal* editorial board from 1952 to 1960, read this paper before the Med Chi House of Delegates on April 27, 1953. ■

Highlights: Executive Committee and Council Actions

Executive Committee meeting, August 26, 1993

- Med Chi will support legislation applying a cap on noneconomic damages to wrongful death actions.

- Three recommendations from the Committee on Public Health were approved and will be submitted to Council: (1) that Med Chi support the list provided by the Maryland Association of County Health Officers (MACHO) as a reasonable list of services to be provided by local health departments; (2) that Med Chi continue its participation in the Coalition for a Smoke-Free Maryland but not be the agent responsible for organizing and staffing the coalition; and (3) that Med Chi support the coalition's six principles.

- A press conference will be held on September 8 to announce the family violence initiative to be sponsored by Med Chi. The Committee on Public Health and the Public Relations Committee will continue promoting this initiative.

- The Executive Committee approved the Public Relations Committee's recommendation to enhance Med Chi's internal communications program as outlined, but tabled the second part of the recommendation to hire a firm to develop and coordinate a public relations campaign to enhance the image of Maryland physicians.

- The Executive Committee approved the Public Relations Committee's recommendation that although Med Chi has no control over individual physicians choosing to advertise, component societies should be requested to refrain from providing endorsements when individual physicians are promoted.

- The Committee on Specialty Societies requested that the Executive Committee explore ways to enhance communication about Med Chi activities with the various specialty groups. In response to this request, Dr. Snyder, Med Chi president, will write to the specialty societies suggesting that they seek out specialty society members in leadership roles at Med Chi and contact these members if they have a particular interest. Med Chi staff will explore the cost and personnel demands to provide newspaper clippings to specialty societies.

- The Committee on Physician Rehabilitation recommended a three-part policy statement on physician use of alcohol in relation to patient care. After discussion, the Executive Committee adopted the following policy statement: *The Faculty finds that it is totally unacceptable for a physician to drink alcohol in proximity to examining and treating a patient in any setting. The relationship between patient and physician is harmed by the patient being aware that the physician has recently used alcohol, as noted by: an odor of alcohol; slurred speech; lack of motor coordination; or cognitive impairment. The use of alcohol in such situations is likely to lead to a reduction in quality of care and raises the likelihood of harm to the patient. It is therefore recommended that a physician on duty, on call, or planning to evaluate or treat a patient, will not drink alcohol.*
  The committee's recommendations concerning a policy statement on physician use of alcohol in relation to patient care will be forwarded to Council for approval, with the Executive Committee's recommendations noted.

- The Committee on Drugs requested guidance on the proper handling of requests for amphetamine and methamphetamine permits that fall outside of current regulations and how to ensure that the committee's procedures for granting permits are in compliance with state regulations. The committee and Med Chi general counsel were directed to work together to revoke the regulation mandating that Med Chi issue permits to physicians for the use of amphetamines and methamphetamine.

- Following a brief Legislative Committee report, the Executive Committee passed a motion to send a letter to the House of Delegates, along with the amendments submitted by the county medical societies, explaining why it was not feasible to present all the amendments to the legislature and was more appropriate to have the lobbyist and general counsel work through the Health Care Access and Cost Commission to improve HB 1359.

- The Finance Committee was instructed to look into whether Executive Committee members should be re-

imbursed for expenses and, if so, the criteria for determining reimbursement.

- The Executive Committee approved a Med Chi member survey regarding managed care, with results being forwarded to the Executive Committee.

- Rose Matricciani, R.N., J.D., chief operating officer, updated the Executive Committee on the x-ray aide test results. Of the 112 individuals who took the x-ray aide course, 42 passed the test with a grade of 75% or better. Some individuals who took the course were not employed in physicians' offices. A retest will be given in September; it will be given free of charge to students who did not pass the test previously.

- Angelo Troisi, F.A.C.H.E., chief executive officer, will send self-referral research teams at the University of Baltimore and the University of Maryland packets of studies relative to the self-referral issue.

- The Committee on Public Relations will study the issue of Executive Committee members' attendance at various fund-raisers and events in order to improve the public's perception of physicians.

- Dr. Snyder noted that the AMA will administer the Robert Wood Johnson Grant Program to help states fight tobacco use.

- The Executive Committee approved the request from the Committee on Computers in Medicine that a questionnaire on computer use in medical offices be published in the *MMJ*.

- The Executive Committee met in executive session for approximately two hours to review the audit report.

- The recommendation of the Finance Committee that there be no dues increase was tabled. The Finance Committee's recommendation that a fiscal note be attached to every committee recommendation was approved. Both recommendations will be reported to Council with the actions of the Executive Committee.

- Because of the interest in becoming Med Chi members expressed by physicians in academia, Dr. Snyder appointed an Executive Committee subcommittee to investigate and recommend membership classes and a dues structure for physicians in academia; and determine how Med Chi could meet the needs of these physicians.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872
1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration opportunities in Maryland.

MMJ announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.

Minutes of the 341st session of the House of Delegates

Special meeting, Thursday, July 15, 1993

Call to order

The 341st session of the House of Delegates was called to order by the president and chairperson, Joseph Snyder, M.D., at 4:05 p.m. This was a special meeting called by the president to discuss HB 1359.

Invocation

Donald "Ted" Lewers, M.D., a Med Chi member and a guest at today's meeting, delivered the invocation.

Announcements

The chairperson drew the delegates' attention to the announcements contained in the agenda and reminded members that when they had the privilege of the floor, they were to announce their name and component medical society.

President's remarks

Dr. Snyder introduced George S. Malouf Sr., M.D., chairperson of the AMA delegation, who noted that a report of the AMA annual meeting recently held in Chicago was included in the packet mailed to members. Dr. Malouf then introduced the newest member of the AMA Board of Trustees, Donald "Ted" Lewers, M.D., noting that Dr. Lewers is "one of our own." Dr. Lewers has been a Med Chi member for over 25 years and an active participant in AMA affairs. The House of Delegates extended its congratulations to Dr. Lewers.

Dr. Lewers thanked Drs. Henry Wagner and George Malouf for their hard work in helping him run for the AMA Board of Trustees. He also thanked Angelo J. Troisi, F.A.C.H.E., chief executive officer; Rose Matricciani, R.N., J.D., chief operating officer (COO); Carmine Valente, Ph.D., deputy executive director; Vivian Smith, director of public relations; and Arlene H. Whalen, administrative assistant to COO, for their contribution to his success during his campaign.

Dr. Lewers said it was important that members work together. He emphasized that physicians must be unified more than ever before because of health system reform, and offered whatever help he could give.

Dr. Snyder noted that Alex Azar, M.D. had been selected to serve as a member of the Health Care Access and Cost Commission (HCACC), which was established under the provisions of HB 1359. Dr. Azar was congratulated by the House of Delegates on his appointment.

Dr. Azar remarked that even though he is a Med Chi appointee and member, as a commissioner, he must vote for what is best for the citizens of Maryland, and what is best for all patients and for all physicians.

Dr. Snyder introduced David Doman, M.D., a member of the House of Delegates, who is running for a congressional seat in the eighth district. Dr. Doman asked the members for their support. He noted that he was an advocate for the patient and welcomed members' advice.

Health system reform

A representative from the AMA Department of State Legislation, Kelly C. Kenny, provided an overview of health system reform. Discussion centered on health system reform in other states. It was noted that the states will have to see what direction to take after the federal government comes out with its health system reform plan. She noted that a single, central health care authority or board inevitably appears in most major state health system reform proposals. Eight states have packaged computerized programs, and 40 states have passed some type of health system reform.

Amendments to HB 1359 "Health Care and Insurance Reform"

The president informed the House that 23 amendments were submitted by the May 21 deadline. During the past two and one-half months, the Executive Committee worked extremely diligently for approximately 25 hours during four meetings reviewing HB 1359 amendments. Dr. Snyder introduced Hilary O'Herlihy, M.D., chairperson of the Legislative Committee, and Angus Everton, Esq., Med Chi general counsel, who reviewed all submitted amendments.

Mr. Everton noted that an errata sheet had been added regarding amendments 2 and 9 and thanked Bernadette Lane, executive director, Baltimore City Medical Society (BCMS), for bringing the information to his attention. Mr. Everton also noted that voting would be by

consent calendar and that the Executive Committee recommendations on amendments 1–23 (minus 14) were included in the revised agenda. After the amendments were presented, the House moved to extract the following amendments: 2, 4, 7, 9, 11, 12, 20, and 23. The other amendments (1, 3, 5, 6, 8, 10, 13, 15–19, and 21) were approved to be submitted as recommended by the Executive Committee; Amendment 23 was approved not to be submitted as recommended by the Executive Committee.

Amendment 2 §19-1507(H)(1). A motion was made to support the primary #2 amendment, not the two alternate amendments presented. This was seconded and approved.

Amendment 4 §19-1509. It was noted that the payment system needed to be brought back in line with the legislative purpose to enable the HCACC to put a handle on outlyers. The amendment and the alternate amendment were explained. Persons of the same specialty group must be compared. It did not allow comparison across specialty groups, and this amendment would do so. It was noted that if someone wanted to amend the bill further to define specialty group to be no more than people within a certain practice—doctors as opposed to podiatrists—that would be acceptable. A question was posed regarding performance comparison in terms of specialty. An amendment was made and approved to include that a specialty group should be people within a certain practice. The amendment to the amendment was carried. The amended amendment was carried.

Amendment 7 §3-2A-02(c). It was noted that in the original HB 1359, the Maryland General Assembly included a "community standard of care" in return for removing the provisions in the practice parameter section that would have made them affirmative defenses in malpractice suits. People who testify in such cases would only be able to testify as to the standard of care prevailing in the community.

The suggested amendment was formulated to require that the expert actually reside in a community similar to that at issue in the case at which he or she may be testifying. It was noted that the definition of "community" was a problem because a physician in one specialty or section of a town might have a different standard than another physician in another area or practicing in another specialty. Therefore, it was thought that the fairest way to define community would be as "...an economically, demographically, and geographically separately identifiable population group." It was noted that Medical Mutual Liability Insurance Society of Maryland, Inc. (Med Mutual) is not in favor of having this type of amendment added to HB 1359. After some discussion, a motion was made to table this amendment until Med Chi could meet with Med Mutual and learn why it does not wish an amendment to be made. The motion passed 63 to 41 to table the amendment.

Amendment 9 §19-1507(a) and (b), §19-1515(a)(1). This amendment was designed to ensure that HCACC does not selectively pick the health care professions it wishes to regulate. As the bill is designed, however, HCACC could conceivably decide to regulate only a handful of professions, including or excluding physicians. Med Chi thought that everyone should be regulated.

The Baltimore County Medical Association (BCMA) presented two amendments. Because the bill uses the term "and office facilities" many places in the law, it was suggested to leave this in the present bill and move the bracket in Amendment 9 to "selected..." and on page 22, lines 20 to 42 of HB 1359, where it talks about variation in fees charged by physicians in offices, BCMA suggested that the word "physicians" be changed to "health care practitioners" for consistency.

Mr. Everton agreed that these two amendments were good amendments. He also thought that "health care practitioners" should be changed everywhere in the bill and hoped the House would agree. The House of Delegates approved the amendments to Amendment 9 submitted by BCMA.

Baltimore City Medical Society (BCMS) submitted an amendment to change the wording under paragraph (b)(1) "collect from **every health care practitioner** for each type of patient encounter **designated by the commission**." Mr. Everton noted that by putting the words, "designated by the commission" back in, it gave the HCACC the option of leaving some practitioners out. The House defeated the amendment. The amended Amendment 9 was approved by the House of Delegates.

Amendment 11 §19-1507(k), §19-1509(d)(4). Dr. Blumberg noted that he asked Amendment 11 to be extracted only to note a typographical error—line four should read "entire surgery and service." The House approved the amendment as amended.

Amendment 12 §19-1509(c)(2)(iii). It was noted that BCMA extracted this amendment because it thought it was difficult to define the word "reasonable" when referring to "the reasonable cost of bad debt and charity care...." BCMA thought that the word "reasonable" should be deleted. Mr. Everton did not think that deleting the word "reasonable" would cause a problem

and thought it was a good idea. The House of Delegates approved the amendment to Amendment 12 and approved the amended amendment.

Amendment 20 §19-1511(u)(6). BCMA was concerned about the collection of information. BCMA suggested that the words "published or disclosed" be changed to "published summary." The amendment was approved by the House of Delegates. The amended amendment was passed by the House.

Amendment 23 §702 (8)(1). Mr. Everton noted that the Executive Committee had recommended that this amendment not be approved for submission. Mr. Everton noted that there was a community rating provision in the health benefit plan, and BCMS has suggested that two parts of it be deleted. One part stated that there shall be community rating, except it may consider age and may consider location—one of four geographic groups around the state. It was noted that insurance would cost more for some people in some jurisdictions if the people were lumped into a statewide community rating or an age rating.

BCMS moved that in Section 702, paragraph 8(1), page 45 of the bill, the adjustment for age be eliminated. It was noted that new firms with new employees, who would probably be young, would have an edge over older firms with older employees, and this could increase the probability that older employees would lose their jobs because these employees could be costing a firm more.

Mr. Everton noted that by taking age out, Section 702 of the insurance code, which deals with community ratings, would read as follows: "A carrier may only adjust the community rate for geography based on the following contingent areas of the state: Baltimore Metropolitan, DC Metropolitan, Western Maryland, Eastern and Southern Maryland.... Rates for health benefit plans may vary based on family composition as approved by the commission..... Based on the adjustment allowed under subsection a(2) of this section a carrier may charge a rate that is 50% above or below the community rate...between July 1, 1994, and June 30, 1995; 40% above or below the community rate...between July 1, 1995, and June 30, 1996; 33% above or below the community rate...between 1996 and 1997; 16% above or below for plans delivered or renewed after July 1, 1997." Mr. Everton noted that the ultimate community rate allows a 16% floater. "On or before 1998, the commission shall submit a report to the governor. The report will be on the feasibility and desirability of establishing a pure community rate or obtaining an adjusted community rate." It was noted that Med Chi should try to have this part of the amendment changed to serve the older population.

Mr. Everton noted that it was not a good idea to entirely eliminate age because by doing that the rates for young families who were in need of insurance could be raised. The main people who cannot afford health care are younger consumers. If the ability of the carriers to differentiate on the basis of age is eliminated, it may hurt younger consumers rather than help them.

It was noted that this was an insurance charge issue, and not a medical issue, and that Med Chi should stay out of this realm. The AMA representative noted that the AMA refers to community adjustment but does not discuss the age issue.

The amendment from BCMS was adopted to delete age from the criteria of held insurance. An amendment to also delete geography was presented by BCMS. It was questioned how geography could be deleted and still retain a community rating system. It was noted that in many rural areas, physicians charge less than physicians in metropolitan areas because people in the rural areas normally are making less money. It was thought that the entire bill was contingent on community ratings.

It was noted that an affirmative vote would mean the bill was accepted as amended, and a negative vote would mean that it was not. A vote was taken on the amended amendment. The amended amendment was approved only as to eliminating age. It was requested that all the amendments as amended should be sent to the components when finalized.

❑ *Amendments not reviewed by Executive Committee*

The BCMA was concerned that amendments it had submitted were not being reviewed at this time. It was noted that BCMA submitted its amendments a month late for consideration for presentation at this meeting, and the Executive Committee had agreed that these amendments needed to be looked at more closely by general counsel and the Executive Committee in the same manner as all other amendments. Therefore, at both the June 24 and July 12 meetings, the Executive Committee did not think these amendments should be submitted to the House of Delegates for approval at this time.

Mr. Everton noted that many of the amendments were good amendments, but he needed time to review them. A question of time was brought up. It was the consensus of the House that amendments could be submitted up

until the Maryland General Assembly meets on HB 1359. Therefore, since BCMA did not submit its amendments on time for them to be reviewed and forwarded to the Executive Committee for consideration, the House of Delegates thought that the amendments could be reviewed by the Executive Committee at its next meeting.

❑ *Reference Committee report*

Murray Kalish, M.D., Reference Committee chairperson, gave the committee report. He noted the committee met on June 30, 1993, to discuss the two resolutions submitted by BCMA. The Reference Committee recommended that the first resolution be adopted, which read

Resolved, That the president of Med Chi appoint an ad hoc committee to study the feasibility, desirability, and advisability of a physician all-payer system and development of appropriate legislation, if recommended.

The House of Delegates concurred with the Reference Committee's recommendation. The chairperson then presented the second resolution from BCMA, which read

Resolved, That this House of Delegates directs the officers, Legislative Committee, and staff of the Medical and Chirurgical Faculty to work for the amendment or repeal of any section of current Maryland law that may establish a cap on fees, establish a fee schedule, or prohibit balance billing for any physician in Maryland without the express consent of the individual physician.

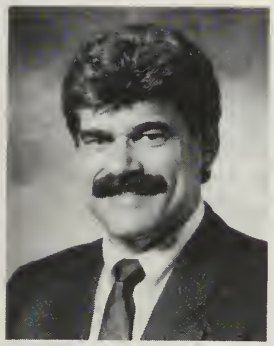
The Reference Committee recommended that the second resolution not be adopted. It was the committee's consensus that the wording of the resolution, which required opposition to legislation and regulations, would tie the hands of the officers, staff, and Legislative Committee in their legislative negotiations. Furthermore, the Reference Committee questioned the phrase "without the express consent of the individual physician" because it was impossible to canvass each individual physician in Maryland to determine his/her express consent in order to amend, repeal, or oppose legislation or regulations. In order not to limit Med Chi in its negotiations, and to preserve physicians' rights, the Reference Committee recommended that the word "oppose" in the resolution's first resolve be changed to "modify," and that the phrase "without the express consent of the individual physician," which appears in both resolves, be changed to "thereby preserving the physician's right to establish his/her own fees." The wording suggested by the Reference Committee was rejected by BCMA.

The House of Delegates voted to table the resolution by a majority.

❑ *Other business*

A question as to whether it was AMA policy to favor fee scheduling was asked. Paul A. Markowski, AMA, noted that Report UU, presented by the AMA Board of Trustees at the 1993 AMA annual meeting, was extremely watered down when it was presented to the AMA House of Delegates. This report will be presented again at the next AMA meeting. Dr. Lewers noted that the AMA's position was that it endorsed the concept of resource-based relative valve scales (RBRVS). Dr. Lewers thought this could be interpreted as an endorsement of a fee schedule. Dr. Lewers noted that RBRVS was moving through the private sector at a rapid rate, and most carriers are exploring its utilization and are implementing it in many areas. Dr. Lewers said that Report UU did not endorse a Medicare RBRVS, but that the private sector would work on RBRVS for the private sector.

Ad Hoc Committee on Legislative Enhancement



Dr. Snyder noted that he had appointed an Ad Hoc Committee on Legislative Enhancement, whose charge was to look at the legislative agenda, the lobbying issue, and where Med Chi was headed for next year. The chairperson is Jose M. Yosuico, M.D. This committee has met on three different occasions and has a done a tremendous job. The committee will present a report to Council. This committee has diligently studied the lobbying needs of Med Chi and has interviewed eight candidates for a position in "Government Relations." All individuals are highly qualified and were culled from a list of 26 individuals who sent their résumés. Because of confidentiality, names of individuals interviewed can not be revealed at this time. On June 12, the Executive Committee authorized the chief executive officer to meet and negotiate with the top two or three candidates and prepare a report for the Executive Committee as soon as possible. A question as to whether the person hired as a lobbyist would be hired full-time in-house was raised. Dr. Snyder said that the person chosen should be the best person possible, regardless of whether he or she were in-house or otherwise.

❑ *Adjournment*

There being no further business, the meeting was adjourned at 6:45 p.m.

Respectfully submitted,
Paul A. Stagg, M.D.
Secretary

Members in the News

J. LEONARD LICHTENFELD, M.D., a practicing internist in Baltimore, was elected to serve a one-year term as secretary-treasurer of the American Society of Internal Medicine (ASIM); ASIM represents more than 26,000 internists nationwide. First elected to the ASIM Board of Trustees in 1990, Dr. Lichtenfeld also serves on the society's Quality Assurance and Utilization Review Committee. A past president of the Maryland Society of Internal Medicine (MSIM), he was named the MSIM "Internist of the Year" in 1987. Dr. Lichtenfeld earned his bachelor's degree at the University of Pennsylvania and his medical degree from Hahnemann Medical College in Philadelphia. Certified by the American Board of Internal Medicine, he is on the staffs of Sinai Hospital, Johns Hopkins Hospital, and Northwest Medical Center. Dr. Lichtenfeld is an instructor at the Johns Hopkins University School of Medicine and fellow of the American College of Physicians. Long active in health policy, he currently serves on a physician panel developing mammography guidelines for the Agency for Health Care Policy Research. A member of the health advisory committee to Congressperson Ben Cardin, Dr. Lichtenfeld recently served as a physician reviewer for the President's Task Force on Health Care Reform. In 1992, he participated on a Health Care Financing Administration panel reviewing the codes used to determine Medicare's physician fee schedule.

THEODORE C. PATTERSON, M.D., was recently selected as a finalist in the 1994 American Academy of Family Physicians Family Doctor of the Year competition—one of only 10 physicians and the only one from Maryland receiving this honor. Awards criteria stipulate that the physician provide his or her community with compassionate,comprehensive, and caring medical service on a continuing basis, and that the physician be directly involved in community affairs and activities that enhance the quality of life in the physician's home area. Nominees must also serve as role models. Past president of the Baltimore County Medical Association (BCMA), Dr. Patterson is a graduate of Morgan State University, Howard University, and the University of Maryland School of Medicine. In 1992, he received the BCMA's Community Service Award; in 1990, he was named Dundalk's Citizen of the Year by the Optimist Club; and in 1969, he received the Dundalk Jaycees Distinguished Service Award.

DANIEL J. WINN, M.D., has been named medical director of CFS Health Group, Inc. effective September 1993. CFS Health Group owns and operates four Blue Cross and Blue Shield of Maryland health maintenance organizations (HMOs): CareFirst, FreeState, Potomac Health, and Delmarva Health Plan. A graduate of the University of Delaware, Dr. Winn received his medical degree from the University of Maryland. A board-certified specialist in internal medicine, Dr. Winn is a member of the Baltimore County Medical Association, the American College of Physician Executives, the American College of Physicians, and the Southern Medical Association. He is also a diplomate of the American Board of Internal Medicine. Prior to joining CFS Health Group, where he will oversee the areas of quality improvement, medical policy, utilization management, and credentialing, Dr. Winn served as medical director of Potomac Physicians, P.A. for five years and was medical director for Health America/ Maxicare—a national HMO.

DEC. 31 DEADLINE

SELF-EMPLOYED?
DISCOVER THE *SIMPLIFIED* KEOGH

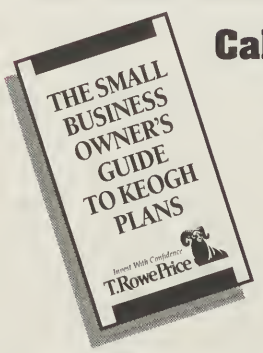
THE T. ROWE PRICE SIMPLIFIED KEOGH℠ OFFERS A STREAMLINED APPROACH TO RETIREMENT SAVINGS

Until now, small business owners and self-employed individuals looking for a Keogh often found plan setup and administration a hassle. Now, the T. Rowe Price Simplified Keogh makes this easier.

Maximum tax advantages with minimal effort.

The Simplified Keogh still lets you contribute pretax income of up to $30,000 that grows tax-deferred until withdrawal. But with our ready-to-adopt Keogh Profit Sharing Plan and Keogh Money Purchase Pension Plan, there is no lengthy application to complete. And you'll find running these plans simpler than most other Keoghs.

Flexibility now and in the future.



To set up your Keogh, you can choose from 33 of our no-load mutual funds. Whether your investment style is conservative or aggressive, whether you're planning to retire in 5 years or 25 years, you'll find investments to meet your retirement goals. And, as those goals change, you can adjust your investments with just a phone call.

The experience of retirement plan experts.

T. Rowe Price pioneered retirement plan administration for the mutual fund industry and continues to be a leader today. This expertise stands behind our Keogh plans. As a shareholder, you'll have toll-free access to our retirement specialists, who are available to answer investment *and* plan questions.

Call for more information and our free guide.

To take advantage of Keogh tax benefits for the 1993 tax year, you must set up your plan no later than December 31, 1993. To help you decide which Keogh is right for you, call for our free guide, *The Small Business Owner's Guide To Keogh Plans*. This informative publication will help you better understand Keogh plans and how they may meet your retirement goals.

In Memoriam

Nathan Block, M.D.

NATHAN BLOCK, M.D., an obstetrician from Pikesville, died October 3, 1993, of amyotrophic lateral sclerosis (Lou Gehrig's disease) at Northwest Medical Center. Dr. Block, a native of New York, earned his medical degree from the Long Island University College of Medicine in 1938. He was an intern in radiology and obstetrics at Beth Israel Hospital in Boston, completed a residency in surgery at Mount Sinai Hospital in New York, and moved to Baltimore in 1940 as a resident in obstetrics at Sinai Hospital. Dr. Block was an army medical officer at Letterman General Hospital in San Francisco during Word War II. A member of the Baltimore City Medical Society, the American Medical Association, the Southern Medical Association, and the American College of Obstetrics and Gynecology, Dr. Block had also been on the medical staffs at Sinai and St. Joseph hospitals and Franklin Square Medical Center. He retired in 1988 from a practice he began in 1943 in the Dundalk, Middle River, and Rosedale areas. Dr. Block was 78.

Arthur B. Cecil, Jr., M.D.

ARTHUR B. CECIL, JR., M.D., a general and thoracic surgeon from the Eastern Shore, died May 10, 1993, in Easton, Maryland. An emeritus member of Med Chi, Dr. Cecil was member of the Talbot County Medical Society. A resident in surgery in 1943 at the Johns Hopkins Medical Institutions, he was on the faculty in the Department of Medicine in 1960. Dr. Cecil was 51.

Nassar Javadpour, M.D.

NASSAR JAVADPOUR, M.D., an internationally known authority in urological oncology, died October 26, 1993, at Johns Hopkins Hospital from complications following cancer surgery. Born in Iran, Dr. Javadpour received his medical degree from the American Medical School in Iran in 1962. Following a surgical internship and residency at Chicago Medical College and a urological residency at the University of Minnesota Medical Center, he served as a staff urologist at the University of Chicago Hospital. Dr. Javadpour was an American Urological Association research scholar and visiting scientist at the Armed Forces Institute of Pathology before assuming the post of chief of urology at the National Cancer Institute. From 1985 to 1991, he was a professor of medicine at the University of Maryland Medical School, when he left to head the urology department at Maryland General Hospital. Dr. Javadpour had also served at Harbor Hospital Center. Active on editorial boards of six medical publications, Dr. Javadpour developed a substitute bladder for cancer patients and discovered the biological marker for testicular seminoma. Author of 12 books on urologic oncology, he had also filmed and edited 8 movies on testicular cancer. A member of 20 medical societies including the Baltimore City Medical Society, Dr. Javadpour was 56.

Bernard Kleiman, M.D.

BERNARD KLEIMAN, M.D., who was a pioneer in Baltimore in the use of a surgical procedure to replace the stirrup bone, died October 26, 1993, at his Pikesville home from amyotrophic lateral sclerosis (Lou Gehrig's disease). Born in Baltimore, Dr. Kleiman was a graduate of the Johns Hopkins University and the University of Maryland medical school. He completed an internship at St. Joseph Hospital and residencies at Washington University Hospital in St. Louis and Queens General Hospital in New York City. After serving in the Army Medical Corps, Dr. Kleiman began practicing at St. Joseph Hospital, where he was chief of the ear, nose, and throat department from 1950 to 1985, and president of the medical staff from 1979 until 1981. A licensed pilot, Dr. Kleiman was president of the Baltimore County Medical Association in 1987. He retired from practice in 1992. Dr. Kleiman was 79.

Ralph Stiller, M.D.

RALPH STILLER, M.D., a retired pediatrician from Silver Spring, died October 2, 1993, at Holy Cross Hospital of an aortic aneurysm. Born in New York, Dr. Stiller received his bachelor's and medical degrees from New York University. During World War II, he served in the Army Medical Corps in North Africa, Italy and France. He moved to the Maryland area to become a resident at Children's Hospital in the late 1940s. He subsequently joined the staff of Group Health Association and became head of its pediatrics department. Dr. Stiller maintained a private pediatric practice in Silver Spring from 1954 until his retirement in 1986. He had been a member of the medical staffs of Holy Cross Hospital, Children's Hospital, and Washington Adventist Hospital. A fellow of the American Academy of Pediatrics, Dr. Stiller was also a member of the Montgomery County Medical Society, the Montgomery

County Pediatric Society, and the American Medical Association. Dr. Stiller was 77.

Millard T. Traband, Jr., M.D.

MILLARD T. TRABAND, JR., M.D., who practiced medicine in West Baltimore and Baltimore County for 36 years, died October 10, 1993, at a hospital in Gloucester, Virginia, of complications from a broken hip. Born in Baltimore, Dr. Traband was a graduate of the pharmacy and medical schools of the University of Maryland. He completed an internship and residency at the University of Maryland Hospital. During World War II, he served in the Army Medical Corps, rising to the rank of captain. A fellow of the American Academy of Family Practice, Dr. Traband was also a member of the Baltimore County Medical Association, the Southern Medical Association, the American Medical Association, and the Pleximeter Club of Maryland (a medical study group). Dr. Traband, who retired in 1982, had served on the staffs of Maryland General Hospital and the Northwest Hospital Center, and had taught at the University of Maryland School of Medicine. A former head of the Maryland Society of Mayflower Descendants, Dr. Traband was 77.

No additional information was available at press time for the following members:

Ali H. Afrookteh, M.D.
Baltimore County, October 9, 1993

Thaddeus H. Elder, Jr., M.D.

John T. Smith, M.D.
Anne Arundel County, May 1, 1993 ■

Erratum

In the October 1993 *Maryland Medical Journal*, Lawrence W. Malin, M.D., was listed in "In Memoriam." Carl J. Houmann, M.D., writes that Dr. Malin is very much alive and well in Adelphi, Maryland, although Dr. Malin's wife, June, passed away a few months ago. The *MMJ* regrets the error.

DIRECTOR

Internal Medicine Residency Program

The Greater Baltimore Medical Center (GBMC), a 372-bed community teaching hospital located in suburban Baltimore is seeking a physician executive to provide effective leadership to the hospital's Internal Medicine Residency Program. Structured to meet new RRC standards, our primary care focused curriculum is designed to emphasize continuity, ambulatory, preventive and psychosocial aspects of the practice of medicine.

The Internal Medicine Residency Program, which is one of four residencies at GBMC, has 29 medical residents and a core faculty of five internists/educators.

The Director's responsibilities include curriculum development, administration and oversight of programs, clinical teaching and patient care.

We seek an enthusiastic, board certified internist with significant commitment to educational excellence, quality patient centered care and the training of physicians. Demonstrated teaching, administrative and residency experience is essential.

The successful candidate will enjoy a competitive salary with incentives and a full complement of benefits. If you have an interest in this opportunity, please call Tom Battles at 410/828-3649 or send a copy of your curriculum vitae to:

Thomas E. Battles

GREATER BALTIMORE MEDICAL CENTER

Auxiliary

Mini-internship pilot program in Anne Arundel County

This past fall, the first Maryland mini-internship program was sponsored by the Anne Arundel County Medical Society and the Medical Society Alliance (formerly the Auxiliary) of Anne Arundel County (AACO). The AACO program, designed to promote communication between physicians and the people they say are shaping their lives (politicians, government officials, and consumer advocates), was patterned after a similar program sponsored by the American Medical Association (AMA) and closely followed the AMA guidelines. Susan Clark, one of the original drafters of the program, was kind enough to introduce the program to the AACO Medical Society.

After the board was sold on the program, Mary Morin, AACO Medical Society executive secretary, and I began planning. The Alliance's role was to provide support and follow-up and keep the program on track. Ms. Morin handled the administrative responsibilities, including sending the prepared letters from the AMA.

The next step was the establishment of a committee, which worked hard over a six-month period to plan the orientation dinner, the actual two-day internship, and the debriefing dinner. Dr. Raymond and Imelda Herzinger graciously hosted the orientation dinner, which was a great introduction for all participants.

The first program was purposely kept small—5 interns and 11 physicians participated. Interns included County Councilperson George F. Bachman, Jr.; Delegate John G. Gary, Jr.; Edna Butcher, state director of the American Association of Retired Persons; and County Health Officer Frances B. Phillips. Physicians represented emergency medicine, family medicine, surgery, and other specialties.

The interns spent part of two days at work with the physicians. Interns and physicians were able to share concerns and voice their opinions. The mini-internship program enabled participants to learn more about medicine, how the growth of managed care has changed medical practice, and how the practice of medicine will change as the result of health system reform.

The program's goal was to foster two-way communication between physicians and those interested and involved in health care decision making. It is one step in establishing long-term relationships that can ensure that physicians will be involved in health system reform efforts.

The program was well received. Comments included "It was very helpful to me," "It was a wonderful opportunity for the medical profession and average citizens to get to know each other better," and "The physicians were extremely helpful and patient; thanks for including me."

All participants thought the two-day schedule was an appropriate length of time for the internship, although some interns had difficulty scheduling that amount of time away from their own offices. Suggestions for possible participants for future mini-internship programs included malpractice lawyers, insurance company representatives, religious leaders, senior citizens, small business leaders, and television newscasters.

The AACO Medical Society and the Medical Society Alliance of AACO plan to have the program become a yearly event. Many AMA resources are available for counties that would like to host similar programs. If anyone would like additional information about the AACO program, please call me at 410-266-8230.

JOY EPSTEIN
Ms. Epstein is president-elect of the Medical Society Alliance of Anne Arundel County. ■

MARYLAND

The Auxiliary always welcomes new members.

Auxiliary members support the physicians and are recognized for their contributions to health, education, and the promotion of quality health care in Maryland.

A Message to my Patients about Maryland's Number One Public Health Problem

The Medical and Chirurgical Faculty of Maryland (state medical society) is part of a new coalition dedicated to fighting the leading cause of preventable death in our state: *Tobacco*. More of our citizens die each year from smoking-related illness than from alcohol, heroin, crack, homicides, suicides, car crashes, fires, and AIDS (acquired immunodeficiency syndrome) combined. Maryland now has the second highest cancer death rates in the country. Tobacco is also a leading cause of heart disease, stroke, amputations, bronchitis, and emphysema, and costs our state millions in wasted health care spending.

I believe the best way to save lives is to let our state legislators know that we as citizens are tired of having the tobacco industry determine our state laws. It is easy to contact the state senator and delegates representing your legislative district. The state Board of Elections (1-800-222-8683) will give you the number of your local elections board, and the names, phone numbers, and addresses of your state legislators. I am asking you to make a simple phone call to your state representatives. Photocopy and pass this notice on to a friend.

Tell your delegates that you feel strongly about the following set of principles endorsed by the Coalition for a Smoke-Free Maryland, which includes the state medical society, the American Lung Association of Central Maryland, the American Cancer Society—Maryland Division, the American Heart Association—Maryland Affiliate, and others. To find out how else you can help, call the coalition at 410-339-7108. Together, we can make a difference!

Statement of Principles

1. Children should be protected by the enforcement of laws against selling tobacco to minors. Laws should include increasing fines and mandating eventual suspension and revocation of licenses for those who repeatedly sell tobacco to minors.
2. Children should be protected by limiting the placement of tobacco vending machines.
3. Employees should be protected by law in their right to a smoke-free work environment.
4. The public should be protected by making enclosed public places free of environmental tobacco smoke.
5. The state should not preempt counties and municipalities from enacting stronger legislation.
6. The state should increase taxes on all tobacco products.

The Coalition for a Smoke-Free Maryland Fact Sheet

Tobacco represents the leading cause of preventable death in Maryland and in the United States. It is our country's most important public health problem. Tobacco annually kills over 400,000 people in the United States, more than heroin, alcohol, crack, homicides, suicides, car crashes, fires, and AIDS (acquired immunodeficiency syndrome) combined. Our state now has the second highest cancer rates in the country. In addition to cancer, tobacco is also a leading cause of heart disease, stroke, bronchitis, emphysema, amputations, gastric disease, and other diseases.

The great majority of smokers became addicted before the age of 18. One million children and teenagers become addicted each year. This illegal teenagers' market represents $1.7 billion in annual United States sales and is the way the tobacco industry replaces the 1,200 smokers who die each day. This is why the industry has fought in Maryland to perpetuate the toothless law that has made it illegal to sell tobacco to minors for a century, but which is never enforced.

Enforcement of these laws would lead to significantly lower rates of teenage tobacco addiction. We do not allow our children to buy liquor; we should not let them become addicted to tobacco.

The United States Environmental Protection Agency (EPA) recently declared second-hand smoke or environmental tobacco smoke (ETS) to be a class A carcinogen—in the same class as asbestos and radon. In July 1993, the EPA officially recommended that all buildings open to the public have separately ventilated smoke- free areas, or be completely smoke free. The United States surgeon general has reported that over 50,000 nonsmokers die annually from other people's tobacco smoke. That annual figure almost equals the number of Americans killed (58,000) in the eight years of the Vietnam conflict.

Surveys have shown that virtually 100% of vending machines allow cigarette sales to minors. The earlier smokers becomes addicted, the less likely it is that they will be able to quit. If individuals can make it through their teenage years without smoking, however, it is likely that they will never smoke.

Increasing the tobacco tax leads directly to a decreased incidence of smoking, especially among young people. Each 26.5 cent tax raise would bring in over a hundred million dollars in state revenues. Lower smoking rates would save even more, as Maryland spends over $500 million annually on smoking-attributable health care costs.

Nicotine is more addictive than heroin. It is the most addicting drug known. Nine out of 10 children who start smoking will become nicotine addicts, compared with 1 out of 6 for crack.

Physicians dedicated to the health of America

For Your Benefit

Clinton's plan has AMA elements, yet medicine cannot endorse it

The AMA neither endorsed nor opposed President Clinton's entire health system reform plan, saying it will continue to maintain dialogue with the administration, congressional leaders, and Republican and Democrat sponsors for other proposals to ensure nonpartisan discussions result in final legislation "that puts our patients first."

"We disagree with certain of the president's strategies to achieve commonly shared goals, and we will neither endorse nor oppose the president's preliminary plan in its entirety," the AMA said.

Although it welcomed Clinton's affirmation of many AMA reform principles, the Association warned that the plan's reliance on price controls and overregulation, and its new layers of governmental bureaucracy will limit patient and physician choices, lessen the quality of medical services and undermine the mutual trust between patient and physician.

"While the president proposes rigid spending limits that would also limit resources for patient care, the plan does not consider adequately other major cost-saving areas like liability and antitrust reform," the AMA said.

Financing and implementation issues continue to cause concern as Clinton did not clearly address how he plans to finance reform and that his timetable to enact the plan may be "too aggressive."

The Association cautioned that "heavy reliance on cuts in Medicare and Medicaid for financing is an unrealistic, short-term solution that could threaten medical services for the poor and elderly in the future."

AMA stated Clinton may be creating expectations that cannot be met.

"If anticipated savings fail to materialize from his reform plan, deep reductions in medical services may follow, as many leading economists warn, thus defeating reform's primary purpose," the AMA said.

Actual legislative specifications of Clinton's plan are expected in October. Clinton's speech "is just the beginning of the most important domestic debate of our lifetime," the AMA said.

Dialogue between the administration and AMA will continue during the next stages of the reform process.

The Association also is meeting with congressional leaders and sponsors of Republican and Democratic system reform plans.

Prepared by the AMA Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Clinton answers AMA's 10 questions on health system reform

President Clinton answered the AMA's 10 questions on health system reform and included his responses in the White House press kit handed out prior to his congressional speech.

The 10 questions, a handout prepared by the AMA entitled "Is the Clinton proposal for health reform good for you and your family?" originally was designed for physicians to hand out to patients and post in reception areas to encourage open discussion between them.

AMA responses to the 10 questions are included in the all-physician mailing.

AMA directs concerns to Congress; sends analysis of Clinton proposal

The AMA told Congress that organized medicine remains "extremely concerned that any approach not rely too heavily on new and complicated levels of government regulations and restrictive cost containment."

AMA directed this message to every U.S. congressional member in a letter outlining medicine's concerns with the president's health system reform plan.

"We cannot and will not endorse any proposal that could shortchange our patients," the AMA said. This AMA message is timely as Congress begins to analyze and debate the Clinton administration's plan and other system reform proposals.

"Health system reform should not install new structures or limitations that could artificially limit patient choice, do too little to ensure high-quality medicine or rob patients of the security of established patient-physician relationships," said AMA EVP James S. Todd, MD.

An analysis was sent with the letter, highlighting areas of AMA agreement and disagreement with the Clinton plan. It cited "substantial differences with certain approaches in the president's plan."

RUC recommends case management, prolonged service updates

The AMA's Relative Value Scale Update Committee, RUC, provided HCFA with final recommendations for 243 CPT codes that currently have no assigned value in the Proposed Rule as published in the July 14 *Federal Register.*

New code recommendations for case management and prolonged physician services address two important developments in today's primary care medical practice that will improve the quality of care while reducing its costs.

"Care Plan Oversight" codes will fill a major gap in the coding system by allowing physicians to report case management of homebound or nursing home patients who, because of disability, frailty or distance, cannot get to the office. They also are used for the patient whose condition frequently changes and requires substantial care oversight.

"Prolonged Physician Services" codes will provide incentives for physicians to provide care in the most appropriate setting, reducing frequency of expensive emergency department visits and hospital admissions.

HCFA also intends to provide national relative values for additional non-Medicare covered services, such as pediatrics and preventive medicine.

Prepared by the AMA Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families. The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (410)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (410)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. Medical and Chirurgical Faculty of Maryland

Physician Rehabilitation Committee

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects),*

Information for AUTHORS

membership and legislative news, continuing medical education notices, and programs and policies of the faculty.

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

November, 1993
Revised Regulations On Selected Communicable Diseases

On July 5, 1993, the amendments to Code of Maryland Regulations, Summary of New Regulations (COMAR) 10.06.01 Communicable Diseases became effective. Below is a summary of the major changes:

IMMUNIZABLE DISEASES

- Adds requirements for immunity to measles and rubella for new hospital workers working 20 hours per week or more ("immunity" defined as one dose of vaccine after age 12 months or proof of immunity by blood test)

- Requires physicians to offer pneumococcal vaccine to those at increased risk or to refer to health care provider who has agreed to administer pneumococcal vaccine

AIDS/HIV

- Defines "symptomatic human immunodeficiency virus (HIV) infection;" this term was not previously defined in regulation

  Note: generalized lymphadenopathy in an otherwise asymptomatic patient is not reportable but symptomatic HIV infection and AIDS are reportable

- Requires a physician in attendance upon an individual with HIV infection to provide or to arrange for the provision of an evaluation and appropriate therapy for tuberculosis infection or disease

TUBERCULOSIS

- Adds a provision for medical supervision of those with tuberculosis who have not received adequate therapy

- Requires a physician in attendance upon an individual with HIV infection to provide or to arrange for the provision of an evaluation and appropriate therapy for tuberculosis infection or disease

ENTERIC DISEASES

- Changes the requirement of negative stool cultures after salmonellosis and shigellosis from three to two in children attending child care facilities, and adults working in occupations with risk of transmission

- Eliminates the requirement for testing urine specimens in persons with typhoid fever

- Requires a health officer:
  - to supervise a case of typhoid fever until Salmonella typhi-free, and until at least one month after onset
  - to notify carriers of the availability of treatments that may eliminate S. typhi carriage

SEXUALLY TRANSMITTED DISEASES (STD)

- Limits the requirement for follow-up of STDs to syphilis

- Adds provisions concerning congenital syphilis (testing, treatment, reporting)

Veterinary Public Health

- Restricts sale of turtle eggs and turtles less than 4" carapace length

- Specifies certain information to be made available at the sale of pets

Selected Revised Sections of COMAR 10.06.01, Communicable Diseases.

.12 Measles (Rubeola).

D. Proof of Immunity for Hospital Workers.

(1) A worker born after 1956 working at least 20 hours each week who is newly retained as medical staff, a direct or contractual employee, or a volunteer of a hospital classified as a "general hospital" under Health-General Article, §19-307, Annotated Code of Maryland, shall have documentation of receipt of one dose of live measles virus vaccine after becoming 1 year old or proof of immunity by blood test for antibody to rubeola. The hospital shall keep the measles vaccination or immunity status of each worker on file.

(2) Exemptions.

(a) A hospital shall grant a medical exemption for any worker who presents a written statement from a licensed physician or a health officer indicating that immunization against measles is medically contraindicated or detrimental to the worker's health. The statement shall indicate whether the exemption should be permanent or temporary. If the exemption is temporary, the statement shall indicate the date on which the worker is to receive the immunization. A hospital shall withdraw a temporary medical exemption of the day following that date. If the exemption is permanent, the hospital shall maintain a record of the worker's measles antibody test results.

(b) If a worker objects to an immunization upon the grounds that it conflicts with the worker's bona fide religious beliefs and practices, the hospital shall grant a religious exemption to the worker for the immunization. The hospital shall maintain a record of the worker's measles antibody test results.

.12-1 Pneumococcal Disease.

A. There is no control of a case or contacts.

B. Vaccinations of an Individual at Risk.

(1) An individual at increased risk of pneumococcal disease includes an individual:

(a) With anatomic or functional asplenia;

(b) With sickle cell disease;

(c) With human immunodeficiency virus infection;

(d) With chronic heart, lung, liver, or renal disease;

(e) With diabetes mellitus;

(f) Who is 65 years of age or older; or

(g) Who is a resident of a long term care facility.

(2) A physician in attendance upon an individual at increased risk of pneumococcal disease shall:

(a) Educate that individual or the individual's legal guardian on the availability of pneumococcal vaccine; and

(b) Administer pneumococcal vaccine to a consenting individual who has no contraindications and who is at increased risk of pneumococcal disease, or refer the individual to a health care provider who has agreed to administer pneumococcal vaccine to an individual at increased risk of pneumococcal disease.

.15 Rubella (German Measles).

D. Proof of Immunity for Hospital Workers.

(1) A worker born after 1956 working at least 20 hours each week who is newly retained as medical staff, a direct or contractual employee, or a volunteer of a hospital classified as a "general hospital" under Health-General Article, §19-307, Annotated Code of Maryland, shall have documentation of receipt of either one dose of live rubella virus vaccination on or after becoming 1 year old or proof of immunity by blood test for antibody to rubella. The hospital shall keep the vaccine or immunity status of each worker on file.

(2) Exemptions.

(a) A hospital shall grant a medical exemption for any worker who presents a written statement from licensed physician or a health officer indicating that immunization against rubella is medically contraindicated or detrimental to the worker's health. The statement shall indicate whether the exemption should be permanent or temporary. If the exemption is temporary, the statement shall indicate the date on which the worker is to receive the immunization. A hospital shall withdraw a temporary medical exemption on the day following that date. If the exemption is

permanent, the hospital shall maintain a record of the worker's rubella antibody test results.

(b) If a worker objects to an immunization upon the grounds that it conflicts with the worker's bona fide religious beliefs and practices, the hospital shall grant a religious exemption to the worker for the immunization. The hospital shall maintain a record of the worker's rubella antibody test results.

.16 Salmonellosis.

A. Control of a Case.

(1) A case may not attend a child care facility until the:

(a) Case's fecal cultures are Salmonella-free on two consecutive specimens collected not less than 24 hours apart and not sooner that 48 hours following discontinuation of antibiotics (if antibiotics have been given), or . . .

(2) A case with or without diarrhea may not participate in an occupation involving food handling, patient care, or care of young children or the elderly until:

(a) Fecal cultures are Salmonella-free on two consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotics (if antibiotics have been given); or . . .

.17 Sexually Transmitted Disease Syphilis.

A. Control of a Case.

(1) A physician in attendance upon an individual who appears to have, or who has syphilis in a stage which is or may become communicable, shall instruct the individual in the use of any measure, and render any treatment which may be necessary to prevent the spread of the disease.

(2) An individual under medical observation for diagnosis or under treatment for syphilis, shall remain under medical supervision until the: . . .

(b) Syphilis, if present, has been reported to the health officer; and . . .

(3) A physician in attendance shall report to the health officer immediately and in writing the name and address of an individual who is:

(a) Receiving or has received treatment for syphilis; or

(b) Under medical observation for diagnosis or treatment of syphilis in an infectious or potentially infectious stage, who fails to return for observation or treatment within 1 week of the date of a missed appointment, and is not known to the attending physician to be under medical observation or treatment elsewhere for this disease.

B. Control of Contacts.

(1) A physician in attendance upon a patient having syphilis shall:

(a) Endeavor to bring an individual with whom the patient has had potentially infectious contact to examination and epidemiologic treatment by:

(i) Requesting the health officer to conduct a contact investigation of any case of syphilis; or

(ii) Interviewing the patient in order to ascertain the names, descriptions, addresses, and telephone numbers of those with whom the patient has had potentially infectious contact; and

(b) Report immediately to the health officer any untreated individual identified as having had potentially infectious contact with an individual having syphilis.

(2) A health officer shall:

(a) Investigate and notify immediately an individual reported under the provisions of §B(1)(b), of this regulation, who is within the health officer's jurisdiction, to submit to a medical examination to ascertain whether the individual is infected with syphilis. . . .

(3) A reported individual shall:

(a) Within 1 week of notification, be examined by a licensed physician to ascertain whether the individual has been infected with syphilis, and

(b) Be treated with a regimen appropriate for the stage of syphilis to which the individual has been exposed.

C. Infection Control. A health care provider shall practice drainage/secretions precautions until 24 hours after the start of effective therapy on cases of syphilis with potentially infectious lesions.

D. Congenital Syphilis

(1) A physician in attendance upon a pregnant woman shall:

(a) Serologically test her for syphilis in accordance with Health-General Article, §18-307, Annotated Code of Maryland;
(b) Render appropriate treatment within 1 week whenever syphilis, in any stage, is diagnosed; and
(c) Report the case to the health officer immediately.

(2) A physician in attendance upon an infant born to an untreated woman who has a positive serological test for syphilis shall:

(a) Evaluate the infant for possible congenital syphilis and render all indicated treatment; and
(b) Report immediately to the health officer the following information:

(i) The name, address, and telephone number of the mother,
(ii) The results of the serological testing, including titers, and
(iii) The results of the medical evaluation for congenital syphilis for the infant.

(3) A health officer shall:

(a) Investigate immediately an individual reported to the health officer under the provisions of §D(1)(c) and (2)(b) of this regulation, who is within the health officer's jurisdiction; and
(b) Forward immediately to the Secretary a report of an individual reported under the provisions of §D(1)(c) and (2)(b) of this regulation who is outside the health officer's jurisdiction for referral to the health officer of the proper jurisdiction.

.19 Other Sexually Transmitted Diseases.

C. Prevention of Gonococcal Ophthalmia Neonatorum.

(1) A birth-attending physician or certified nurse-midwife shall apply to both eyes of the newborn one of the following prophylactic agents:

(a) A 1-percent silver nitrate solution provided in individual wax ampules for the prevention of gonococcal ophthalmia neonatorum;
(b) Tetracycline ophthalmic ointment; or
(c) Erythromycin ophthalmic ointment (USP).

(2) A birth-attending physician or certified nurse-midwife shall document in the newborn's medical record the application of the prophylactic agent, the name of the agent used, and dose strength.

.20 Shigellosis.

A. Control of a Case.

(1) A case may not attend a child care facility until the case's fecal culture are Shigella-free on two consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotics, if antibiotics have been given, or until the health officer approves readmission based on the low likelihood of disease transmission.

(2) A case, with or without diarrhea, may not participate in occupations involving food handling, patient care, or care of young children or the elderly until the case's fecal cultures are Shigella-free on two consecutive specimens collected not less than 24 hours apart and not sooner than 48 hours following discontinuation of antibiotic, if antibiotics have been given, or until the health officer approves resumption of occupational duties based on the low likelihood of disease transmission.

.22 Tuberculosis.

A. Control of a Case.

(5) A health officer may require an individual having tuberculosis in a non-communicable stage to be under medical supervision if the individual refuses to receive adequate chemotherapy.

Copies of COMAR 10.06.01 containing the entire set of regulations should be available by the end of the year. Please call Mrs. Rice-Thomas at 410-225-6712.

SOUND PROTECTION

Princeton knows professional liability insurance.

And we know the disquieting reality. No matter how excellent your skills, you can still be drawn into a medical malpractice lawsuit.

We provide a strength that's instrumental to peace of mind. Just note our success rate over the last four years for cases in the courts: 95 percent were resolved in favor of our policyholders.

That's sound protection for doctors who choose Princeton.

Princeton. It's worth it!

Straight Talk. Doctor-To-Doctor.

When you're tired of playing games with risk retention groups or insurance companies, we'll be glad to give you the straight talk you need to make your best choices.

Straight talk about coverage options, premium discounts, free retirement coverage, risk management programs, and all the kinds of choices doctors really need.

Where did we learn to talk like this? Simple. We're run by doctors, and doctors are too busy to play games.

To learn more about joining the thousands of your physician colleagues insured by Medical Mutual, call us at 1-800-492-0193.

Doctor-to-doctor. What better way to hear it straight?

Rally in Annapolis for Handgun Control

Marylanders Against Handgun Abuse (MAHA) and the Standing Against the Gun Epidemic (STAGE) coalition are sponsoring a rally in Annapolis for handgun control on Monday, January 17, 1994, at 5:30 p.m. Transportation to Annapolis is being provided from Memorial Stadium at 33rd Street in Baltimore leaving at 3:30 p.m. For additional information, contact MAHA at 410-889-1477.

Statewide Substance Abuse Education Program Initiated

On October 1, 1993, Med Chi, with support from the Governor's Drug and Alcohol Abuse Commission, initiated a statewide substance abuse education program. The program focuses on screening, counseling, and referring substance-abusing patients. It will be offered to Maryland's primary care physicians as a continuing medical education course and in a self-study guide format. Courses are already being set up throughout the state. For more information about the program, or to schedule a presentation, please call Carmine M. Valente, Ph.D., at 410-539-0872 or 800-492-1056.

Study Group for Alternative Medicine

"Alternative Medicine in an Academic Hospital Setting" will be the topic of a talk by Brian Berman, M.D., at the second meeting of Med Chi's Study Group for Alternative Medicine. Dr. Berman is assistant professor of anesthesiology and family medicine at the University of Maryland Medical Center and director of the Laing-University of Maryland at Baltimore Complementary Medicine Project. The meeting will be held at Med Chi on January 19, 1994, at 7:00 p.m. Please call Steve Jones at Med Chi at 410-539-0872 or 800-492-1056 or Hiroshi Nakazawa, M.D., at 410-644-1502 if you wish to attend or receive additional information.

Fourteenth Annual Med Chi Photo Contest

Med Chi physicians and auxiliary members are encouraged to enter the 14th Annual Med Chi Photo Contest. First and second prizes will be awarded in both color and black-and-white categories. All photographs submitted for the contest will be displayed during the 1994 Med Chi Annual Meeting at the Ramada Inn and Convention Center in Hagerstown, Maryland. For complete contest rules, see the last page of this *Chief Executive Officer's Newsletter*.

Award for Excellence in Organized Medicine

In the coming months, Maryland medical school deans will be asked to nominate senior medical students who have made outstanding contributions to organized medicine. Physicians who know or work with medical students are encouraged to tell these students about this award. Medical students are urged to contact the dean of their medical school to express their interest. Students must be members of Med Chi and must be involved in organized medicine. The award consists of a handsome engraved plaque and will be presented during Med Chi's annual meeting.

1994 Med Chi Annual Meeting

Plan to attend the 1994 Med Chi Annual Meeting being held Thursday, May 12 through Saturday, May 14, 1994, at the Ramada Inn and Convention Center in Hagerstown, Maryland. The theme of the meeting is "Medicine Under Health System Reform—Impact on Patients and Physicians." Watch the *Chief Executive Officer's Newsletter* for more information.

AMA Letter to President Clinton Explains AMA Health System Reform Position

In a letter dated December 15, 1993, AMA president James S. Todd, M.D., outlined the common goals of, and the differences between, the Health Security Act and the AMA's proposal for health system reform. Common goals include universal coverage, community rating, portability, administrative simplicity, and choice. Areas of "significant disagreement" cited by the letter are excessive governmental regulation, the lack of protection of the physician's role in medical decision making, and the absence of meaningful liability reform. The letter also requests an opportunity to meet with the President before Congress reconvenes to "narrow the policy differences between the Administration and the AMA in advance of formal Congressional action."

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

HEALTH SYSTEM REFORM

MEMORANDUM

TO: All Members
FROM: George S. Malouf, Sr., M.D.
AMA Delegation Chairperson
DATE: December 1993
RE: Initial Report on the 1993 AMA Interim Meeting (I-93)

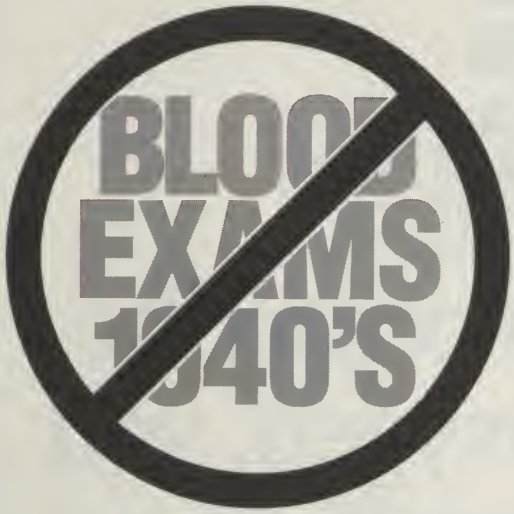
From December 5 through 8, 1993, the American Medical Association (AMA) held its interim meeting to review and discuss the AMA's policies on a variety of issues. During this meeting, over 86 reports and 130 resolutions were reviewed. One of the critical issues the House of Delegates discussed was health system reform.

Throughout the meeting, various issues surrounding health system reform were debated. However at the meeting's conclusion, the delegates overwhelmingly reaffirmed the medical profession's support for two major concepts addressing patient care: universal health insurance coverage and universal access to health care services. To achieve these goals, the AMA is recommending flexibility for financing health care and is supporting both employer-required and individually required and individually owned health insurance. The AMA believes that in order to achieve effective health system reform, all options for financing health coverage must be explored.

In addition, the AMA adopted a resolution that insists that health system reform plans: (1) are not biased toward managed care and include a true fee-for-service option, including balance billing; (2) allow physicians and patients choice of plans and physicians; (3) alleviate regulatory hassles and preserve high quality care; (4) provide meaningful antitrust relief, including the ability for state and county medical associations to form partnerships of physicians for the purpose of being "accountable health plans"; (5) provide true tort reform; (6) provide significant insurance market reforms; (7) recognize the physician's unconditional responsibility and authority in medical decision making and treatment; and (8) provide universal access free from rationing, and to include reasonable basic benefits, patient education, and significant patient responsibility for their own health care choices and behavior.

As a result of your delegates' diligent and careful work during the interim meeting, amendments proposed by the Maryland Delegation to various resolutions were adopted by the AMA. While the various health reform bills work their way through Congress, the AMA and the Medical and Chirurgical Faculty of Maryland will continue to work aggressively to ensure that reform provides our patients with the quality health care and health care security that they deserve. We ask for your continued support as we work with the Clinton administration and our representatives to shape the future of health care in America.

Enter the Fourteenth Annual Med Chi Photo Contest!



Deadline for entries is Friday, March 25, 1994.
Two categories: black & white OR color.
Open to all Med Chi and Auxiliary members.
First and second prizes awarded in each category.
All entries will be displayed at the 1994 annual meeting at the Ramada Convention Center, Hagerstown.

Photo Contest Rules:

Eligibility: All members of Med Chi and members of the Auxiliary may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

1. Photographs may be submitted in two categories: black and white OR color
2. Limit: three entries per person.
3. Prints only; prints smaller than 8" x 10" or larger than 11" x 14" will not be accepted. If your favorite shot is a slide, you must have a print made within this size range to enter the contest.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to Med Chi, 1211 Cathedral Street, Baltimore, MD 21201 by 5:00 pm on March 25.
7. Photographs entered in the contest will be on display at the 1994 annual meeting.
8. Prizes will be awarded to the first and second place winners in each category..
9. Winners will be announced at the annual meeting of the Medical and Chirurgical Faculty, May 12-14, 1994.
10. Photographs will not be mailed back. They may be claimed at the exhibit area at the close of the annual meeting at noon on May 14 or at Med Chi thereafter.
11. Med Chi does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

"People who care for people who need care"

Med Chi is ready to meet your needs in Annapolis

Angelo J. Troisi, F.A.C.H.E.

Mr. Troisi is chief executive officer of the Medical and Chirurgical Faculty of Maryland.

After President Clinton announced his health system reform plan, it seemed that every headline addressed the same issue. But one headline in the *Evening Sun* editorial pages put it best, "Health reform has its own life." No where is this more evident than in the legislative arena. This is why we have worked so hard to put together a team to represent, in Annapolis, all the physicians of this state.

Although health system reform and, more specifically, HB 1359, the Health Care and Insurance Reform Bill, received a vast majority of the public's attention, many other issues were tackled by our legislative team in 1993. They worked diligently on issues of self-referral, physician rehabilitation and peer review, tort reform, and office x-rays, to name a few. During the 1994 session, some of these same issues will be raised again. I am confident that the people we have working for you, your practice, and your patients, will meet the challenges of the 1994 legislative session with the necessary mix of experience and enthusiasm.

Early in 1994, Med Chi will be installing an information hotline. Members will be able to access recorded information on topics such as the Clinton health care plan, Maryland's HB 1359, upcoming legislative dates of interest, and other legislative issues affecting the practice of medicine in Maryland.

Med Chi will continue to keep members informed of Maryland's legislative activities through *Legislative Action*, a newsletter published weekly during the session. The newsletter includes a synopsis of each bill, along with the Legislative Committee's action on each bill, and a calendar of upcoming hearings before House and Senate committees.

If you have specific questions or concerns about a legislative matter, please call our Annapolis office at 410-263-4035, or call our Baltimore office at 410-539-0872 or 800-492-1056. Please keep us apprised of your views by submitting letters to the editor, contacting Med Chi staff, and communicating with Med Chi leadership. ■

GREATER BALTIMORE MEDICAL CENTER

Communicating with legislators

Joseph A. Schwartz III, Esq.

Mr. Schwartz is a lobbyist for the Medical and Chirurgical Faculty of Maryland.

The 1994 session of the Maryland General Assembly will convene on Wednesday, January 12, and remain in session for 90 consecutive calendar days until midnight on April 11. Some believe that 1994 will be anticlimactic with respect to health system reform given the debate in Washington, DC, on the Clinton health care package and given that Maryland presented its approach to health system reform with passage of House Bill (HB) 1359 last year. I believe, however, that there will be numerous health system reform proposals precisely because of the ongoing debate in Washington and because of implementation issues surrounding HB 1359.

All members of the Maryland Senate and the Maryland House of Delegates will be up for election in 1994. Historically, election year sessions do not bring many substantive enactments. They always bring a high number of proposals, however, as various individuals begin their campaigns for reelection. Typically, the second and third years of a four-year term are those in which substantive enactments are made.

Because health care has come front and center and will remain so for the near future, it is particularly important for Med Chi and its member physicians to be informed and prepared on the numerous issues. For this reason, Med Chi's Legislative Committee is divided into four substantive subcommittees: Boards and Commissions, Health Insurance, Public Health and Tort Reform, and Medical Practices. These divisions enable the Legislative Committee to provide the proper attention to all health-related legislation.

As a physician and Med Chi member, you may be called upon to testify before the Maryland General Assembly or write letters to your representatives. You should remember that there is absolutely no substitution for preparation in dealing with legislators. (If possible, provide materials supporting your position and examples that clearly demonstrate the impact of the legislation. Be sure to relate how the action you are requesting will benefit a legislator's constituency.)

However, even the best prepared people can lose their audience if they do not present their arguments in a clear, concise manner. The Maryland General Assembly will consider 3,000 items of legislation in 1994. Citizens

Addressing correspondence

Delegate and representatives
The Honorable (full name)
(Complete address)

Dear Mr. (or Ms) (surname):

Senators
The Honorable (full name)
(Complete address)

Dear Senator (surname):

and interest groups will be tugging on legislators' sleeves every hour of the day. Therefore, it is critical that when you present testimony or write letters, you make your statements short, courteous, and to the point. (Limit your letters to one page and one issue.)

Finally, remember that no matter how well prepared you are or how persuasive your argument, legislators may just disagree. It is at this point that you must remain civil in spite of your disappointment, frustration, or anger. It is easy to be a gracious winner; not so easy to be a gracious loser. Civility, even in the face of defeat, may be the characteristic that wins you the next issue.

Preparation, brevity, and civility are the hallmarks of any attempt to communicate with legislators. The Maryland General Assembly is a diverse body (see box) but, as a rule, its members respect and listen to those who provide truthful, direct, and measured information on a consistent basis. ■

Advances and consolidation in the age of health system reform

Angus Everton, Esq.

Mr. Everton is general counsel for the Medical and Chirurgical Faculty of Maryland.

ABSTRACT: *The health care system reform process will require organized medicine to face hard choices in 1994. This article discusses the legislation enacted in Maryland during the last few years, how it may be affected by the Clinton plan, and what issues can be expected to be of concern during the 1994 legislative session. Resolving the differences of opinion and ensuring high quality patient care will require imagination, intelligence, patience, and goodwill on behalf of all parties involved.*

Reform of the nation's health care system will prevail among political issues in the 1990s. President Clinton made it the centerpiece of his election campaign, and now, after the introduction of his administration's landmark reform bill, it may define his presidency. Physicians can expect all aspects of medical practice to be subject to legislative scrutiny, and no significant part of the health care delivery system may remain untouched by the reform process. Barring an unanticipated, profound reversal in the trend of public thinking, the practice of medicine in America will never be the same for its practitioners or its patients.

For Marylanders, health system reform has already arrived. The process had its origins in the 1970s, first with the creation of the Health Services Cost Review Commission (HSCRC), designed to regulate costs and rates of hospitals and related institutions and, subsequently, with the establishment of the Health Resources Planning Commission, founded to control and allocate capital expenditures and resources among medical facilities. Neither of these institutions, however, has a direct, day-to-day influence over the practices of most Maryland physicians. The Health Care Access and Cost Commission (HCACC), created during the 1993 legislative session by House Bill (HB) 1359, will have such an influence; the Clinton plan, if it is enacted in anything like its present form, will have an even more profound effect over the way Maryland doctors practice medicine.

The first recent legislative act to set the stage for health system reform in Maryland was the 1992 enactment of a law establishing a uniform claims form for health insurance claims, based on the Health Care Financing Administration (HCFA) 1500 form. This uniform claims form, which was established by regulation effective October 1, 1993, is an essential component of the data collection process embodied in HB 1359; without a uniform system for claims transmission, medical care data collection would verge on the impossible.

In 1993, the Maryland General Assembly enacted three statutes—HB 1359 (now Chapter 9, Laws of Maryland 1993), HB 1280 (now Chapter 376, Laws of Maryland 1993), and HB 1243 (now Chapter 372, Laws of Maryland 1993)—each of which, without significantly interacting, has the potential to influence medical practice in far-reaching ways.

At this stage, the dark horse of health system reform is the Clinton plan. Introduced to the public by President Clinton on September 22, 1993, the plan would appear to preempt large portions of HB 1359 with a more comprehensive and rigorous federal regulatory scheme, and would replace Maryland's "Self Referral Bill" (HB 1280), altogether. One cannot predict, however, the final form, or even the ultimate passage, of the Clinton plan. In this respect, Maryland health system reform legislation is a "bird in the hand"; it is here, and, from all indications, many legislators believe it will remain here for the foreseeable future.

What follows is a description of Maryland's health system reform legislation and predictions regarding its regulatory and practical applications, as well as some discussion of legislative changes that may be expected in 1994 and thereafter. Finally, the Clinton plan in its permutation as of press time is discussed in terms of how its enactment would affect Maryland's health system reform scheme.

These legislative enactments have the potential to generate much that is good or much that is evil for our health care system delivery and for patients' welfare. It is essential that Med Chi members be leaders in interpreting and applying these laws over the ensuing months and years. At a minimum, every physician in Maryland should know the identity of his or her representatives. If possible, physicians should become personally acquainted with their legislators and keep them informed about what is right for patients and the health care system.

House Bill 1359

HB 1359 was first introduced strictly as a data collection and insurance reform bill. During the early part of the 1993 legislative session, the bill was reintroduced and amended to create a new subtitle in the insurance code that would establish community rating, guarantee issue of health benefit plans, eliminate pre-existing condition provisions, and establish portability of health plans. In this form, the bill was acceptable to the medical profession and consistent with the goals of the American Medical Association's (AMA's) Health Access America.

Changes in HB 1359. Work group meetings were held during late February and early March by the House Economic Matters Committee and Environmental Matters Committee. Without warning, in early March, the bill was completely restructured, amending the portions creating a universal health insurance package to apply only to small business group health insurance, restructuring the commission created under the bill, and establishing a mandatory fee schedule system to cap physicians' (and only physicians') fees. This latter amendment to the bill was introduced late in the afternoon of the last day the Economic Matters Committee considered the bill. The amendment was incorporated into the bill approximately 20 minutes later, without any opportunity for Med Chi or physician input.

Med Chi and specialty society groups mobilized strong opposition to HB 1359 in this form. The Senate Finance Committee held hearings on HB 1359 that were heavily attended by physician representatives. A well-attended physician rally was held in front of the State House; this generated substantial publicity on the essentially unfair and adverse nature of HB 1359 in its new form as applied to physicians. Thereafter, Med Chi was intimately involved in attempting to develop a consensus among groups that would be affected by this legislation. The final outcome was a health system reform bill that, although it does not apply universally to all health insurance in the state, lays the groundwork for eventual universal access. In its final form, HB 1359 is designed to apply to all health care professions regulated by the state.

As enacted, HB 1359 embodies four major areas of legislation: data collection, small insurance market reform, development of practice parameters, and development of a payment system. One provision establishes a system to evaluate the quality of care and performance provided by health maintenance organizations (HMOs). Another provision, inserted in the last moments of the legislative process, establishes controls on charges to payers for diagnostic testing (see box). The act "pays for itself" by funding the commission through charges against payers (two-thirds) and practitioners (one-third).

Medical care database. Section 19-1507 (a) of the act directs HCACC to "establish a Maryland medical care database to compile statewide data on health care services rendered by health care practitioners and office facilities selected by the commission." By July 1, 1995, data collection is to be undertaken through "licensed claims clearinghouses" that will serve as intermediaries between practitioners and payers. It is anticipated that HMO claims and data will ultimately be submitted electronically to the clearinghouses, which would extract the HCACC-required data and then pass the claims to the respective payers.

It is here that Maryland's standard claims form becomes an important factor; HCACC is required to collect data from all payers in categories essentially identical to those included on the standard claims form, such as patients' demographic characteristics; principal diagnosis; procedure performed; date and location where the procedure was performed; and charge for the procedure. The HCACC is also empowered to collect further information at its discretion, for example, to operate the law's payment system.

While one subsection of the bill requires physicians to collect data "for each type of patient encounter with a health care practitioner. . .," a subsequent provision implies that after July 1, 1995, the HCACC may no longer limit data collection to a representative sample for a health care service provided by a health care practitioner or office facility.

There is further ambiguity as to whether data collection will be limited to transactions to be reimbursed by "payers," defined as health insurers, third-party administrators, or self-insured groups. Since the payment system requires the HCACC to consider "the reasonable cost of bad debt and charity care" in establishing each practitioner's resource base, it is necessary that the HCACC collect some data on transactions not covered by health insurance. However, the only mechanism for data collection in the act—through the licensed claims clearinghouses—appears to be designed to collect data only from claims submitted to payers. Apparently, the HCACC will have to create a second system to process non-payer-reimbursed patient encounters, either through the clearinghouses or independent of them.

Once the database is operational, the data will be published, subject to restrictions on patient confidentiality. Data publication will allow consumers to use the database information to help make informed decisions in selecting their health care practitioners. The data will undoubtedly also be used to monitor utilization and will be essential to the operations of the payment system.

Insurance reform. Small group market reform is at the heart of the act. The driving force behind federal and state health system reform is the unavailability of health insurance to a considerable minority of our population. It is hoped the act will promote health insurance access among employees of small businesses, which are defined as employing between 2 and 50 employees. The act was confined to small businesses for two reasons. First, small businesses have the most difficulty obtaining employee health insurance at an affordable price; second, larger businesses are permitted to self-insure under the federal ERISA (Employee Retirement Income Security Act) law, and it was thought that these federally authorized self-insurance plans could not easily be brought under the regulatory jurisdiction of HCACC. The act does contain two trigger provisions, automatically extending its effect to the general health insurance market if (a) 60% of the population under 65 years of age would receive health care coverage through a small business insurer or HMO, or (b) if the federal ERISA is amended to allow states to control employee health benefit plans. It is unlikely that these events will occur, although the latter is more possible than the former.

The weakest aspect of this small business reform is that while insurers, in order to participate in the small business market, must offer the comprehensive standard health benefit plan to be developed under the act, small businesses are not obligated to purchase it. If, however, a small businesses does wish to purchase health insurance for its Maryland employees, it will be obligated to purchase a plan simply because no health insurer may offer less.

Under Section 4 of the act, which is an unmodified section, a Maryland Standard Benefit Plan Task Force was created to advise the HCACC on the initial development of the standard comprehensive health benefit plan. This task force was required, by December 1, 1993, to submit recommendations to the HCACC on the overall design of the standard comprehensive health benefit plan, including the specific scope and estimated cost of benefits. According to the act, the plan must offer, at a minimum, the benefits required under federally qualified HMO plans; however, the average community rate for the plan, as determined annually by the HCACC, may not exceed 12% of the average annual wage in Maryland.

The actuarial cost of plans equivalent to that offered by a federally qualified HMO, as determined by the actuary selected by the task force, is close to 12% of the average annual wage in Maryland, and as the HCACC has decided that each of the four types of plans to be offered (health maintenance organization plan, point-of-service plan, preferred provider organization plan and fee-for-service plan) should have identical premium rates, differences in the costs will be reflected in the plans' copayment and deductible provisions. The HMO plans are expected to have the lowest copayment and deductible provisions; the fee-for-service plan may have extremely high copayment and deductible provisions.

These actuarial projections are controversial and appear to favor HMOs; projections by other actuaries have tended to favor fee-for-service plans to a greater degree. A report issued in October 1993 by the federal General Accounting Office stated flatly that "[a]lthough many employers believe that they are saving money from network-based managed care, the evidence has been inconclusive about the extent to which such plans hold down employers' costs."

Over the years, the Maryland General Assembly has enacted many mandated health insurance benefits. Indeed, there are more mandated benefits under Maryland law than under the law of any other state. Because the Maryland General Assembly recognized that it might be difficult to offer an economical health benefit plan including all of the state's mandated benefits, it has provided that the HCACC may exclude any

mandated benefit in formulating the standard comprehensive health benefit plan. In somes instances, this has been the result, although much has been done to make the plan as comprehensive as possible.

Among the most significant provisions of small group market reform under HB 1359 are those that will, over time, eliminate preexisting condition exclusions and require the plans to be community rated. The community rating is not a full community rating—carriers may adjust the community rate for age, predetermined regional geography, and, as approved by the insurance commissioner, family composition. On or before October 1, 1998, the insurance commissioner is required to report to the governor and the Maryland General Assembly on the feasibility and desirability of establishing a pure community rate or of maintaining an adjusted community rate.

A carrier offering coverage under the act to a small business shall offer coverage to all of the employer's employees. There is no portability of benefits under the plan, but community rating and elimination of preexisting condition coverage will minimize problems associated with changes of employment. To sell health benefit plans to small Maryland businesses, an insurer shall file its proposed health benefit plans with the insurance commissioner on or before May 1, 1994.

An extensive section in the law creates a small business health reinsurance pool that provides optional reinsurance coverage to carriers offering the comprehensive standard health benefit plan. While participation in this pool is not mandatory, a carrier choosing not to participate in the pool must provide the insurance commissioner with "an appropriate opinion by an independent qualified actuary that the risk-assuming carrier is able to assume and manage the risk of enrolling small business groups without the protection of the pool."

A reinsuring insurance carrier's liability under the act may not exceed $10,000 in any one calendar year with respect to any reinsured individual, so reinsurance under the act cuts in at a relatively low level. While this may be of considerable benefit to less financially solvent health insurers, it could result in high reinsurance premiums, and stronger health insurers may be expected to avoid participation in the pool if they are able to do so under the act.

Practice parameters. The practice parameter section of HB 1359 had its genesis in a bill offered by the Maryland Society of Emergency Physicians. It was patterned after a Maine program under which practice parameters, if adopted by a majority of members in selected specialty groups, can be offered in evidence by the defense in a malpractice action, providing that proof of adherence to the practice parameters would constitute an absolute affirmative defense to liability in that action. It was believed (and accepted by a number of legislators) that establishment of broadly accepted practice parameters as affirmative defenses would minimize the incidence of defensive medicine by conferring immunity in this situation.

The emergency physicians' bill was incorporated into the Senate health system reform bill, Senate Bill (SB) 349, which was eventually to be folded into HB 1359. Unfortunately, because of intense lobbying pressure from the plaintiffs' trial bar, the bills affirmative defense provision was amended out leaving only a committee to establish practice parameters that could not be admitted into evidence for any reason in a medical malpractice action. Instead, the legislature incorporated a provision requiring that malpractice actions be proved by a "similar community" standard of care, rather than a national standard. The hope was to minimize use of hired gun experts from large medical academic centers out of state, as has become a common occurrence in malpractice litigation.

Removal of the affirmative defense provisions from the bill's practice parameter section largely eliminated the reason for practice parameter legislation. The parameters may be useful for utilization review in the future, however, and if the committee that is still empowered to create these parameters is successful in formulating them, the Maryland General Assembly may elect to revisit the affirmative defense issue and decide to reinstate the defense.

Payment system. HB 1359 includes a health care practitioner payment system modeled after the system recommended by the American Society of Internal Medicine. In some respects, it is patterned after the Medicare Resource-Based Relative Value Scale (RBRVS), with two critical exceptions. First, a resource base consisting of components specifically drafted by the Maryland legislature, not drawn from the federal act, will be assigned to each practitioner. Further, unlike Medicare, the practitioner and the payers may set the conversion modifier, which is the third element of the payment system, so that under ordinary circumstances in the fee-for-service context, the market will determine the cost of each medical service. The statute specifically provides that the conversion modifier may be set either by the payer, by the practitioner, or by an agreement between the payer or patient and the practitioner. Since no general provision in the act prohibits balance billing, if the payer's conversion modifier is less than the practitioner's, the practitioner may make up the difference by billing the patient, unless to do so is otherwise prohibited by law or regulation.

The act does, however, give the HCACC the power to set the conversion modifier for a specialty group if the data collected by the HCACC reflects that that specialty group's payments are not in line with the HCACC's annual health care cost adjustment goals. Prior to setting the conversion modifier, however, the HCACC is required, through "voluntary and cooperative arrangements with practitioners," to negotiate with the affected specialty group for the purpose of reconciling the specialty group's charges for a particular service with the annual goals. The HCACC would act to adjust the conversion modifier only if these voluntary efforts failed.

The "diagnostic test" section: A sheep in wolf's clothing

Physicians have been concerned about the section of the Maryland Health Care and Insurance Reform Act (HB 1359) governing laboratory fees [19-507 (h), p23-24]. This section establishes certain requirements if a physician's request for payment includes a charge to a patient for a diagnostic test for which payment may be made by a third-party payer. First, the request must indicate whether the test was performed by the physician or someone in the physician's office, or by another physician or office facility (e.g., laboratory). If the former, the bill must indicate who performed the test. If the latter, the bill must identify the physician or laboratory and include the amount charged to the physician who ordered the test.

The section also outlines payment procedures for diagnostic test services. If services are performed entirely in the physician's office, then the physician may bill the reasonable charge for the test less deductible and coinsurance amounts. If the test is performed in a laboratory, however, the physician may bill the lower of the laboratory's usual, customary, and reasonable (UCR) charge for the test or the amount the laboratory charged the physician plus a nominal fee to cover the physician's costs of collecting and handling the test sample, less deductible and coinsurance amounts.

Physicians cannot charge more than the amounts specified in the section; however, penalties for violation are not specified, nor is an enforcement method established. Additionally, a payer may refuse to pay a bill that does not comply with the section's provisions.

Although the section states that a laboratory's identity must be disclosed on the physician's bill, this requirement is not new. Since 1973, this requirement has existed in the disciplinary provision of the Practice of Medicine Act, now Section 14-404(a)(16), *Health Occupations Article*, Maryland Code.

Many laboratories find it impractical to bill patients or third-party payers directly. To save administrative costs, these laboratories offer substantial discounts to physicians who obtain the specimen, pay the laboratory for its services, and bill the patient or payer. This widespread practice usually saves the patient or payer money. Furthermore, physicians are legally and ethically constrained from padding these bills by Ethical Opinion 108.03.

Therefore, the only new part of Section 19-507(h) is the provision limiting the charge for diagnostic testing to the UCR fee the laboratory would charge the patient directly. Typically, this fee is greater than the amount resulting from combining the physician's charge with the laboratory's reduced charge. In these cases, the law poses no practical problem to the physician as long as the nominal fee charged for collecting and handling the specimen can be economically justified by the physician as covering his or her reasonable expenses in offering these services. If the laboratory does not discount its charges to the physician, however, legal and practical problems arise.

Legally, the section seems to delegate legislative or administrative rule-making power to nongovernmental entities—laboratories—in violation of numerous federal and state decisions prohibiting such delegation. Indeed, it is difficult to imagine any sound legal reason for allowing one set of professionals (laboratory managers) to manipulate the fees of another (physicians), by force of statute.

Practically, if laboratories stop discounting fees to physicians, the cost of collecting and handling specimens for patients may become prohibitive for physicians. Patients would then have to travel to laboratories for diagnostic test services. Some patients, because of illness, disability, or poverty, would not make the extra trip and would forego the laboratory work. Consequently, important tests might not be done, and critical diagnostic information might not be provided.

A further practical problem is that the section does not obligate a laboratory to disclose its UCR fees or be truthful if it chooses to disclose these fees. Therefore, physicians cannot actually determine whether the amount they bill for each service is lawful.

Overall, Section 19-507 (h) should create few problems as long as laboratories continue to substantially discount their charges to the physicians who send them specimens for testing and who agree to bill patients and payers for the laboratory services. Some physicians have expressed concern that this section of HB 1359 might bring the wolf to their and their patients' doors, but as long as laboratories do not change their current practices, Section 19-507 (h) will remain a sheep.

If laboratories do change their practices on a widespread basis, however, health care costs could increase, and the quality of health care could be diminished, transforming the sheep into the wolf.

ANGUS EVERTON, ESQ. ■

At HCACC meetings, it is clear the commissioners do not believe they possess the power to adjust an individual physician's fees. The power to adjust conversion modifiers applies only to specialty groups, in the sense of categories of practitioners, and not to individual practitioners. It appears implicit that this remedy would be applied only rarely.

Comparison of the payment system embodied in HB 1359 with that included in the Clinton plan is instructive. In its present form, the Clinton plan provides that under fee-for-service plans, regional health care alliances are required to set fee schedules for practitioners, and practitioners would be prohibited from balance billing, except to the extent of co-payment or deductible amounts. Unlike the resource-based system in HB 1359, it does not appear that the Clinton plan would make any allowance for differences in practice among affected practitioners, and those differences could not be adjusted through balance billing because of the prohibition. Manifestly, HB 1359 is vastly superior in this respect to the Clinton plan, offering market flexibility to the practitioner, while retaining the power to restrict runaway costs by adjustment of the conversion modifier in extraordinary circumstances.

House Bill 1280

The self-referral bill, HB 1280, first appeared in the 1992 session as HB 1374, where it had a checkered course, ultimately dying in the House Environmental Matters Committee. It finally passed in the 1993 session, largely because of relentless pushing from the Senate president, despite some legislators' wishes that self-referral legislation be submitted to summer study, and despite the substantial likelihood that this act will be preempted by federal legislation.

It is unfortunate that HB 1280 was enacted. In the unlikely event it survives federal preemption, it is almost certain to generate costly, time-consuming interpretive litigation before its scope and effect are fully established. It appears to have the potential to do a great deal of harm, without any clear evidence that it will do any significant good. While no one can seriously argue that practitioner self-referral is ethically inappropriate except under the most extraordinary circumstances, HB 1280 was not itself an appropriate response to the perceived problem.

The heart of the bill is Section 1-302 (a) of the *Health Occupations Article*, Maryland Code, which proclaims that except under certain circumstances, a health care practitioner may not refer a patient or direct an employee or contractor to refer a patient to a health care entity in which there is a beneficial interest or with which there is a compensation arrangement. It further provides that an entity or practitioner may not bill for a prohibited referral, and it provides for certain penalties, including disciplinary penalties, in cases of violation.

Referral definitions. The key to the bill is in its definitions as much as in its exceptions. Specifically, a "referral" is defined as any referral of a patient for health care services, including (1) forwarding a patient by one health care practitioner to another health care practitioner or to a health care entity outside the health care practitioner's office or group practice, or (2) the request or establishment by a health care practitioner of a plan of care for the provision of health care services outside the health care practitioner's office or group practice.

Referral exceptions. While this language is unnecessarily ambiguous, a reasonable interpretation is that referrals within the office or group practice are not referrals at all. The problem, however, arises among the exceptions; at least some of the exceptions appear to apply to group practice operations, even though by definition of "referral," they are excluded from the act altogether. Exceptions to the operation of the act are

- HMO referrals, if the health care practitioner does not have a beneficial interest in the entity (e.g., laboratory or pharmacy);
- another health care practitioner in the same group practice;
- a health care practitioner, with a beneficial interest in an entity, who refers a patient to that entity for tests that are personally performed by, or are under the direct supervision of, the referring health care practitioner;
- a health care practitioner who refers a patient for in-office ancillary services or tests (a particularly convoluted term, which for some reason excludes certain radiology equipment unless it is used in a radiologist's office) if the tests are personally furnished by the referring health care practitioner, a health care practitioner in the group practice, or an employee personally supervised by someone qualified in the group practice, and the test or service is provided in the same building where the referring practitioner furnishes services;
- a health care practitioner with a beneficial interest in an entity if the Department of Health and Mental Hygiene (DHMH) determines that the health care practitioner's interest is essential to finance the entity and the entity is needed to ensure access to the particular care it provides in the community;
- a health care practitioner, employed or under contract with a hospital, who refers a patient to an entity owned by the hospital if the health care practitioner has no beneficial interest in the hospital;
- a health care practitioner who has a beneficial interest in a health care entity owned or controlled by a hospital under the same circumstances; and
- a health care practitioner with certain beneficial interests or compensation arrangements in a hospital or related institution as of January 1, 1993, provided that

the interest or arrangement has not thereafter increased.

As discussed above, the 1993 Budget Reconciliation Act prohibits self-referrals under the Medicare laws. The federal provision is more straight forward than HB 1280, but applies only to Medicare arrangements. The Clinton plan, however, also contains self referral prohibitions, and these elements will probably be enacted. Parenthetically, the American Medical Association (AMA) has come out in favor of a federal anti-self-referral law, so it is reasonable to expect a federal law that will preempt HB 1280.

By its terms, the prohibitive provisions of HB 1280 do not apply to arrangements in effect as of January 1, 1993, until January 1, 1997. Prior to the latter date, however, a self-referral covered under this grandfather clause must be expressly disclosed to the patient.

House Bill 1243

The third major piece of legislation to emerge from the Maryland General Assembly in the 1993 session was the Health Care Decision Act, HB 1243. This act represents the culmination of formal efforts to create a coherent, universal policy to deal with problems presented by patients in a terminal condition, a persistent vegetative state, or an end-stage condition and maintained on life support, where it could be determined that the patients, if competent, would seek for cessation of life support.

Presenting advance medical directives. The new law contemplates four ways for presentation of advance medical directives and surrogate decision making. First, the law replaces the existing "living will" with more extensive living will provisions, and an alternate "advance directive," which is similar to a living will but broader and more flexible. Second, the law essentially codifies an existing practice of creating medical powers of attorney under a "health care agency" provision. Again, the health care agent's powers are broader under this law than those heretofore exercisable under a medical power of attorney.

Third, the law sets forth classes of individuals who may make surrogate health care decisions for an incompetent person in the event there exists no advance directive, living will, or designated health care agent. Finally, in the absence of the foregoing, a provision that empowers the guardian of a person, lawfully designated by the court, to make health care decisions on behalf of the incompetent person. The act also contains directions for emergency personnel if "do not resuscitate" orders exist. Another section grants broad immunity from liability to health care practitioners and decision makers who take action under the law.

Health care decision making. A competent adult may express his or her wishes about future health care by one or more of the following methods: (a) written instructions authorizing the provision, the withholding, or the withdrawal of health care; (b) written appointment of an agent to make health care decisions for the patient; or (c) an oral statement to a physician leaving instructions or appointing a health care agent. A written advance directive must be witnessed by two people; neither may be the person's health care agent, and at least one of the witnesses must not have a financial interest in the person's death. An oral advance directive must be made to a physician and witnessed by one individual, and must be recorded in the patient's medical record and be signed and dated by the physician and the witness.

Surrogate health care agents. A health care agent may not be an employee, owner, or operator of a health care facility where the patient is being treated, unless the agent would qualify as a surrogate. Surrogates—who may serve as such if a patient has not picked a health care agent, has not made an advance directive, and is no longer able to make health care decisions personally— include persons from the following classes, in descending order of priority:

- a guardian, if one has been appointed;
- the patient's spouse;
- an adult child of the patient;
- a parent of the patient;
- an adult brother or sister of the patient; or
- a friend or relative who specifies in writing that he or she is a close friend of the patient and provides facts to demonstrate enough regular contact with the patient so as to make the surrogate familiar with the patient's activities, health, and personal beliefs.

If there is a dispute among surrogates of the same class as to the care of a person who is no longer able to make health care decisions personally, the dispute must be referred to an institution's patient care advisory committee, or if the treatment is outside an institution, to a court.

Advance directives. Unlike the existing living will law, which permits withholding of life support except for artificial alimentation and hydration and only when the patient is in a terminal condition, an advance directive may now specify that life support may be withheld if the patient is in a terminal condition, is in a persistent vegetative state as defined in the law, or is in an end-stage condition, which is defined to mean "an advanced, progressive, irreversible condition caused by injury, disease, or illness, that has caused severe and permanent deterioration indicated by incompetency and complete physical dependency and, for which to a reasonable degree of medical certainty, treatment of the irreversible condition would be medically ineffective." The act also authorizes withholding of life support under these circumstances to include artificial alimentation and hydration, if so specified in the advance medical directive.

A surrogate, including a guardian, is empowered under the act to withhold life support treatments to the same extent as under an advance directive, following a complex analysis of what is in the patient's best interest. Again, however, in the case of surrogates and guardians, this may be done only if the patient is in a terminal condition, a persistent vegetative state, or an end-stage condition.

The case of health care agency, however, is otherwise: a health care agent may withhold life-sustaining treatment even if the patient is not in a terminal condition, a persistent vegetative state, or an end-stage condition, provided that the agent's decision is based on the wishes of the patient, or, if these wishes are unknown, on the patient's best interests, as specifically defined in the law. The only check on the agent's power to terminate life support in this situation is the patient's physician, who is authorized to refer the matter to the institution's patient care advisory committee or to a court having jurisdiction in the event that the physician thinks that the agent's instructions to terminate treatment violate accepted standards of medical care. There may well be circumstances under this law when the physician is indeed the patient's last line of defense, in the unlikely but entirely possible event that the agent makes a decision to terminate a temporarily incompetent patient's care from motives other than the patient's best interest.

Considering the protracted and complex negotiations that went into the passage of this act, it is unlikely that HB 1243 will be substantively amended this year.

Projected 1994 legislative interests

HB 1359 amendments. The Health Care Access and Cost Commission (HCACC) has publicly declared that it does not wish to see substantive changes to HB 1359 during this legislative session. The House Economic Matters Committee, through its chairperson, Casper R. Taylor, has expressed the same sentiment, suggesting that the HCACC should be given an opportunity to make the act work on its present terms. The HCACC has, however, compiled a fairly extensive list of relatively technical amendments to HB 1359, among which are some Med Chi–recommended amendments.

The HCACC has indicated to Med Chi, as an exception to its "no substantive amendment" rule, that it will not object to legislation removing the diagnostic testing provisions embodied in the first Section 19-1509 (h). At an HCACC open meeting held on the Johns Hopkins University campus on September 15, 1993, there was general agreement that the diagnostic test provision does not fit into the act's general scheme and is contrary to the payment system embodied elsewhere in the act.

The HCACC has also expressed concern with the "unbundling" definition embodied in the law's provisions dealing with the payment system. The HCACC would rather establish its own definition of unbundling, and staff have suggested that an amendment to this effect could be included in the corrective legislation that the HCACC intends to submit. Med Chi would support this technical amendment to the act also.

"Any willing provider" legislation. On December 1, 1993, Med Chi's Legislative Committee voted unanimously to endorse legislation that would require HMOs and other health insurers to allow any qualified physician to participate in their plans provided the physician was willing to accept the remuneration and other reasonable terms offered in the plans' contracts. Med Chi will seek enactment of such legislation during the 1994 session of the Maryland General Assembly.

Restoring the cap on noneconomic wrongful death damages. During the 1993 session, the Maryland Court of Appeals, in the case of *United States of America v Streidel,* astonished the Maryland legal and medical communities by eliminating the legislatively imposed cap on noneconomic damages in wrongful death actions. Amazingly, the court decided this issue on its own; even the plaintiff in the *Streidel* case had not requested a ruling that the cap did not apply to these actions.

The decision has the potential to wreak havoc on Maryland's medical malpractice insurers and to result, over time, in premium increases translating into thousands of dollars per physician per year. This single decision could be a substantial factor in raising health care costs over the intermediate future, unless the Maryland General Assembly reimposes the cap in these actions. This is so because approximately 20% of all medical malpractice actions are wrongful death actions, and, uncapped, the awards can be very substantial indeed. Several months after the court's opinion was handed down, a Baltimore County jury awarded approximately $7 million in noneconomic damages in a wrongful death malpractice action. There have also been other recent cases in which jury verdicts substantially exceeded $350 thousand predicated on noneconomic loss in wrongful death claims.

Malpractice insurance groups are expected to seek legislation reimposing the cap. Unfortunately, the *Streidel* decision probably cannot be retroactively nullified, so it is urgent that legislation be enacted to rectify this problem in the 1994 session. This will be one of Med Chi's highest priority items during this legislative session.

Health Resources Planning Commission. In September 1993, the Health Resources Planning Commission (HRPC) set up a consensus development group, consisting of physician, hospital, and insurer representatives, to explore whether gastrointestinal endoscopy should be included among those procedures requiring an HRPC certificate of need before being performed in an outpatient ambulatory facility or office setting. A primary question in the case of gastrointestinal endoscopy was whether such a procedure constituted "surgery," for the purpose of evaluating whether it was covered under the statute governing certificates of need, Title 19, Subtitle 1, *Health*

General Article, Maryland Code. More generally, however, HRPC staff have begun a broader inquiry to determine whether the current process of determining which specialties are exempt from the certificate of need requirement—by virtue of a list set up in 1986—is appropriate, or whether such decisions should be based on more rational criteria.

The inquiry was triggered by a hospital demand that all endoscopy be subject to certificate of need requirements. This demand was motivated by a perception that if endoscopy could be performed at a high quality level in an outpatient setting for much less cost than hospital-based endoscopy, hospitals would lose a great deal of money. If the exodus of other types of ambulatory surgery from the hospital setting to safe, inexpensive physician offices became universal, hospitals could lose a great deal of revenue. Indeed, it is reasonably well established that many surgical procedures may be done as safely in an office setting as in a hospital setting, and at substantially less expense.

The potential for a HRPC decision to deregulate in this area is predicated on an exception to the comprehensive health planning law, which excludes from the definition of a "health care facility," "the office of one or more private physicians, podiatrists, or dentists, regardless of whether such office is eligible or receives reimbursement from third-party payers as an ambulatory surgical facility or center, if that office provides services only within a single medical or surgical subspecialty as determined by the Health Resources Planning Commission in regulation, if the office is used only for the physician's patients or patients of the group, and if the office includes not more than four surgical suites." The law further states that for the purpose of the foregoing quoted paragraph, ophthalmology is a single subspecialty and, thus, excluded from the act.

Hospitals, through the Maryland Hospital Association (MHA), are exploring a legislative solution to this financial problem. One possibility is to bring all or most offices within the regulatory control of the HRPC or the Health Services Cost Review Commission (HSCRC). This would drive many offices out of business or cause them to charge rates equivalent to those charged at hospital facilities. Another choice would be to deregulate hospital outpatient ambulatory surgical facilities altogether, so as to level the playing field with the independent office practices.

Needless to say, introduction of legislation requiring universal regulation by the MHA would constitute a declaration of hostilities against the medical profession. Any legislation that needlessly imposes additional regulatory expense on the public would be counterproductive to the purpose of health system reform, as it would seem to be calculated deliberately to impose higher costs on the delivery of high quality health care services.

HMOs and emergency services. During the 1993 legislative session, a number of bills were introduced to address the tension between certain HMOs and certain health care practitioners who are not signed up with the HMOs but who are required to render medical care to the HMOs' subscribers, primarily through emergency rooms. Less scrupulous HMOs have made a practice of paying noncontracting practitioners at absurdly low rates, and collection of the difference from patients has been complicated by questionable interpretations of the anti-balance billing provisions contained in Section 19-710 (o), *Health General Article*, Maryland Code. The new legislation was designed to require HMOs to pay noncontracting practitioners at the rate billed by each practitioner, or at a reasonable market rate.

Most of this legislation was defeated, although two important bills did get through. HB 462, now enacted as Chapter 304, Laws of Maryland 1993, requires HMOs to pay noncontracting practitioners at the rate billed or at the usual, customary, and reasonable rate, and prohibits HMOs from relying on Medicare fee schedules, workers' compensation fee schedules, or, except in the case of medical assistance patients, Medicaid fee schedules. It further places the affirmative obligation on the HMO to disclose the methodology that it uses to determine the usual, customary, and reasonable rate.

Even more important was SB 701, now Chapter 635 of the Laws of Maryland, 1993. SB 701 was designed to terminate the practice of many HMOs of refusing to cover enrollees who went to the emergency room in the belief that their condition was an emergency, when it later turned out not to be an emergency. This act solves this problem by defining an emergency from the perspective of a reasonable layperson, rather than from a health care practitioner's perspective.

It will be Med Chi's task to protect the gains made for physicians and patients in the event that legislation is introduced to undo them, and to continue to seek to rectify the overall situation by appropriate legislation.

Smoking legislation. Med Chi expects to actively support legislation restricting minors' access to tobacco products and smoking in public places during the 1994 session. At its semiannual meeting in September, the Med Chi House of Delegates passed a resolution to support legislation prohibiting smoking in public areas. Further, Med Chi's general counsel was designated in June 1993 to serve as the chairperson of the Legislative Committee of the Coalition for a Smoke-Free Maryland; that committee has worked during the summer and fall developing legislation that will be offered in the 1994 session. The coalition has focused on the following four areas of legislation.

Restrictions on vending machine placement. The coalition has drafted a bill that would restrict minors' access to vending machines. The importance of this legislation was heightened in September 1993 when the Maryland Court of Appeals came down with a decision, in the case of *Allied Vending Company v Bowie,* holding that localities are precluded from passing local ordinances restricting vending machine location.

Minors' access to tobacco products. The coalition has also drafted a bill that will beef up the penalties and enforcement mechanism to prevent the sale of tobacco products to minors, and will also apply similar civil penalties to minors who use false identification to purchase tobacco products. A key facet of this bill is that if a vendor repeatedly violates its provisions within a three-year period, the vendor's cigarette license is subject to revocation.

Smoking in public places. In conjunction with the House of Delegates resolution governing this legislation, the coalition will work for legislation to prohibit smoking in public areas and facilities throughout the state.

Tobacco tax. The coalition has not prepared a tobacco tax bill for sponsorship, but will no doubt recommend supporting the tobacco tax legislation that is expected to be filed at the request of other groups in the state.

The Clinton plan

A draft of the Clinton plan was leaked to the public on the weekend of September 10, 1993. President Clinton described the plan to the public approximately 12 days later in a nationwide television address. Subsequently, the plan has emerged as proposed legislation. Anything said at this juncture about federal health system reform, however, is subject to a very important caveat—whatever emerges from negotiations between the administration and Congress may be enormously different from the plan in its present form. Nevertheless, the present plan's outline gives clear indication of the administration's thinking on health system reform, and a comparison of the Clinton plan with HB 1359 is certainly useful.

The Clinton plan's thrust is to provide health insurance for everyone in the United States, except undocumented aliens, by means of purchase through regional alliances. The concept is that small businesses are in an unequal bargaining position with large industry when it comes to purchasing group health insurance, and it is believed that the alliances, which will purchase several types of health care plans from competing insurers, including one fee-for-service plan, will provide the bargaining leverage that gets the best possible policy at the lowest possible price. The Clinton plan provides for a comprehensive standard health benefit policy, too, and the broad outlines of mandated benefits under this plan include pediatric vision and dental care, and somewhat more expanded mental health benefits—all of which go along with relatively low deductibles and copayments.

One great difference between HB 1359 and the Clinton plan is that the Clinton plan will require all Americans to join the plan; each person will be issued a "health security card," either when the citizen enrolls in the plan or when he or she first obtains medical care after the plan goes into effect.

The first question that arises is: How is this to be paid for? The administration's answer is that along with the tobacco tax, savings will be accomplished through elimination of fraud and waste, and everyone, even the unemployed, are expected to contribute something in premium payments, which in practical terms will actually constitute a universal health care tax. There is some concern that the administration has overestimated the money that can be saved by paperwork reduction, an end to systemic abuses, and elimination of some health care industry jobs.

The administration has pledged a rigorous paperwork reduction scheme centered on a universal health insurance form similar to the HCFA 1500 form, but at the same time, the plan calls for the creation of 100 to 200 new bureaucracies (the alliances), along with a National Health Board, and expanded supervisory and regulatory duties for the United States Department of Labor. Never in history has the creation of new bureaucratic structures been associated with a paperwork reduction; the opposite is the universal rule. It is claimed in the plan that the National Health Board and the Department of Labor will closely monitor quality, and this kind of peer review will require reams of paperwork in itself. If there is a universal health insurance premium, as described, the nation will have to keep close track of its citizenry to be sure that everyone pays. Overall, there will probably be a net increase in paperwork engendered by this plan.

Under the plan, employers will pay at least 80% of their employees' health insurance premiums, but labor organizations may negotiate payment by the employers of up to 100%. There will be subsidies for small businesses and the poor, which will have to be made up from other payments within the system. For the average American who now has health insurance, his or her premiums will rise markedly under the present Clinton plan.

The administration has made much of the fact that the plan will control health insurers' income. Probably, however, the plan will be financed largely by heavy reliance on HMO arrangements under which physicians are paid on a capitated basis, and rigorous fee schedules that will be imposed on fee-for-services practitioners, combined with a balance billing prohibition. In reference to fee-for-service transactions, there does not appear to be any provision for an RBRVS-type payment system under which individual practitioners' resource bases would be taken into account—the plan simply calls for a "fee schedule" and that is it. Of course, as with every aspect of the Clinton plan at this stage, provisions will be thoroughly reviewed in Congress and, through the process of negotiation, are subject to change.

With one notable exception, the plan makes only a few half-hearted stabs at medical malpractice tort reform. The one exception is adoption of a "collateral source rule" to reduce double payments. Otherwise, the plan relies on mandatory

health claims arbitration, certificates of merit, limitation of contingent fees to 33.33%, periodic payment of awards, and an "enterprise liability demonstration project."

Historically, none of these measures have resulted in substantial reduction in the direct cost of the malpractice liability system or the accompanying expenses associated with defensive medicine. Indeed, the "enterprise liability" option will probably work to increase, rather than decrease, the number and amount of malpractice verdicts, since by restricting liability to the practitioners' employers, such a rule would eliminate any compunction juries might have against imposing liability on practitioners personally.

The Clinton plan also contains a provision for "antitrust reform," permitting some limited protection for physicians who negotiate with health plans and form their own plans, and more extensive protection in cases of hospital mergers, hospital joint ventures and purchasing arrangements, and "physician network joint ventures." The plan does give assurance that practitioners who must negotiate their fee schedule with regional alliances under the fee-for-service plans will have some protection from antitrust liability for engaging in the negotiation process.

In the existing plan, nothing explicitly allows waivers for states that have their own health system reform plan, such as Maryland's HB 1359. Thus, the Clinton plan, if enacted in its present form, would supersede or preempt large portions of the Maryland plan. The small group market reform and the payment system contained in HB 1359 would be replaced with the more comprehensive and rigorous federal provisions; Maryland's database, on the other hand, would probably be incorporated directly into the federal system. The practice parameter section of HB 1359 would dovetail neatly into the federal affirmative defense tort reform provision—assuming that provision survives intact in the plan. The annual cost containment goals to be established under HB 1359 would undoubtedly be replaced by the federal global budget provisions.

Conclusion

The health system reform process will continue to require organized medicine to face hard choices—for example, there will be a constant, and sometimes irreconcilable, tension between the desirable goals of universal access to quality health care and mandatory benefits such as comprehensive mental health care and the need for freedom of patient choice of practitioners, for flexibility of health care delivery systems, and for reasonable, traditional means of compensation to ensure that the best care is available to the public from the best trained and most qualified practitioners. Resolving these fundamental tensions will require imagination, intelligence, great patience, and goodwill on the part of all the partners—patients, practitioners, payers, employers, organized labor, and politicians—in our American health care community. ■

A child cries for food.
We doctors must answer.

World hunger is an ever-present scourge that claims 35,000 lives each day.

Physicians Against World Hunger (PAWH) is a non-profit, tax-exempt organization, founded by physicians to defend the basic human right to food. In partnership with well recognized and reputable organizations PAWH supports hunger projects throughout the world.

Together physicians must bring an end to world hunger. We are sworn to protect human life. When people dying of hunger cry out for help, we must respond. Please join us.

The legislative process*

FROM HOPPER TO ENACTMENT

The drafting of legislation requires the skill of experienced and trained personnel. This service is rendered by the Department of Legislative Reference. A bill or joint resolution may be introduced in advance of regular sessions and is styled a "prefiled bill." A bill is filed (is dropped into the hopper) with the secretary of the Senate or the clerk of the House, is given a number, and is readied for its first reading on the floor. Bills may be introduced in either chamber until the last 35 days of the session. After that, bills may be introduced only with the consent of two-thirds of the membership.

First reading. The reading clerk, when the session has convened, reads the title, and the presiding officer assigns the bill to the appropriate committee.

Reference to committee. The committees meet daily during the session to receive testimony and take action on bills assigned. Citizens are encouraged to present their views on the subject matter by mail or by personal appearance. Legislative agents (lobbyists), representing organized interest groups, speak at these hearings, either to oppose or support the proposed legislation. The Department of Fiscal Services prepares a fiscal analysis for each bill, and these fiscal notes are considered during the committee deliberation.

Unfavorable committee action, which may mean legislative death, frequently requires as much, or more, committee discussion and time as favorable committee action, which sends the bill to the floor for a second reading and floor consideration.

Second reading and floor consideration. The bill is reported to the floor by the committee (favorably, unfavorably, or without recommendation, and with or without committee amendment). The bill is open to amendment from the floor, and the ultimate form of the bill must be determined on second reading. Committee action may be reversed, but this is infrequent.

Third reading. The bill must be printed for third reading with all amendments included in this final version. No amendments may be presented on third reading in the chamber of its origin, and the bill must be passed by a majority of the elected membership.

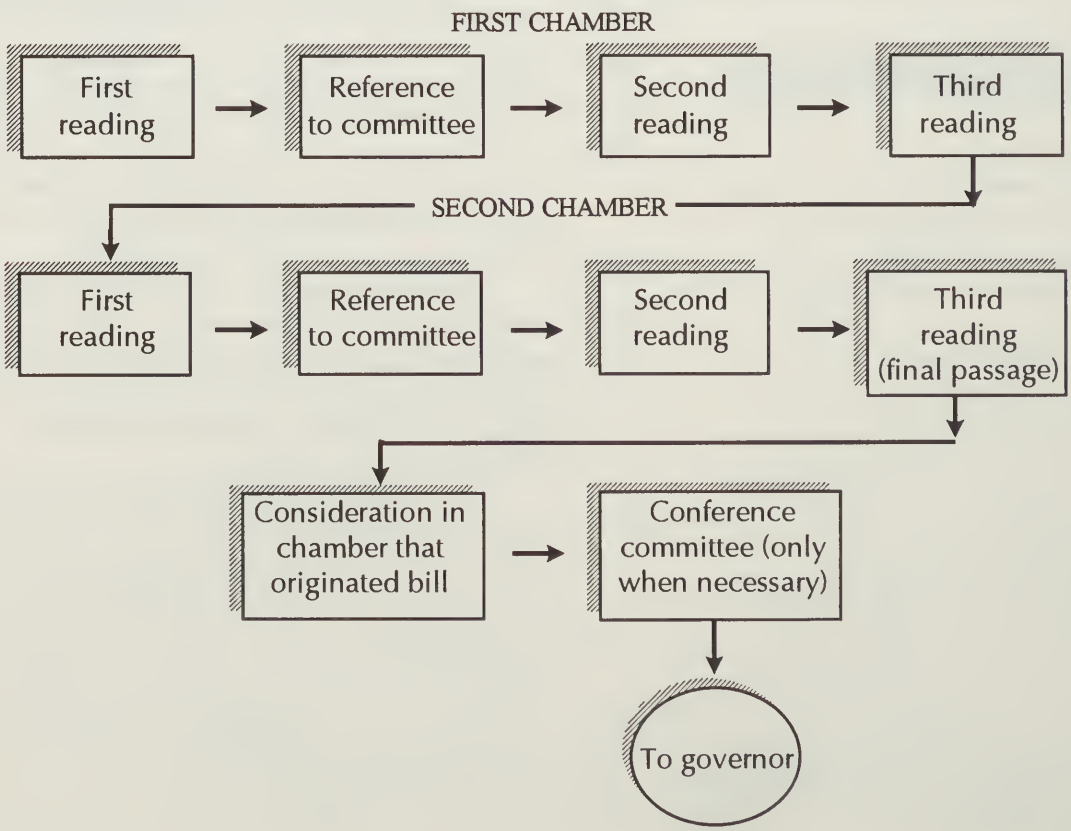
Second chamber. The procedure follows a pattern identical with that of the chamber in which the bill originated, except amendments may be proposed during third reading as well as second reading. If not amended in the second chamber, final passage may occur without reprinting.

* *Information provided by the Maryland Department of Legislative Reference.*

Consideration of bills*

CONSIDERATION OF BILLS ORIGINATING IN ONE CHAMBER AND AMENDED IN SECOND CHAMBER

If amended in the second chamber, the bill is returned to the chamber of origin, where a vote is taken on a motion to concur with or reject the amendments. If concurrence is voted, the bill itself is voted on as amended and action is complete. The bill is reprinted, or enrolled, to include the added amendments, before submitting it to the governor.



If the amendments are rejected, two courses of action are possible: (1) the amending chamber may be requested to withdraw its amendments, or (2) upon refusal of withdrawal of amendments, either chamber may request a conference committee to resolve the differences between the two chambers.

Conference committee. A report of a conference committee goes back to both chambers to be adopted or rejected without amendment. If the conference committee report is adopted, the bill is voted upon for final passage in each house. If the conference committee report is rejected by either house, the bill fails.

Presentation of bills to the governor. Presentation of all bills to the governor is mandatory, except for the budget bill and constitutional amendments. The budget bill becomes law upon its final passage and cannot be vetoed. Bills must be presented to the governor within 20 days following adjournment of a session, and in the case of such bills, the governor may veto them within 30 days after presentation to him or her. If a bill is not vetoed, it becomes a law. The governor may not veto a constitutional amendment.

The power to override a veto. This power rests with the legislature. If a bill is vetoed during regular session, the veto message is considered immediately. If a bill presented after the session is vetoed, the veto message must be considered at the next regular or special session of the legislature, except that the legislature may not override a veto during the first year of a new term. A three-fifths vote of the elected membership in each chamber is necessary to override a veto.

The progress of a bill*

** Information provided by the Maryland Department of Legislative Reference*

Important legislative dates

January 12 ..... General assembly convenes (noon, Wednesday).

January 13 ..... Governor delivers State of the State address.

January 19 ..... Final date for governor to introduce budget bill.

January 21 ..... Final date for submission of executive orders reorganizing the executive branch of state government. (Either chamber may disapprove by resolution within 50 days. Administration bills introduced after this date are referred to the Senate Rules Committee.)

January 25 ..... Senate bill and House bill request guarantee date. (All bills filed by this date *must* be considered by committee.)

January 26 ..... Final date for introduction of Governor's Salary Commission, General Assembly Compensation Commission, and Judicial Compensation Commission recommendations.

January 31 ..... Final date for governor to introduce capital budget bill. (Final date for submission of evaluation committee reports of governmental activities or units designated for program evaluation.

February 4 ..... Senate and House bill introduction date. (Senate bills introduced after this date are referred to the Senate Rules Committee.) House bill introduction courtesy date.

February 25 ..... House bills introduced after this date are referred to the House Rules Committee. (They are not guaranteed public committee hearings.)

March 7 ..... Final date for introduction of bills without suspension of rules.

March 22 ..... Committee reporting courtesy date. (Each chamber's committees should report out its own bills by this date.)

March 28 ..... Opposite chamber bill crossover date. (Each chamber should send to the other chamber those bills it intends to pass favorably. Opposite chamber bills received after this date are subject to referral to the rules committee.)

April 4 ..... Budget bill to be passed by both chambers by this date.

April 11 ..... Adjournment.

May 11 ..... Final date for an extended session.

Post-session

May 1 ..... Final date for presentment of bills to the governor.

May 31 ..... Governor to sign/veto bills by this date.

June 1 ..... Other than emergency bills, earliest date for bills to take effect. Governor to sign/veto bills by this date.

July 1 ..... Budget, tax, and revenue bills to take effect.

October 1 ..... Usual effective date for bills.

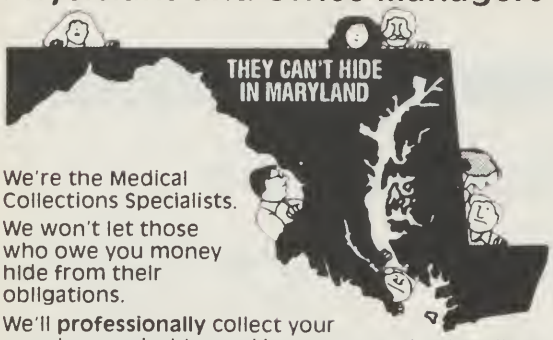
Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:



- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

From the Editor's Desk

David B. Doman, M.D.: Med Chi member runs for Congress

In order to assist Med Chi members in making informed decisions at the polls, especially with regard to health system reform legislation, the *MMJ* is scheduling meetings with various political candidates. On December 1, 1993, Editor Victor R. Hrehorovich, M.D., met with Med Chi member David B. Doman, M.D., of Montgomery County, who is seeking the Democratic nomination for Maryland's Eighth Congressional District. The following is the result of that interview.

Hrehorovich: Tell me about your medical background.

Doman: I received my M.D. in 1976 from Eastern Virginia Medical School in Norfolk, Virginia. I completed my internship and residency at the Yale Internal Medicine Program in Connecticut. I then proceeded with my gastroenterology fellowship at George Washington University School of Medicine, where I continue to serve as an associate clinical professor of medicine. In 1981, I established a successful gastroenterology practice in Montgomery County, subsequently bringing on two partners who are still with me.

Hrehorovich: Have you been involved with local and national medical societies?

Doman: I have been a member of the American Medical Association (AMA) and the American Medical Political Action Committee (AMPAC) for a number of years. I have also been active with my county component society and Med Chi. I served on the editorial board of *Montgomery Medicine*. I also served on the Montgomery County Medical Society Legislative Committee, and only recently resigned as chairperson due to the time demands of my political campaign. On a state level, I served as a Med Chi delegate for the last several years and as a board member of the Maryland Medical Political Action Committee (MMPAC).

Hrehorovich: How did you become interested in politics?

Doman: I've always been interested in politics and social activism. In the 1960s, the popular phrase was "If you're not part of the solution, you're part of the problem." That was something I believed deeply. My interest in civic activism and political activity was temporarily tabled during my medical education and postgraduate work, but I never lost the fire, and I never lost interest in addressing societal issues.

My interest has been reawakened by national health system reform. I feel a responsibility, as a citizen and a physician, to participate in the dialogue and help frame it.

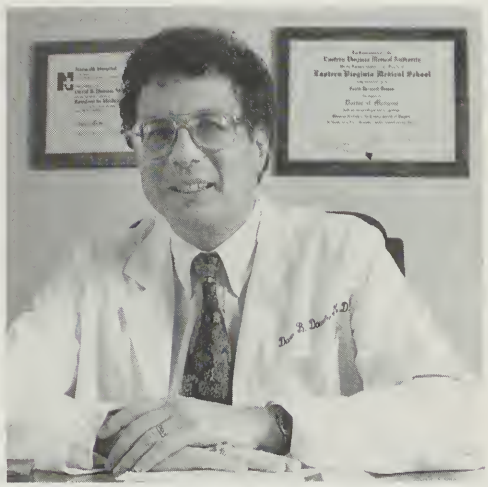

Figure 1. David B. Doman, M.D., in his medical office in Montgomery County.

Hrehorovich: Tell me about the office you are seeking, and why you have chosen to seek that office.

Doman: I am running for representative of the Eighth Congressional District in Montgomery County. I formally filed with the Federal Election Commission last August. I believe it's important to have physician participation in Congress. Currently, only 2 of the 535 members of Congress have a medical background. These two gentlemen are in their sixties and may not be seeking reelection. So, at a time when health system reform has become the nation's number one domestic issue, I believe strongly there should be at least one physician legislator.

Hrehorovich: In addition to health system reform, what other issues do you think are of great importance to the country at this time?

Doman: There are many. Certainly, the development of a policy establishing coordination between the government and the private industrial sector must be addressed. Historically, our society has been based on free market economics and capitalism. This certainly was appropriate when the free market entailed one company competing against another. Unfortunately, what has happened, particularly in the post–war era, is that free market economics, to a certain extent, are no longer valid. The playing field is no longer level when our private industries must compete against international government consortiums. The federal gov-

ernment should serve not as a partner with industry but as a facilitator to create an economic climate for research and development that will allow American industries to compete in the international arena.

Education, particularly when it comes to preserving our future, is another major issue. The data indicate our students are falling behind students in other industrialized nations in science, math, and technology. Ironically, our higher education system is still quite good; foreign students flock to our universities. Once the students have been educated however, they return overseas, and we are left with nothing except their tuition to show for it. American students are not currently pursuing, in large numbers, careers in science and technology. As a result, our nation has become a service-oriented society; much of the hard technology is being developed overseas in Europe and Asia. We need to ensure that our primary and secondary students are being properly educated, and that we have the educational infrastructure to provide for competitive American industries well into the 21st century.

Hrehorovich: Do you think it's possible that a single individual such as yourself could influence the course of health system reform?

Doman: If elected to Congress, I would view my role as far more significant than that of only one vote or of being a solitary junior member of Congress. As a physician, and certainly as a Democrat, I know I would be welcomed by a Democratic President and Congress. I believe I would be allowed to participate actively in all dialogue, and, I hope, provide suggestions and constructive criticism.

It is clear that the President and Congress have good intentions in trying to reform the health system, but, to a certain extent, they are presenting their legislative initiatives in a vacuum. As a welcomed member at the negotiating table, I could present the concerns and interests of physicians in private practice and, by extension, the concerns of patients.

Hrehorovich: What are your views on a national health care system? How would you construct it?

Doman: I'm very concerned about the way things are sorting out on Capitol Hill. Basically, two choices are evolving: (1) so-called managed competition and (2) the single-payer system. Our profession and certainly our patients must do everything possible to make sure the managed competition model works. If it doesn't, it will create a tremendous momentum to allow proponents of the single-payer government-run system to take over health care in this country.

Having reviewed health care systems in many industrialized nations—Canada, Britain, France, Italy, Germany—I am impressed that after all these years of social experimentation, these nations are belatedly discovering that there is a role for private insurance. This is ironic given the voices in this country calling for us to fall in line with these industrialized nations and to develop a single-payer government-run system.

I believe government has a responsibility to make sure all citizens have access to health care, but the government does not have the scientific background to implement that health care. This is where the medical community and people experienced in health care delivery systems should come into play. The government should step back and allow people with the experience, the knowledge, and the ethics, I might add, to provide health care for US citizens.

I am concerned with the aggressive government posture on health system reform. It could potentially compromise the sanctity of the doctor/patient relationship. One reason I am running for Congress is that I believe in order to practice medicine in the 1990s, doctors must be prepared to not only observe the Hippocratic oath but defend it as well. Whereas historically, doctors were not involved in politics, I believe we need to revise our vision of practicing medicine to encompass political activities. If we don't defend the Hippocratic oath, if we don't defend the sanctity of the doctor/patient relationship, no one else will.

Hrehorovich: The federal government thinks it needs to control health care costs because they are skyrocketing out of control in all realms—the pharmaceutical, the hospital, and the private physician. What do you think can be done to control this?

Doman: Viewing rising health care costs as reflecting doctor fees, hospital fees, and pharmaceutical fees is a simplistic and naive view of the problem. There is no question that health care costs are escalating at an unacceptable rate. A careful review will reveal that these escalating costs reflect American society—a society that is growing in population, and a population that is aging. Ironically, this is partly the result of the medical marvels and miracles provided to society by our profession. To some extent, we are being held accountable for the benefits we provide.

But the problem is much more than just a growing and aging population. Escalating health care costs, to a great extent, are caused by factors that could be eliminated or reduced—for example, smoking, alcohol abuse, and violence. Not many people realize that the leading cause of death among African-American teenage males in our society is gunshot wounds. Therefore, any comprehensive health system reform package must address safety in our communities. If law enforcement officials can restore safety

in our streets and reduce the number of individuals with knife and gunshot wounds who cascade into emergency rooms every day, there would be a dramatic and immediate reduction in the cost of health care in this country.

Finally, society is going to have to adjust its health care expectations. Some citizens think we should do everything for everyone—that there are bottomless pockets. Our society must make some difficult ethical decisions in which the medical community should participate. For example, society may have to reevaluate its position on providing health care, for the patient with a terminal illness or the patient who has been an alcoholic and is requesting a liver transplant. Perhaps in such extreme examples, we should emphasize the relief of pain and suffering rather than the cure. Instead of spending $250,000 to provide a liver transplant for an alcoholic, perhaps society would be better served by using the money to vaccinate thousands of poor babies. Realizing funds are limited, we have to adjust societal expectations and prioritize our health care decisions.

Hrehorovich: How soon do you think the country, under the leadership of the federal government, can effectuate societal changes to reduce smoking, drinking, and violence? Is this extensive change in behavior something that can be done in a short period of time?

Doman: Some things can be addressed in the short term, while others will have to be addressed in the long term. I strongly support a sin tax (i.e., the taxing of alcohol, specifically hard liquor, and tobacco). These taxes provide increased revenue in the short term, and are a means of behavior modification in the long term. If it is more expensive to engage in certain behaviors, such as cigarette smoking, individuals may cut back on smoking simply because they can't afford it. In the long term, that translates to reduced health care costs.

As for violence, the recent crime bill passed by Congress is a good start. Society and our leadership must realize that to reduce health care costs, there must be safety in our streets. Any comprehensive health system reform plan should include means to increase the presence of police in our communities, to increase the number of prisons, if necessary, and to decrease the number of knifings and gunshot wounds.

Hrehorovich: What do you believe the medical community can do to help at the national level and, specifically, in your own campaign for national office?

Doman: It's important that the physician community awaken from its political slumber and participate in the process; if it doesn't, change will proceed without physician input. We have a responsibility to actively participate as patient advocates. Legislators, given that they have no medical background, will do what they are trained to do, which is look at charts, graphs, and numbers and focus strictly on the bottom line without appreciating how it translates into real people and real patient care. Unfortunately, once the health system reform initiative is passed, legislators will turn to doctors and say, "Here you go. Now go practice medicine under these guidelines." It will be much easier if physicians help craft the legislation rather than react after it has been passed.

As for what can be done to assist me, there are already hundreds of physicians who have volunteered and contributed to my campaign. The health care issues I am advocating are not specific to physicians in Montgomery County; they are applicable to physicians throughout Maryland. These are bipartisan, not Republican or Democratic, issues. Therefore, I am seeking broad-based support from the physician community throughout Maryland. It is important that physicians participate in the political process on behalf of the medical profession and, by extension, the patients they have taken an oath to serve.

Hrehorovich: Do you see problems in the health care system that physicians could help correct—on the hospital level, the pharmaceutical level, or the individual physician practice level?

Doman: We have a responsibility to improve regulations in the physician community. But, regulation should come from within our profession not from an outside bureaucratic agency. I say this because governmental agencies often view issues out of context. Efforts to improve regulation have already been made at the state and national level, and they should continue. All regulation should be done on a peer level within the physician community.

Hrehorovich: What is your view on health care industries—hospitals and insurance companies—that obtain benefits from society by having a tax-exempt or nonprofit status? What do you think their responsibility is versus the responsibility of the for-profit entities?

Doman: Those that have favored status as tax-exempt entities have a legal and ethical responsibility to adhere to the letter of the law. Those entities that deviate from the law by making for-profit or inappropriate investments need to be closely regulated.

I was troubled, as was most of the public, about the recent revelations regarding Blue Cross and Blue Shield of Maryland, and Blue Cross and Blue Shield of the National Capital Area, in terms of their non–health care investments and their expenditures on entertainment—whether it was a sky box at Camden Yards or a trip to the Winter Olympics for dozens of executives and their significant others. These

costs were passed on to policyholders under the guise of the rising cost of health care. In turn, people got the impression that the costs were doctor fees.

As an elected congressman, I would work for greater regulation of the insurance industry. I still strongly believe that private insurance is the best way to provide health care, but the medical profession and the government must make sure that these industries are regulated and that expenditures are keyed directly to health care costs and are not used for extraneous business ventures or entertainment expenses.

Hrehorovich: What are your thoughts about the salaries being paid to the chief executive officers (CEOs) of the insurance companies?

Doman: I was shocked and dismayed about some recent congressional revelations regarding benefit packages received by insurance company CEOs. At a time when insurance companies are publicly preaching health care cost containment, I think it is inappropriate that their CEOs are receiving high six-figure or even seven-figure benefit packages. It seems to be a possible conflict of interest when an insurance company is able to potentially increase premiums, reduce physician compensation, reduce services provided for patients, and increase bottom-line profits. In some cases, these profits are translated into executive bonuses for insurance company executive officers. As a member of Congress, it would be my hope to improve regulation of insurance companies to make sure that they do not receive windfall profits and unreasonably high benefit packages at a time when the overriding concern is health system reform.

Hrehorovich: Do you believe that nonprofit hospitals should be similarly regulated to maintain their commitment to patient care?

Doman: I think there is a greater need to make sure they are regulated appropriately. If they receive favored status, they should not be allowed to use monies that are indirectly provided through public funding on for-profit ventures.

Hrehorovich: You are a Democrat. How do you respond to being in a party that is frequently accused of being the tax-and-spend party?

Doman: I wince when I hear that term. I believe there are two ways to raise funds to balance the budget. The one to which I am very much opposed—not only philosophically but personally as a tax-paying citizen—is raising income taxes.

I believe the way to increase revenue is by developing a policy establishing coordination between government and private industry that will allow for economic development and job growth, thereby reducing unemployment. By reducing unemployment, we can increase revenue by broadening the tax base. This will also reduce expenditures by removing people from social subsidies.

I also believe the Democratic party is coming to realize that social subsidies will have to be looked at closely as we try to balance the budget. I believe, in retrospect, that the War on Poverty in the 1960s was a well-intended social intervention that failed. It failed because social subsidy recipients had no way to escape the vicious cycle in which they found themselves.

We should take the hard-learned lessons of the 1960s and apply them to the 1990s. We need to make sure that social subsidies are not viewed as a way of life, but rather as a second chance—a safety net provided by the government for people having a difficult time. Recipients need to understand that it is a two-way contract with mutual responsibilities. While receiving subsidies, which I believe should be limited to a two-year period, recipients should be required to seek employment or attend a job retraining program to receive the skills they need to acquire employment. If the recipients are parents, I would advocate that their children attend school at least 90% of the time and receive all required vaccinations. This way, we can encourage social subsidy recipients to be good parents. In the long term, if their children are required to attend school 90% of the time, data indicate that these educated children will be less likely to get involved in crime and are, therefore, more likely to seek gainful employment in the future. If we can do that within one generation, we can break the vicious cycle of social subsidies in our nation.

Hrehorovich: What about those individuals who have looked for jobs and can't find them, who have sincerely made an effort to obtain employment, and have even engaged in retraining? Because of our changing economy, and because many entry-level jobs and less skilled jobs are going to labor markets abroad, what would you tell individuals who say,"I've looked for two years. I can't find a job."

Doman: That, unfortunately, is a reflection of changing international economics. What that means is that the government has a responsibility to develop an industrial policy establishing coordination between government and private industry. The result would be the ability to project where the job growth will be in the coming decade, anticipate the needs, and educate the work force to be prepared for these changes. For people who cannot find work, the government could provide temporary work programs. (For example, in the 1930s, President Roosevelt had public work projects designed to get people off the welfare rolls and back to work.) Once people are on their

feet and can continue their job education programs, they may be able to break the vicious cycle and find gainful employment.

There is a lot in our nation's infrastructure that needs to be looked at, whether it is our educational system, our rail system (which is terribly behind the times), or our highway system. We can't just respond to economic conditions in the 1990s, but must try to define them in the international arena. One reason our nation flourished early in this century was that we created new markets and new industries—aerospace, computers, electronics, automotives. The challenge for our nation in the 21st century will be to establish innovative new markets and industries, thus creating additional jobs for our citizens.

Hrehorovich: Some people say that government regulations interfere with productivity and economic growth. Businesses certainly complain about a lot of regulations. Of all professions, medicine seems to be the most regulated. What are your views on government regulation?

Doman: The trouble with government regulation in 1993 is that it impairs economic development and, by extension, job growth. We need to create a coordinated government/private-industry industrial policy for short and long-term economic development. We need to change the relationship between government and private industry from a punitive regulatory one to one in which government turns to private industry and says, "What can we do to facilitate economic research and development, open up new types of industries, open up new markets and, therefore, sustain job growth in our nation?" We need productive dialogue between government and industry so that our government can create an environment in which new industries for the 21st century can be developed.

Similarly, medical regulation needs to be redefined. I believe the government does have a responsibility to make sure all citizens have access to quality health care, and it has the responsibility to make sure benefits are provided. But, how to go about delivering health care and providing benefits should be decided by the entities and individuals qualified to do that—private insurance companies and physicians. The government should regulate insurance companies but should not try to deliver health care. Similarly, the government should ask the physician community what can be done to reduce bureaucracy and the hassle factor and get physicians away from paper work and back to the bedside where they belong in order to provide high quality health care for patients.

Hrehorovich: What are your thoughts about attempts to place fee caps on physician services?

Doman: I believe anyone who tries to place caps on physician fees does not have a grasp of what is causing health care costs to increase. Indeed, recent attempts to establish "physician fee schedules" demonstrated that health care costs will continue to climb. A vivid example of this is Medicare; most physicians participate in this program, which has a health care fee schedule. Yet, Medicare costs continue to escalate rapidly.

Rather than placing limits on physician fees, the emphasis of health system reform should be to determine the root causes of the increasing health care costs. Refocused attention should be paid to a population that is growing in size and is aging; the public's expectations for unlimited testing and therapy, regardless of the potential outcome; and, of course, the societal health care consequences of smoking, alcohol abuse, drug abuse, and violence. Rather than limiting physician fees, attempts should be made to eliminate the need for some of these health care services which, in turn, would lead to an immediate and dramatic reduction in the cost of health care.

Hrehorovich: How have you prepared yourself for political office, and have you had any experience with governmental agencies on health care issues?

Doman: I have been active with the Democratic party on a national and county level for a number of years. During the last election cycle, I was a key advisor to Congressman Albert Wynn, who was successfully elected to Maryland's 4th Congressional District in Prince George's County. I specifically advised Congressman Wynn on health care issues. In addition, Neal Potter, the Montgomery County chief executive, appointed me to the Montgomery County Commission on Aging last year. In this capacity, I have become particularly concerned about health care and other societal issues facing our senior citizen population.

Hrehorovich: How have you prepared for your campaign?

Doman: In the past year, I attended an intensive one-week campaign-management school where I put in 16- to 18-hour days. I have also retained the highly regarded Campaign Design Group to coordinate my campaign. Having attended extensive didactic lectures and having met with dozens of political consultants, I now have the contacts and knowledge to run a sophisticated and competitive political campaign.

Hrehorovich: What sort of support and endorsement have you received so far?

Doman: I'm very proud that in just a few months I have received support from the Maryland Medical Political Action Committee (MMPAC) and the District of Columbia

Political Action Committee. I have also received endorsements from the Board of Directors of the Montgomery County Medical Society and the Board of Directors of the Prince George's County Medical Society. It is very important to my campaign that I receive broad-based bipartisan physician support because the issues for which I am advocating are relevant to physicians throughout Maryland.

Hrehorovich: How do you view your chances of being elected?

Doman: Anytime you face off against an incumbent, it's a great challenge. Nonetheless, the public should respond positively to a nonpolitician with a medical background at a time when health system reform is becoming the nation's number one domestic issue. In addition, the district in which I am running, Montgomery County, is 54% Democratic, 35% Republican, and 11% independent; therefore, to win the Democratic nomination with such a heavily Democratic constituency has great value. I think I have a very good chance. To take a page from the Bible, I think this David will do very well against the governmental Goliath.

Hrehorovich: You have been endorsed by several physician groups. Have you been endorsed by any nonphysician groups?

Doman: I have already had extensive meetings with the leadership of the Montgomery County Democratic Party. They are not only aware of what I'm doing, but very supportive. I have also initiated meetings with members of organized labor, educational groups, and private industry. These groups are also supportive of the ideas I would be bringing to the legislative arena.

Hrehorovich: What is the likelihood that you will be the Democratic nominee?

Doman: Very good. At this point, I am unopposed for the nomination, and there is no one even remotely on the horizon. The Democratic leadership, precinct officials, and elected officials are rapidly joining to support me. The Democratic primary is in September 1994. As things stand now, God willing, I will win the nomination. I would then run in the general election in November 1994.

Hrehorovich: How will your campaign and possible election affect your practice and your family?

Doman: I have been married for 18 years and have a wonderful wife, Peggy, and three beautiful children, Mark (age 15), Sandy (age 12), and Melissa (age 8). Prior to announcing my candidacy, I had an extensive heart-to-heart talk with my family. They were understanding and shared in my desire to make a meaningful contribution to society on issues of health care, education, and our nation's future economic development. If elected, there will be intrusions on my personal life; however, these will be no different than those experienced by most physicians and their families each and every day.

As for my practice, I am blessed with two terrific partners who are very supportive of what I am doing. Though we would hate to part professionally, they understand I have a greater responsibility to our patients and our nation Nonetheless, I would always consider myself a physician and would view everything from the view of a practicing physician; that is the essence of what I am. I would continue to serve as a physician through part-time clinical and teaching activities.

Hrehorovich: How can someone reach you to discuss issues or concerns?

Doman: People can write to Doman for Congress, Campaign Headquarters, 3720 Farragut Avenue, 4th Floor, Kensington, MD 20895, or call 301-949-955 or 800-VOTE-DBD. ■ *VS*

Upcoming issues of the *MMJ* will feature other candidates for political office. Inclusion of interviews with political candidates does not necessarily indicate support or endorsement. Any candidate wishing to be considered for an interview by the *MMJ* should contact the journal office at 410-539-0872 or 800-492-1056.

MARYLAND RESIDENTS:
TWO WAYS TO EARN TRIPLE-TAX-FREE INCOME

100% NO LOAD

T. ROWE PRICE MARYLAND TAX-FREE FUNDS—TWO TAX-SAVING STRATEGIES

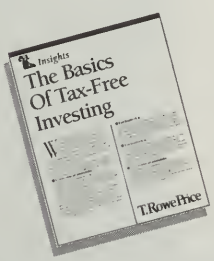
As a Maryland resident, you could be losing over 41% of your earnings to income taxes. T. Rowe Price, the leader in Maryland tax-free investing, can help. We offer *two* Maryland funds whose earnings are *exempt from federal, state, and local taxes*—the income is *triple-tax-free*, so you keep everything you earn.* And, because tax-free yields are currently attractive versus comparable taxable yields, your income can be higher with tax-free funds, as the chart shows.

Your earnings can be higher with tax-frees

Annual income on an investment of $20,000 if you're in the 36% federal tax bracket, or 41.8% bracket including state and local taxes

	What you earn		What you pay in federal, state, and local taxes		What you keep
Typical long-term bond fund					
Taxable fund	$1,040	–	$435	=	**$605**
Tax-free fund	$886	–	$0	=	**$886**
Typical short-term bond fund					
Taxable fund	$872	–	$364	=	**$508**
Tax-free fund	$688	–	$0	=	**$688**

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.*



Two no-load Funds let you choose your approach.

Whether you want to minimize risk or maximize potential returns, T. Rowe Price has a Fund to suit your needs.

Maryland Short-Term Tax-Free Bond Fund is the *only* Maryland fund to give you the minimal risk of short-term tax-free bonds. With an average portfolio maturity of 1–3 years, it can be appropriate for those who prefer a more cautious investment approach. The Fund offers less risk and lower returns than a longer-term fund.

Maryland Tax-Free Bond Fund—*Maryland's largest tax-free fund*—offers greater income potential, with greater price volatility than our short-term fund. It invests in long-term Maryland securities and has an average portfolio maturity greater than 10 years. Of course, these are both bond funds, so yields and share prices will vary as interest rates change.

Our free report can help you make an informed decision. *The Basics Of Tax-Free Investing* can help you develop a tax-free strategy to meet your investment goals. Each Fund has a $2,500 minimum, offers free checkwriting, and has **no sales charges.**

Durable medical equipment

Effective January 1, 1994, durable medical equipment (DME) claims must be forwarded to AdminaStar Federal, Inc. For information, call

- Provider Education, 317-841-4486
- Customer Service, 800-346-2233
- EMC Customer Service, 800-237-6318
- EMC Enrollment Information, 800-952-2068
- Telephone Appeals, 317-841-1307

Physicians may also write to

AdminaStar Federal, Inc.
PO Box 7078
Indianapolis, IN 46207-7078

The 11 new forms for DME supplies follow this article: (1) hospital beds/support surfaces, (2) manual/motorized wheelchairs, (3) respiratory equipment, (4) orthotics/lymphedema pumps/osteogenesis stimulators/therapeutic shoes, (5) surgical dressings/urological supplies, (6) TENS (transcutaneous electrical nerve stimulation), (7) seat-lift mechanisms/power-operated vehicles, (8) immunosuppressive drugs, (9) infusion pumps/home glucose monitors, (10) parental or enteral nutrition, and (11) home oxygen therapy.

AdminaStar Federal supplied the following questions and answers about DME usage.

▲What is a physician's responsibility when prescribing DME?

Regulations specify that DME must serve a medically therapeutic benefit to be reimbursed. The physician's prescription is the primary source of this information. The physician is responsible for supplying a complete, detailed, and accurate description of the patient's condition.

Section 4152 of OBRA '90 (Omnibus Budget Reconciliation Act) prohibits suppliers from distributing to physicians or beneficiaries any completed or partially completed Medicare-required forms or other documents showing that a covered item is medically necessary. Any supplier of covered DME or related supplies who knowingly and willfully violates this provision is subject to a civil monetary penalty not to exceed $1,000 for each such form or document completed and distributed.

Claims for DME home use and related supplies can be paid only if the items meet the Medicare definition of covered DME and are found to be medically necessary. The determination of medical necessity is made using documentation written by the beneficiary's physician.

▲What are physician requirements for completing a certificate of medical necessity (CMN)?

The physician is responsible for completing the medical documentation supporting the DME claim. Physician completion of the required medical documentation assures that the furnished DME items are specifically needed for the beneficiary's unique medical condition. Documentation may consist of medical records, plans of care, discharge plans, prescriptions, or forms explicitly designed to document medical necessity. Regardless of the format, the physician's documentation must establish that the DME is medically necessary for that particular patient and that coverage criteria are met. In addition, the documentation must

- be signed by the physician in his/her own hand and be dated;
- include the diagnosis (ICD-9) or condition that is necessitating the item;
- include a realistic estimate of the length of time the equipment will be needed;
- include the physician's name, UPIN (unique physician identification number), address, and telephone number; and
- provide substantiating medical information communicating the need for DME. This can include the patient's general condition, a clinical assessment of the factors that the physician believes support the DME items being ordered, or a treatment plan for the specific condition requiring the item.

The DME supplier may (1) complete only the administrative portions of the form or other comparable documentation (the beneficiary's name; address; HICN [health insurance claim number]; the supplier's identifying information; and the physician's name, address, and telephone number) or (2) enclose a cover letter to the physician giving a description of the patient's need and a complete narrative description of the specific equipment contemplated (the actual charge should be included as part of, or in addition to, the narrative description).

Physicians may not charge suppliers or beneficiaries for completing DME certification and recertification forms. The Office of Investigations considers the soliciting of such fees as a potential felony. Allegations against physicians charging suppliers or beneficiaries for completing CMNs should be reported to

DMERC Fraud and Abuse Unit
PO Box 6128
Indianapolis, IN 46206-6128

▲ Audit of CMNs, prior authorization, and prescription requirements

The DMERC (DME Regional Carrier) Fraud and Abuse Unit will be conducting random audits of all CMNs submitted to the DMERC (approved and denied CMNs, both electronic media claims (EMC) and hard copies). The audits' purpose is to ensure that there are hard copy CMNs to support electronically submitted CMNs and to determine whether

- a supplier completed any part of the medical necessity justification before or after the physician completed the justification;
- the recipient of the equipment or supplies was charged and paid a deductible and copayment;
- the recipient initiated the request for the item(s) or was approached by the supplier;
- the diagnosis and other statements in the CMN or prior authorization are consistent with the medical records;
- the equipment or supplies billed were actually received by the beneficiaries; and,
- the items were received as billed.

To determine the medical necessity of the items billed, the DMERC Fraud and Abuse Unit will be requesting medical records from the prescribing physician. Upon receipt of a request for documentation, the prescribing physician should forward to the DMERC Fraud and Abuse Unit the required medical documentation assuring that the DME items furnished to a beneficiary are those specifically needed for the beneficiary's medical condition (e.g., medical records, plans of care, discharge plans, prescriptions, or forms explicitly designed to facilitate the documentation of medical necessity). A completed CMN copy, by itself, would not provide sufficient documentation of medical necessity. ■

[ ] 13. Are you supervising the use of the device?

[ ] 14. Does the patient have coexisting pulmonary disease?

[ ] 15. Has a conservative treatment program been tried without success?

[ ] 16. Was a comprehensive assessment performed after failure of conservative treatment?

[ ] 17. Is the home electric system sufficient for the anticipated increase in energy consumption?

[ ] 18. Is structural support adequate to support the air-fluidized bed?

[ ] 19. Are open, moist dressings used for the treatment of the patient?

[ ] 20. Is there a trained fulltime caregiver to assist the patient and manage all aspects involved with the use of the bed?

21. Provide the stage and size of each pressure area/ulcer necessitating the use of the overlay, mattress or bed.

Pressure area/Ulcer	#1	#2	#3
Stage:	____	____	____
Max Length (cm):	____	____	____
Max Width (cm):	____	____	____

___ 22. Over the past month, the patient's ulcer(s) has/have:

1) improved 2) remained the same 3) worsened

I certify the medical necessity of these items for this patient. Section B of this form and any statement on my letterhead attached hereto has been completed by me, or by my employee and reviewed by me. The foregoing information is true, accurate, and complete, and I understand that any falsification, omission, or concealment of material fact may subject me to civil or criminal liability.

PHYSICIAN NAME, ADDRESS	_____ __/__/__ PHYSICIAN'S SIGNATURE: DATE (A STAMPED SIGNATURE IS NOT ACCEPTABLE) ☐ Attending ☐ Consulting ☐ Other ordering UPIN:_____ TELEPHONE #: (___) ____-____

08/16/93

SECTION A: (To be completed by the supplier)

CERTIFICATION TYPE:	Check the appropriate box to indicate if this CMN is the initial certification for this patient or if this is a revised certification.
BENEFICIARY INFORMATION:	Indicate the beneficiary's name, permanent legal address, telephone number and his/her health insurance claim number (HICN) as it appears on the beneficiary's Medicare card and on your claim form.
PLACE OF SERVICE:	Indicate the place in which the item is being used, i.e., patient's home is 12, skilled nursing facility (SNF) is 31, End Stage Renal Disease (ESRD) facility is 65, etc. Refer to your supplier manual for a complete index.
REPLACEMENT:	If the item billed is a replacement for a previously purchased item, place a check mark in the blank.
FACILITY NAME:	If the place of service is a facility, indicate the name and complete address of the facility.
SUPPLIER INFORMATION:	Indicate the name of your company (supplier name), address and telephone number along with the Medicare Supplier Number assigned to you by the National Supplier Clearinghouse (NSC).
HCPCS CODES:	List all procedure codes for items ordered that require a CMN. Procedure codes that do not require a certification should not be listed on the CMN. If the item ordered is purchased equipment, indicate whether the equipment is covered by a warranty. "Y" denotes that there is a warranty and "N" indicates there is no warranty. If it is covered by a warranty, the length and type of warranty must be indicated.

SECTION B: (To be completed by the physician or physician's employee)

DIAGNOSIS:	In the first space, list the ICD9 code that represents the primary reason for ordering this item. List any additional ICD9 codes that would further describe the medical need for the item (up to 3).
EXAMINATION DATE:	Indicate the date (MM/DD/YY) the patient was last seen by the ordering physician prior to the beginning of this certification period.
DOB:	Indicate patient's date of birth (MM/DD/YY).
DATE NEEDED:	Indicate the date (MM/DD/YY) the ordered item was initially needed outside the hospital setting. If this certification is a revised certification, also indicate the effective date of the order change.
EST. LENGTH OF NEED:	Indicate the estimated length of need (the length of time the physician expects the patient to require use of the ordered item) by filling in the appropriate number of months. If the physician expects that the patient will require the item for the duration of his/her life, then enter 99.
QUESTION SECTION:	This section is used to gather clinical information to determine medical necessity. Answer each question within the category of the items ordered, using "Y" for yes, "N" for no, and "D" for does not apply, unless otherwise noted.
PHYSICIAN INFORMATION:	The physician's signature certifies that the item ordered is medically necessary for this patient and that section B was completed or reviewed by the physician. This form must be signed and dated by the physician. Signature and date stamps are not acceptable. The physician must indicate whether he/she is the attending, consulting or other ordering physician by putting a check mark in the appropriate box. Indicate other ordering when you are neither the attending or consulting physician. Refer to your supplier manual for more information.
PHYSICIAN NAME, ADDRESS:	Indicate physician's name and complete mailing address.
UPIN:	The physician must indicate his/her Unique Physician Identification Number (UPIN).
PHYSICIAN'S TELEPHONE NO:	The physician must give a telephone number where he/she can be contacted (preferably a number where records would be accessible pertaining to this patient) if more information is needed.

ANSWER QUESTIONS 1-6 FOR RENTAL OF TENS, AND 3-12 FOR PURCHASE OF TENS **Use Y - Yes, N - No or D for Does Not Apply unless otherwise noted.**

[ ] 1. Does the patient have acute post-operative pain?

2. What is the date of the surgery resulting in acute post-operative pain?
_____/_____/_____

[ ] 3. Does the patient have chronic, intractable pain?

___ 4. How long has the patient had intractable pain?
Enter number of months 1-99.

___ 5. For which, if any, of the following conditions is the TENS unit being prescribed?
1 - Headache
2 - Visceral abdominal pain
3 - Pelvic pain
4 - Temporomandibular joint (TMJ) pain
5 - None of the above

[ ] 6. Is there documentation in the medical record of multiple medications and/or other therapies that have been tried and failed?

[ ] 7. Has the patient received a TENS trial?

8. What are the dates that trial of TENS unit began and ended?
_____/_____/_____ to _____/_____/_____

9. What is the date that you reevaluated the patient at the end of the trial period?
_____/_____/_____

___ 10. How often has the patient been using the TENS?
1 = Daily
2 = 3 to 6 days per week
3 = 2 or less days per week

[ ] 11. Do you and the patient agree that there has been a significant improvement in the pain and that long term use of a TENS is warranted?

___ 12. Number of TENS leads (i.e., separate electrodes) routinely needed and used by the patient at any one time:
2 = 2 Leads
4 = 4 Leads

I certify the medical necessity of these items for this patient. Section B of this form and any statement on my letterhead attached hereto has been completed by me, or by my employee and reviewed by me. The foregoing information is true, accurate, and complete, and I understand that any falsification, omission, or concealment of material fact may subject me to civil or criminal liability.

PHYSICIAN NAME, ADDRESS	_____ __/__/__ PHYSICIAN'S SIGNATURE: DATE (A STAMPED SIGNATURE IS NOT ACCEPTABLE) ☐ Attending ☐ Consulting ☐ Other ordering UPIN:_____ TELEPHONE #: (___) ___-____

08/16/93

SECTION A: (To be completed by the supplier)

CERTIFICATION TYPE:	Check the appropriate box to indicate if this CMN is the initial certification for this patient or if this is a revised certification.
BENEFICIARY INFORMATION:	Indicate the beneficiary's name, permanent legal address, telephone number and his/her health insurance claim number (HICN) as it appears on the beneficiary's Medicare card and on your claim form.
PLACE OF SERVICE:	Indicate the place in which the item is being used, i.e., patient's home is 12, skilled nursing facility (SNF) is 31, End Stage Renal Disease (ESRD) facility is 65, etc. Refer to your supplier manual for a complete index.
REPLACEMENT:	If the item billed is a replacement for a previously purchased item, place a check mark in the blank.
FACILITY NAME:	If the place of service is a facility, indicate the name and complete address of the facility.
SUPPLIER INFORMATION:	Indicate the name of your company (supplier name), address and telephone number along with the Medicare Supplier Number assigned to you by the National Supplier Clearinghouse (NSC).
HCPCS CODES:	List all procedure codes for items ordered that require a CMN. Procedure codes that do not require a certification should not be listed on the CMN. If the item ordered is purchased equipment, indicate whether the equipment is covered by a warranty. "Y" denotes that there is a warranty and "N" indicates there is no warranty. If it is covered by a warranty, the length and type of warranty must be indicated.

SECTION B: (To be completed by the physician or physician's employee)

DIAGNOSIS:	In the first space, list the ICD9 code that represents the primary reason for ordering this item. List any additional ICD9 codes that would further describe the medical need for the item (up to 3).
EXAMINATION DATE:	Indicate the date (MM/DD/YY) the patient was last seen by the ordering physician prior to the beginning of this certification period.
DOB:	Indicate patient's date of birth (MM/DD/YY).
DATE NEEDED:	Indicate the date (MM/DD/YY) the ordered item was initially needed outside the hospital setting. If this certification is a revised certification, also indicate the effective date of the order change.
EST. LENGTH OF NEED:	Indicate the estimated length of need (the length of time the physician expects the patient to require use of the ordered item) by filling in the appropriate number of months. If the physician expects that the patient will require the item for the duration of his/her life, then enter 99.
QUESTION SECTION:	This section is used to gather clinical information to determine medical necessity. Answer each question within the category of the items ordered, using "Y" for yes, "N" for no, and "D" for does not apply, unless otherwise noted.
PHYSICIAN INFORMATION:	The physician's signature certifies that the item ordered is medically necessary for this patient and that section B was completed or reviewed by the physician. This form must be signed and dated by the physician. Signature and date stamps are not acceptable. The physician must indicate whether he/she is the attending, consulting or other ordering physician by putting a check mark in the appropriate box. Indicate other ordering when you are neither the attending or consulting physician. Refer to your supplier manual for more information.
PHYSICIAN NAME, ADDRESS:	Indicate physician's name and complete mailing address.
UPIN:	The physician must indicate his/her Unique Physician Identification Number (UPIN).
PHYSICIAN'S TELEPHONE NO:	The physician must give a telephone number where he/she can be contacted (preferably a number where records would be accessible pertaining to this patient) if more information is needed.

EST. LENGTH OF NEED: # OF MONTHS: ____ 1-99 (99 = LIFETIME)

ANSWER QUESTIONS 1-5 FOR SEAT LIFT MECHANISMS, ANSWER QUESTIONS 6-14 FOR POWER OPERATED VEHICLES (POV)
Use Y - Yes, N - No or D for Does Not Apply unless otherwise noted.

SEAT LIFT MECHANISM

[ ] 1. Does the patient have severe arthritis of the hip or knee?

[ ] 2. Does the patient have a severe neuromuscular disease?

[ ] 3. Is the patient completely incapable of standing up from a regular armchair or any chair in his/her home?

[ ] 4. Once standing, does the patient have the ability to ambulate?

[ ] 5. Have all appropriate therapeutic modalities to enable the patient to transfer from a chair to a standing position (e.g., medication, physical therapy) been tried and failed? If YES, this is documented in the patient's records.

POWER OPERATED VEHICLE

[ ] 6. Would the patient be bed or chair confined without the use of a wheelchair?

[ ] 7. Is the patient unable to operate a manual wheelchair?

[ ] 8. Can the patient ambulate in the home but the POV is required for movement outside the home?

[ ] 9. Is the patient capable of safely transferring in and out of the POV?

[ ] 10. Is the patient capable of safely operating the controls of the POV?

[ ] 11. Does the patient have adequate trunk stability to be able to safely ride in the POV?

[ ] 12. Are you a specialist in physical medicine, orthopedic surgery, neurology, or rheumatology?

[ ] 13. Is the patient more than one day's roundtrip from a specialist in physical medicine, orthopedic surgery, neurology, or rheumatology?

[ ] 14. Does the patient's condition preclude a visit to a specialist in physical medicine, orthopedic surgery, neurology, or rheumatology?

I certify the medical necessity of these items for this patient. EXAMINATION DATE:	Indicate the date (MM/DD/YY) the patient was last seen by the ordering physician prior to the beginning of this certification period.
PT. HT., PT. WT., DOB:	Indicate the patient's height in inches and weight in pounds. Indicate patient's date of birth (MM/DD/YY).
DATE NEEDED:	Indicate the date (MM/DD/YY) the ordered item was initially needed outside the hospital setting. If this certification is a revised certification, also indicate the effective date of the order change.
EST. LENGTH OF NEED:	Indicate the estimated length of need (the length of time the physician expects the patient to require use of the ordered item) by filling in the appropriate number of months. If the physician expects that the patient will require the item for the duration of his/her life, then enter 99.
QUESTION SECTION:	This section is used to gather clinical information to determine medical necessity. Answer each question within the category for the items ordered, using "Y" for yes, "N" for no, and "D" for does not apply, unless otherwise noted.
PHYSICIAN INFORMATION:	The physician's signature certifies that the item ordered is medically necessary for this patient and that section B was completed or reviewed by the physician. This form must be signed and dated by the physician. Signature and date stamps are not acceptable. The physician must indicate whether he/she is the attending, consulting or other ordering physician by putting a check mark in the appropriate box. Indicate other ordering when you are neither the attending or consulting physician. Refer to your supplier manual for more information.
PHYSICIAN NAME, ADDRESS:	Indicate physician's name and complete mailing address.
UPIN:	The physician must indicate his/her Unique Physician Identification Number (UPIN).
PHYSICIAN'S TELEPHONE NO:	The physician must give a telephone number where he/she can be contacted (preferably a number where records would be accessible pertaining to this patient) if more information is needed.

ATTENDING PHYSICIAN'S CERTIFICATION OF MEDICAL NECESSITY FOR HOME OXYGEN THERAPY *(Legible handwritten entries acceptable)*

Public reporting burden for this collection of information is estimated to average 15 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to HCFA, P.O. Box 26684, Baltimore, MD 21207; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503.

Patient's Name, Address, and HIC No.	Supplier's Name, Address, and Identification No.

Certification: ☐ Initial ☐ Revised ☐ Renewed

INFORMATION BELOW TO BE ENTERED ONLY BY PHYSICIAN OR PHYSICIAN'S EMPLOYEE

1. Pertinent Diagnoses, ICD-9-CM Codes, and Findings - CHECK ALL THAT APPLY:

☐ Emphysema (492.8)
☐ COPD (496)
☐ Cor Pulmonale (416.9)
☐ Interstitial Disease (515)
☐ Other _____ (Specify) _____ (Code)
☐ Chronic Obstructive Bronchitis (491.2)
☐ Chronic Obstructive Asthma (493.20)
☐ Congestive Heart Failure (428.0)
☐ Secondary Polycythemia (289.0)
☐ Hematocrit 57% or more Yes☐ No☐

2.A. I last examined this patient for this condition on:
_____/_____/_____
Month Day Year

2.B. Home oxygen prescribed:
_____/_____/_____
Month Day Year

2.C. Estimated length of need:
☐1-3 months ☐4-12 months ☐ Lifetime

3.A. Results of Most Recent Arterial Blood Gas and/or Oxygen Saturation Tests (Patient Breathing Room Air)

	PO2	02 Saturation	Date
(1) At Rest			
(2) Walking			
(2) Sleeping			
(3) Exercising			
(4) Other :			

3.C. Physician/Provider Performing Test(s) *(Printed/Typed Name and Address)*:

3.B. If performed under conditions other than room air, explain:

NOTE: If PO2 Level exceeds 59 mm Hg or the arterial blood saturation exceeds 89% at rest on room air, the claim will be disallowed without compelling medical evidence. Check block ☐ if you have attached a separate statement on your letterhead of additional documentation.

4. Oxygen Flow Rate : _____ Liters per minute ☐ Continuous (24 hrs/day)

☐ Noncontinuous (Enter hrs/day): _____ Walking _____ Sleeping _____ Exercise Program _____ Other (specify) _____

5. Oxygen Equipment Prescribed If you have prescribed a particular form of delivery, check applicable block(s). Otherwise leave blank.

A. Supply System

(1) Stationary Source ☐ Concentrator ☐ Liquid Oxygen ☐ Compressed Gas ☐ Other

(2) Portable or Ambulatory Source ☐ Liquid Oxygen ☐ Compressed Gas ☐ Other _____

B. Delivery System

☐ (1) Nasal Cannula
☐ (2) 02 Conserving Device
☐ Pulse 02 System
☐ Reservoir System
☐ Other _____
☐ (3) Transtracheal Catheter
☐ (4) Other _____

6. If you have prescribed a portable or ambulatory system, describe activities/exercise that patient regularly pursues which require this system in the home and which cannot be met by a stationary system (e.g., amount and frequency of ambulation).

CERTIFICATION

THE PATIENT HAS APPROPRIATELY TRIED OTHER TREATMENT MEASURES WITHOUT SUCCESS. OXYGEN THERAPY AND OXYGEN EQUIPMENT AS PRESCRIBED IS MEDICALLY INDICATED AND IS REASONABLE AND NECESSARY FOR THE TREATMENT OF THIS PATIENT. THIS FORM AND ANY STATEMENT ON MY LETTERHEAD ATTACHED HERETO HAS BEEN COMPLETED BY ME, OR BY MY EMPLOYEE AND REVIEWED BY ME. THE FOREGOING INFORMATION IS TRUE, ACCURATE, AND COMPLETE, AND I UNDERSTAND THAT ANY FALSIFICATION, OMISSION, OR CONCEALMENT OF MATERIAL FACT MAY SUBJECT ME TO CIVIL OR CRIMINAL LIABILITY.

Form HCFA-484 (5-90)

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found In Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

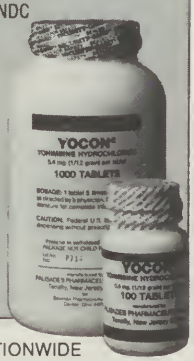
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/ Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

To volunteer or for more details, call Med Chi's Public Relations Department at 410-539-0872 1-800-492-1056.

Doctor/Lawyer/Teacher Partnership Against Drugs

Should the Auxiliary become the Alliance?

As the gavel closed the 1993 AMAA (American Medical Association Auxiliary) House of Delegates meeting in Chicago on June 15, a new era began in the life of the 70-year-old organization. "Auxiliary" was out and "Alliance" was in. Excitement ran high as a staff member changed the logo on the podium to reflect the bylaws amendment making the new title official. In and of itself, it was a simple act. Its implication, however, was enormous, as it represented almost a decade of debate between two strong factions, each of which had no problem in justifying its side of the name change issue.

Dissatisfaction with the name "auxiliary" did not emerge from a vacuum. It was synchronized with the changing roles of women in society, the growing number of male spouses in the Auxiliary, and the gradual decline in Auxiliary membership. What began as a trickle in casual conversation became a groundswell of serious discussion and debate among young and old members, male spouses, career women, and physicians. "What's in a name?" was no longer an inconsequential question. Every level of the organization was echoing the same concern, and national Auxiliary leaders could ignore it no longer. From the board of directors to the Long-Range Planning Committee to a special committee guided by professional strategic planners to the Bylaws Committee and back to the board of directors and on to the House of Delegates, the auxiliary/alliance question provoked thought and debate. In the final analysis, it might well have been the definitions of the two words themselves that turned the tide in favor of change.

In its study, the special committee carefully analyzed the definition of "auxiliary." As an adjective, it means "offering or providing help; functioning in a subsidiary capacity; supplementary." However, as a noun, the form in which it is used in the AMAA, "auxiliary" is defined by *Webster's Ninth New Collegiate Dictionary* as "an auxiliary person, group, or device, specifically; a member of a foreign force serving a nation at war; an auxiliary boat or ship; an auxiliary verb." "Alliance is defined as "the state of being allied; the action of allying; a bond or connection between families, states, parties, or individuals; an association to further the common interests of the members; union by relationship in qualities: affinity."

Auxilians who were perfectly comfortable with their name reasoned that since the purpose of the organization remained exactly the same, and since they did indeed serve in an auxiliary capacity (that of "offering or providing help"), there was no need for a name change. But proponents argued that in today's society, the term "auxiliary" conjures up the meaning "subsidiary, supplementary capacity." They objected to the perception of the traditional, secondary role of women in a male-dominated organization. To attract younger spouses, professional women, and males, name-change advocates contended that the organization must have a title expressing an equal, proactive role with organized medicine, not one suggesting subordination or subservience. In the end, the majority who voted for the change thought that the word "alliance" better describes what the organization is and does. Along with the new name came a tag line: "Physicians' spouses dedicated to the health of America."

Each issue of *Newsline* lists the new states and counties that have joined the "Alliance" bandwagon. At some point, each of these component organizations made a conscious decision to make its name consistent with the national organization. There is at least one good argument for consistency; it is certainly more convenient. But consistency for the wrong reasons does not justify changing the long-standing name of any organization. It is true that the AMAA is a federated organization made up of state and county components; however, no mandate requires any state or county to follow suit with the AMAA just for the name's sake. Perception of the organization's function, acceptance by its membership, compliance with the demands and wishes of the state/local medical societies—all are considerations that any state or county must take into account when making its decision about the name change. Convenience notwithstanding, the national organization understands and respects the decisions each individual organization makes.

According to Dadie Perlov, president of the Consensus Management Group and an expert on organizational management, "The new name is another tool that the organization has to promote itself and, more importantly, to promote its purpose.... This offers your organization a unique chance to grow—through membership and through strengthened partnerships with the medical society and within the community." She went on to point out, however, that "the bottom line is that a

person makes a membership decision in direct response to whether the organization delivers what he or she needs, wants, and expects, no matter what it calls itself."

Although Marylanders from the mountains of Allegany County to the eastern shores of Wicomico County have had their share of debates on the pros and cons of the issue, there has been no official consensus. Now is the time for the Auxiliary to the Medical and Chirurgical Faculty of Maryland to make its own decision. To do nothing is to maintain the *status quo*. Perhaps that is exactly what the majority of state members wish to do. To bring the issue to vote, however, is to make a conscious choice.

At its winter meeting in February, the state board of directors will make a recommendation regarding the name change. The recommendation will be brought before the House of Delegates for a final vote at its May 13 meeting. Since each delegate represents one of the 13 organized counties, it is imperative that these representatives know what their constituents think. Members of the state board of directors, all of whom are voting members in the House of Delegates, also need to know the wishes of state members. To make a decision representing the views of the majority of its members, President Georgia Lizas has requested that county members talk to their delegates and send in the questionnaire at the end of this article.

Auxiliary to the Medical and Chirurgical Faculty of Maryland is a proud and prominent name. It has served us well since 1949. (Just for the record, it is the longest of any state's title, and changing "auxiliary" to "alliance" would not alter that distinction.) "A rose by any other name may smell as sweet," but someone must take responsibility for keeping the same rose or changing its tag. Springtime will tell how blooms our rose.

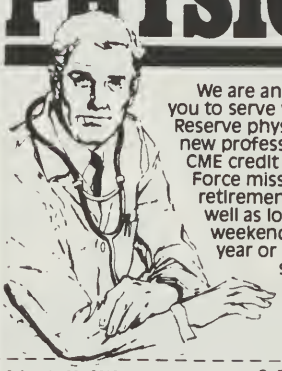
We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1994 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, and see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.



Doctor of the Day 1994

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 5:00 p.m. For more information, call Joyce Yensen at Med Chi's Legal Department, 410-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

PHYSICIANS

We are announcing opportunities for you to serve your country as an Air Force Reserve physician/officer. You can make new professional associations, obtain CME credit and help support the Air Force mission. For those who qualify, retirement credit can be obtained as well as low cost life insurance. One weekend a month plus two weeks a year or less can bring you pride and satisfaction in serving your country.

Med Chi Bicentennial Celebrations

Med Chi has already begun planning celebration activities for its bicentennial in 1999. If you have ideas or suggestions, please call Margaret Burri or Vivian Smith at 410-539-0872 or 1-800-492-1056.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA brings physicians' system reform concerns to Washington

The AMA continues to work with the Clinton administration and Congress to be sure health system reform preserves the physician-patient relationship. Since introducing the Health Access America proposal in 1990, the AMA has been at the forefront of the health system reform debate.

Many basic principles of Health Access America are mirrored in Clinton's proposal: universal coverage, a national package of health benefits emphasizing preventive care, an employer mandate and insurance reform.

"Both plans seek to build on what already works in health care, and both would make certain that the health care system works fairly for all Americans," said AMA Executive Vice President James S. Todd, MD, in testimony before the Senate Labor and Human Resources Committee.

Dr. Todd also took the opportunity to express concern that the plan does not include "the necessary level of physician participation on behalf of patients."

In testimony before the House Committee on Energy and Commerce, AMA Chair Lonnie R. Bristow, MD, detailed the AMA's differences with the Clinton proposal.

Complicated levels of government regulations built into Clinton's plan cause concern. Dr. Bristow said such levels will add new layers of bureaucracy through the proposed national health board and state-run health facilities.

The plan does not go far enough to limit medical liability costs through caps on non-economic damages and meaningful limits on attorney fees, Dr. Bristow said. More antitrust relief also is needed to allow physicians to adequately negotiate with large managed care organizations.

Dr. Bristow rejected the rigid budget caps and targets in Clinton's plan. Instead, he suggested developing prospective growth targets that establish flexible spending goals for the health care sector of the economy. These goals would identify specific cost difficulties and solutions. Targets would also allow for meaningful negotiations between physicians and the government.

Dr. Bristow expressed medicine's concern over Clinton's intent to regulate the percentage of physicians in primary care to 50 percent and to control allocation of residency slots.

The AMA's litmus test for the Clinton reform legislation consists of only two questions: Will patients have the freedom to obtain care from the provider and facility of their choice? And, can physicians provide necessary, effective and efficient care without undue restrictions on their clinical judgment?

Prepared by the AMA Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Fund-raising begins for new Physicians Health Foundation

A mass mailing has been sent to all AMA members and nonmembers requesting donations to fund the Association's newly established Physicians Health Foundation.

The new foundation, developed to provide economic assistance and retraining to disabled and unemployed physicians, will conduct a similar fund-raising campaign each year.

Physicians Health Foundation will work closely with state medical society-sponsored physician assistance programs, which actively will seek out and identify impaired or disabled physicians who need assistance.

Donations will provide economic help to disabled physicians until they are able to return to work or find other means of financial assistance.

The funds also will support and develop retraining programs for disabled physicians and expand on the AMA's current career placement service.

To make a donation, write AMA Physicians Health Foundation, Floor 8, AMA, 515 N. State St., Chicago, Ill. 60610. For more information, call Jean Owens, (800) 621-3211, ext. 5066.

AMA speakers bureau offers health system reform updates

Physicians and health policy professionals are available to deliver presentations through the AMA's Health System Reform Speakers Bureau.

The AMA speakers bureau has been established to strengthen and enhance organized medicine's health system reform position by giving presentations on reform to state and local medical communities as well as to the public.

AMA speakers are reaching numerous physicians and citizens across the nation, providing health system reform updates and explaining how each can help influence the reform process at the grass roots level.

The bureau also provides physicians with prepared speeches, talking points and other materials to help them with their own local presentations on health system reform.

For information on the AMA's speakers bureau or to schedule a speaker, call Marcia Moore, (800) 621-3211, ext. 4710.

HCFA responds to AMA, revises Medicare policy

Responding to concerns expressed by the AMA and other physician organizations, HCFA revised its policy to allow physicians to bill patients for noncovered visit services provided as part of routine physical exams.

Although Medicare does not cover routine physical exams, physicians were able to bill patients at regular fees for these services prior to May 1992. HCFA then revised its policy so physicians could not divide the visit into covered and noncovered portions.

The new policy, effective Oct. 30, enables physicians to bill Medicare for covered visit services. Payment is the lesser of the physician's actual charge or the Medicare-approved amount, if the physician accepts assignment. If assignment is not accepted, payment is the lesser of the actual charge or limiting charge.

The physician's charge to the patient for the noncovered portion of the E/M service is the difference between the physician's usual fee for a routine physical exam and the usual fee (not the Medicare-allowed amount) for the covered visit.

For information, call the AMA Dept. of Health Care Financing, (800) 262-3211, ext. 4514.

Prepared by the AMA Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

"Ron's Rule—I give myself one week to meet new people and start having fun on a locum tenens assignment. It hasn't failed me yet."

Ron Richmond, MD, joined the CompHealth locum tenens medical staff when he completed his residency. He wanted to travel. He loves to meet people. A little time off sounded really good. And he thinks being exposed to different types of medical practice will serve him well when he returns to his hometown to establish a community health center.

A singer. A board-certified family practitioner. A soft-spoken New Yorker. Ron Richmond knows...

It's a great way to practice medicine

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872
1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration opportunities in Maryland.

MMJ announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.

Information for AUTHORS

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

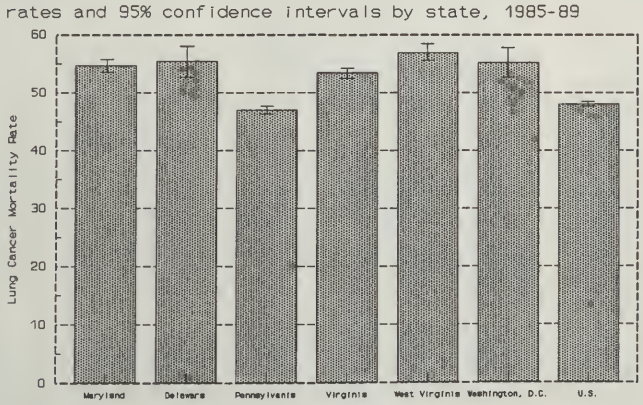
Chronic Disease in Maryland: Lung Cancer and Smoking

December, 1993

This is the first of two articles about chronic disease in Maryland. This article concentrates on lung cancer and smoking. The second article will focus on cardiovascular diseases and will be published in next month's newsletter.

Introduction



Eighty to ninety percent of lung cancer mortality in Maryland is caused by cigarette smoking[1,2]. Lung cancer due to smoking is one of the most preventable health problems in Maryland and the nation. President Clinton recently announced his intention to propose a significant increase in the federal excise tax on cigarettes to help pay for national health care reform. Also, Governor Schaefer has expressed a willingness to consider an increase in the state excise tax as a way to discourage tobacco use, in particular among youths. A twenty cent increase in the Maryland excise tax on cigarettes which took effect May 1, 1992, resulted in a significant decrease in smoking rates. However, adolescents, the group thought to be most affected by a tax increase, actually increased cigarette consumption in the months following the increase.

This report summarizes the most recent available lung cancer mortality data, and discusses trends in attitudes and behaviors toward tobacco smoking, especially among adolescents.

Lung Cancer

The average annual age-adjusted mortality rate for lung cancer in Maryland (54.6/100,000 in the period 1985-1989) is similar to the rates for most of the other states in the region[3] (Figure 1); Virginia (53.4/100,000) and Pennsylvania (47.0/100,000) have lower lung cancer mortality. Except Pennsylvania, mortality rates for states in the Mid-Atlantic region are higher than the national average (48.0/100,000).

Figure 1. Average annual age-adjusted lung cancer mortality rates and 95% confidence intervals by state, 1985-89

Rates are per 100,000 and age-adjusted to 1970 U.S. standard population
Source: National Cancer Institute SEER Program

Mortality rates for lung cancer during the same period vary considerably across Maryland (Table 1). The National Capital area (Montgomery and Prince George's counties) has the lowest regional rate (43.6), and Montgomery County has the lowest county rate (37.2) among Maryland's twenty-four local subdivisions. The Baltimore Metro area (Baltimore City and Anne Arundel, Baltimore, Carroll, Harford, and Howard counties) has the highest regional rate (60.2), and Baltimore City the highest of any jurisdiction (70.3).

The northwest area of the state (Allegany, Frederick, Garrett, and Washington counties) also has a lower rate (47.5) than the state as a whole. The two remaining regions in the state, the Southern and Eastern Shore areas, have rates (59.5 and 59.4, respectively) that exceed the statewide rate.

Lung cancer has been a primary concern in Maryland because it is the single largest contributor (25-30%) to our cancer problem, and Maryland ranks ninth nationally in lung cancer mortality. Our high lung cancer death rate is a key contributor to Maryland's current number two ranking in all-causes cancer mortality.

Cigarette Smoking

The single greatest cause of lung cancer is smoking[2]. It is estimated that 82% of all lung cancer cases in the state are attributable to either smoking or second-hand tobacco smoke. Also, people who smoke are at increased risk for respiratory disease and cardiovascular disease[4]. In 1990, 6,579 premature deaths in adults over 20 years old, and 31 premature deaths among infants less than one year old were attributable to smoking[1,5-9] in Maryland.

More than $1.2 billion was spent on smoking related illness, disability, and health care in 1990[1,8] in Maryland. This includes direct physician and nurse care, medications, and lost income and productivity due to illness or death.

Adverse health effects due to smoking can take 20 to 30 years or more to become manifest[3]. Adults who began smoking as teenagers have twice the risk of death due to cancer or heart disease than those who began smoking later in life; the risk is even greater compared to those who never smoked. Fifty and ninety percent of adult smokers have acquired their addiction to tobacco by the time they are 18 and 21, respectively[10]. The longer a person smokes, the greater the risk of illness and premature death. There are also short-term effects among the children of women who smoke during and after pregnancy, including low birth weight, sudden infant death syndrome, allergies, and upper respiratory infections[4].

The message that smoking adversely affects health is reaching the public. In recent years, smoking rates have been decreasing among all persons 20 years of age and older[6] (Figure 2); from 1989 through 1991, 23% of adults were currently smoking. The opposite is occurring among youths less than 20 years old[11]. If the current trends continue, more than 40% of students in grade twelve will be smoking in the year 2000 (Figure 2).

In May 1992, Maryland increased its excise tax on cigarettes to thirty-six cents per pack, up twenty cents from the previous level. This increase resulted in a reduction in cigarette smoking rates among adults in

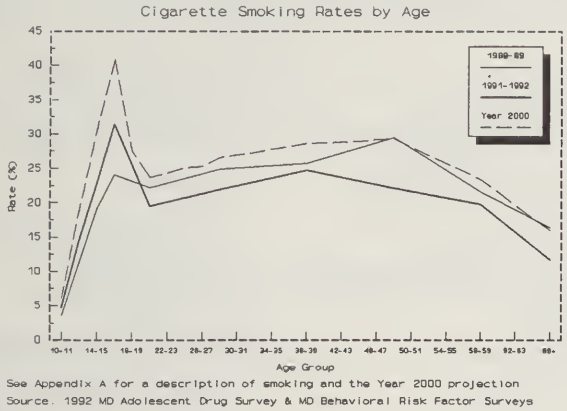


Table 1. Deaths and age-adjusted[1] mortality rates[2] for lung cancer by region, and political subdivision, Maryland, 1985-1989

Area of Residence	Annual Number of Deaths	Lung Cancer Death Rate
Maryland State	2,539	54.6
Northwest Area	199	47.5
Garrett	13	42.5
Allegany	59	49.5
Washington	63	43.8
Frederick	64	51.5
Baltimore Metro Area	1,473	60.2
Baltimore City	615	70.3
Baltimore County	440	53.4
Anne Arundel	236	66.3
Carroll	51	44.7
Howard	49	48.1
Harford	82	59.1
National Capital Area	527	43.6
Montgomery	256	37.2
Prince George's	271	51.9
Southern Area	92	59.5
Calvert	21	52.6
Charles	37	60.6
St. Mary's	34	63.7
Eastern Shore Area	248	59.4
Cecil	41	58.8
Kent	15	53.6
Queen Anne's	18	48.9
Caroline	19	61.7
Talbot	23	54.3
Dorchester	28	63.8
Wicomico	54	64.3
Somerset	22	76.8
Worcester	28	55.6

1 Adjusted to the total U.S. 1970 population by the direct method.

2 Mortality rates per 100,000 population.

the second half of the year[6]. For adolescents, the rate of smoking increased in the same period[11]. The recent upswing in tobacco use among adolescents will result in an increase in tobacco-related morbidity and mortality as this group ages.

In 1992, 31% of Maryland twelfth-graders were smoking at least once a month; this is an increase of 4% from 1990[11]. Tobacco is used as a "gateway" drug by teenagers; adolescents who smoke are more likely to use other substances, such as alcohol, cocaine, heroin and marijuana.

Many young people are also aware of the adverse health effects of smoking. Eighty-nine percent of twelfth grader students know that tobacco, in any of its forms, is a proven cause of cancer, and 60% believe cigarettes are very dangerous[11]. The problem seems to be two-fold. The first is peer pressure -- there is little one can do about this, because billboards and other advertisements continue to portray smoking as desirable behavior. Second, although the health risks are recognized, there are also beliefs that occasional smoking will do no harm, that smoking for a few years is all right, and that quitting smoking is easy. This latter attitude may be modifiable by an adolescent's physician.

Strategies

The most effective method of lowering lung cancer mortality rates in the future is preventing the uptake of smoking by adolescents and getting those who already smoke to quit. Physicians can be an excellent source of counseling for young people about the risks of smoking. Physician attitudes toward smoking may be subtly reinforced in the office waiting room by subscribing only to magazines which decline tobacco advertising; such journals are listed in appendix B. Also, pharmacists can refuse to sell tobacco products in their pharmacies.

In addition, all citizens can let their legislators know they support strategies, which effectively prevent the initiation or continued use of tobacco products by youth, as follows:

1. Maintain and strengthen knowledge about the adverse health effects of smoking through anti-smoking media campaigns and school-based prevention education in grades K-12.

2. Limit adolescents' access to tobacco products by placing vending machines at sites frequented only by adults, by placing all tobacco products not dispensed by machine behind counters and accessible only by sales clerks, and by eliminating tobacco company promotions which feature free or reduced price tobacco products.

3. Provide regular increases in the cigarette excise tax and establish an excise tax on other tobacco products, including smokeless tobacco.

4. Require tobacco vendor licenses which provide penalties for sales to minors, and strictly enforce existing sales laws.

5. Protect infants, children and adolescents from exposure to second-hand tobacco smoke through the introduction of stronger clean indoor air legislation, regulations, policies and home behavior.

Appendix A. Smoking Rates and the Year 2000 Projection

Adolescent smoking was defined as any smoking in the last 30 days[11]; adult smoking was defined as "ever smoked 100 cigarettes and smoking now=yes"[6] . The Year 2000 projection based on the state population as of 1992; that is, the projected smoking rate for people 18 or 19 years old in 1992 will be the 26-27 age group in 2000. The projection is calculated from the 1992 rate and the trends from 1988-89 to 1991-92, and assumes the trends among adolescents will not change without external pressure, e.g. an increase in the excise tax, and the trends among adults will not change towards increased smoking.

SOUND PROTECTION

Choosing a professional liability insurer is a major decision–too important to play by ear.

Princeton Insurance Company's high-quality investment portfolio and our conservative approach to loss reserving have made us the choice of 22,000 in the medical and health care community.

We're not just blowing our own horn. Standard & Poor's has awarded us a claims-paying ability rating of "A."

That's sound protection through financial strength and stability.

Princeton. It's worth it!
